The penicillin amendment to the Food, Drug and Cosmetic act was passed unanimously after recommendation to the congress by the federal security administrator and endorsement by the industry and interested scientific groups. It continues the predistribution testing by the administration of samples of every batch of penicillin manufactured, previously provided under wartime controls, to assure purity and standard potency. Samples of insulin and insulin-containing drugs tested under the insulin amendment, providing similar predistribution certification, numbered 578.

Drug regulations were amended to require labelling with ade-

OPIUM SMOKING equipment seized in a raid on a Los Angeles den during 1945. Improvised bowls, shown under inspection, were made of small vases in which holes had been drilled at the end, and stems were of rubber hose

quate directions and warnings on all drugs suitable for self-administration, limiting the use of the prescription legend to preparations that cannot be used safely without a physician's direction.

In the 595 drug and device seizure actions for 1945, involving 719 alleged violations, 12 charges were made of danger to health; 282 of false and misleading claims; 22 of failure to bear mandatory labelling; 25 of filth and decomposition; 295 of violation of official or professed standards; 82 of deceptive packaging or short measure; and 1 of containing a nonpermitted coal-tar colour. Nine injunctions were requested and 94 criminal prosecutions were instituted. (P. B. D.)

**League of Nations.**—*Western Europe including Spain and Italy.*—Directives to control the narcotic traffic were issued by Allied military authorities and these proved to be of great value at a time of much difficulty and confusion.

National controls in France and Belgium functioned throughout World War II and needed little reconstruction. Denmark, the Netherlands and Norway sent in full returns for 1944. Their controls functioned without interference. On the contrary, in Spain, a neutral country not exposed to the destruction of war, the situation was highly unsatisfactory. In spite of repeated reminders, the Spanish government, although a party to the 1925 and 1931 conventions, produced no actual statistics and persistently imported narcotic drugs in excess of estimates.

The Allied Civil Affairs divisions in Italy proceeded to place national controls in good order.

**Germany.**—As Germany imposed a special responsibility for the military governments, an attempt was made to institute uniform control in all zones to report to an inter-Allied control commission in order to meet the requirements of the international conventions. During the war Germany produced nearly all of its morphine by manufacture from poppy straw. This situation was viewed with concern, since to establish adequate domestic control, the growth of the poppy would have to be licensed. Poppy cultivation had spread throughout Germany.

Narcotic controls in the British, French and U.S. zones were organized. After World War I, the sudden and alarming increase in illicit traffic and addiction was believed to have been due partly to leakages from military supplies.

**Eastern Europe.**—The U.S.S.R., important as producer, manufacturer and consumer, controlled its narcotic traffic satisfactorily.

**Near and Middle East.**—Turkey, the largest producer of opium for medical needs, was the important source for the Allied nations for raw materials. Conditions in Iran, which had never ratified the 1925 convention, became worse. Addiction was reported to have reached the highest level in the history of the country. Sixty-six members of the lower assembly petitioned the government of Iran for complete prohibition of the production of opium. The Iranian government issued orders to remove all officials who were opium smokers.

**The Far East.**—The situation in India continued about the same with the production of opium around 350 long tons and with no figures available from the native states. This opium is sold through licensed government shops throughout India and became the source of considerable illicit traffic to the United States, the United Kingdom and Canada.

**Japan.**—Approximately 2,000 army and navy civil affairs officers were given lectures and briefed as to the necessity of bringing the opium traffic under control in Japan and in those areas formerly dominated by Japan. General MacArthur issued orders to the Japanese to account for production, distribution and consumption of all narcotic drugs after 1930.

The French government declared it would conform to the British and Dutch announcements that the sale of smoking opium be prohibited in all territories recaptured from the Japanese.

**Future Organization and Plans: The San Francisco Conference and the Preparatory Commission of the United Nations.**—At the San Francisco conference it was decided, as had been contemplated in the Dumbarton Oaks proposals, that specialized agencies operating under existing treaties of which the Permanent Central Opium board is one should be brought into relation with the new United Nations organization. In the appropriate committee of the conference a statement was made by the U.S. representative to the effect that the U.S. delegation wished to go on record as strongly favouring the bringing of such existing or future agencies into relationship with the Economic and Social Council. It was supported by the representatives of Canada, China and India, and embodied in substance in the rapporteur's report which was at later stage supported by the representative of the United Kingdom.

**Dyestuffs.** The efforts of the dyestuff industry in the U.S. for the first eight months of 1945 were concentrated upon the production of adequate quantities of military dyes to satisfy government requirements. Production of many of the restricted vat colours had to be maintained at a rate approximately 200 times the normal prewar demand. The industry recognized the fact that should the war end suddenly, there would be sizable stocks of these colours on hand which would be augmented considerably by material in process. This could not be avoided because of the time required in manufacturing a dye and the inability to change over once the operation is under way. That was the situation on Aug. 20, 1945, when the War Production board rescinded conservation order M-103. While this made material available for reconversion and civilian use the results could not be felt immediately and it left the industry with the problem of disposing of heavy inventories of military colours. Their exceptional fastness made them particularly desirable for heavy-duty fabrics and dyeing formulas for peace-time shades were developed incorporating these colours.

Reconversion did not present the difficulties confronting other highly specialized industries. No major mechanical changes were required since existing equipment could be used for the manufacture of civilian dyes. The colours most urgently needed were first put into production and by the end of the year practically all groups of colours were again being manufactured. However, production capacity for certain types of colours was insufficient to take care of the heavy demands of consuming industries resulting in shortages which could only be overcome by expansion of facilities. Research was continued in the development of new and improvement of existing colours. New application procedures were made available which simplified the dyeing and printing of multi-fibre and other materials with fast colours.

Figures for the year 1944 show that production of all types of dyes amounted to 151,651,000 lb. compared with 144,013,000 lb. in 1943 and 169,000,000 lb. in 1941, the year of highest production in the United States. Greater military requirements for dyes in 1944 accounted for the large increase in total production while civilian consumption was rigidly restricted. Two factors which influenced production in 1941, heavy civilian demand and stock-piling, were not present in 1944. Sales of all dyes were 150,049,000 lb., valued at \$110,748,000. The production of vat colours in 1944, exclusive of indigo, amounted to 40,837,000 lb., an increase of 4,503,000 lb. over 1943. Sales of vat dyes were valued at \$47,337,000, direct dyes at \$17,109,000 and acid dyes at \$13,293,000. Production of direct dyes declined 2,977,000 lb. and acid colours increased 2,724,000 lb. over 1943. Vat dyes accounted for 38.3% of the total 1944 dye production, direct dyes for 19.7%, sulphur dyes for 11.9% and acid dyes 11.4%. The remaining 18.7% was fairly equally divided among other miscellaneous dyes. The quantity

of dyes classified according to the colour index number reported by the U.S. tariff commission increased 2.6% compared with 1943; those dyes designated by foreign prototype number increased 31% while the unclassified dyes decreased 8%. The large increase in dyes having foreign prototypes was partly due to the manufacture in the United States in 1944 of certain types of dyes that were formerly imported. (A. G. BN.)

**EAC:** *see* EUROPEAN ADVISORY COMMISSION.

**Eaker, Ira C.** (1896— ), U.S. army air officer, was born April 13 in Field Creek, Tex. He studied at the University of the Philippines, Columbia and Southern California universities and was commissioned as second lieutenant in the infantry reserve in 1917. In 1929, he was co-pilot in an army plane which established an endurance flight record of 150 hr. and 40 min., and some years later he made a cross-continent "blind flight." In Jan. 1942, he was made brigadier general. He was appointed chief of the U.S. bomber command in the European theatre of war in the summer of 1942, and on Feb. 15, 1943, Eaker, having been advanced to the rank of major general, became commander of the 8th U.S. air force, succeeding Maj. Gen. Carl Spaatz. Promoted to lieutenant general, Eaker stated in Oct. 1943, that the task of the air force for the winter would be to destroy Germany's production and transportation facilities so that invasion could be carried out with fewer casualties. On Dec. 28, 1943, Gen. Eaker was appointed commander of all Allied air units in the Mediterranean theatre. On Jan. 2, 1944, he announced that the 8th air force had made 64,000 offensive sorties over Europe in 1943, dropping 55,000 tons of bombs and shooting down 4,100 German fighter planes. He estimated that German fighter plane production had been cut by nearly 40% during the year. Eaker disclosed (March 25, 1945) that his command lost more than 20,570 men and 2,050 heavy bombers in 1944. On April 24, it was announced that Eaker had been named deputy commander of the army air forces and chief of the air staff.

**Ear, Nose and Throat, Diseases of.** *Progress of the Surgical Treatment of Deafness.*—Success with the labyrinth fenestration or window operation for otosclerosis continued without a radical change in the operative technic. Lempert continued to use the cartilaginous plug or stopple in the fenestra in the majority of his cases with excellent results.

Cases must be properly selected to obtain hearing improvement to a practical level. The pre-operative deafness must not be of too great a degree to obtain results that are satisfactory to the patient. The high percentage of successful results make this procedure a practical means of improving an otherwise incurable condition.

**Penicillin Therapy in Otorhinology.**—Penicillin sodium was found to be of definite value in the treatment of sinus and ear infections. It was instilled directly into the maxillary sinuses in a series of cases, and in others displaced into the ethmoid sinuses. In the ear cases it was driven into the middle ear by pressure.

These methods hastened recovery of the acute cases, shortening the morbidity to three days instead of the usual week to ten days. It was not so striking in the chronic running ears, however.

The use of penicillin applied directly to infection in otorhinologic practice is a definite step forward though not as dramatic as in other types of fulminating infections where the drug is utilized intramuscularly or by vein.

Sinuses infected with penicillin sensitive organisms respond

dramatically to treatment with this drug, whether acute or chronic. The patients with undue sensitivity of their mucous membranes usually gave the poorest results; hence the outlook in such cases should be considered poor. Patients suffering with nasal polyps have also responded poorly.

The effect of noise and change of barometric pressure on the aviator are for the most part reversible. Despite the noise and aero-otitis media, where the injuries from these causes have not been too great, there was a great tendency for recovery. Vulnerability of the acoustic apparatus was found to be variable, though extreme vulnerability to noise is not great. The dips and notches found in the audiometer studies were found above the conversational range and did not produce subjective loss.

Hearing loss produced by anoxia was never found to be sufficient to constitute a problem. The auditory mechanism is extremely resistant to anoxia though the latter condition ought not to exist since every airman has his own oxygen supply and knows how to use it. Deafness in airmen thus does not offer a problem, and this augurs well in the selection, care and protection of air force personnel.

**Easley, Claudius Miller** (1891-1945), U.S. army officer, was born July 11, at Thorp Spring, Tex. After graduation from Texas A. & M. college in 1916, he entered the regular army and served at various camps in the U.S. In 1921, he was sent to the Philippines for a three-year period of duty in Manila. He was later graduated from the Army War college, 1940, and then was assigned to the war department general staff in Washington. In early 1942, he was assigned to Camp Claiborne, La., and was then transferred to overseas duty as assistant commander of the 96th infantry division. Brig. Gen. Easley, who participated in the Leyte and Okinawa campaigns, was killed in action on Okinawa, June 19, a day after Lt. Gen. Simon Bolivar Buckner, Jr., had been fatally wounded in the same area, according to a war department announcement.

**East Africa, British:** *see* BRITISH EAST AFRICA.

**East Indies, Dutch:** *see* NETHERLANDS INDIES.

**East Prussia.** Formerly the easternmost province of the German land of Prussia. Area 15,061 sq.mi., pop. 2,256,349. East Prussia was separated from the remainder of the German reich after World War I by the Polish province of Pomorze, generally known as the Polish Corridor. According to the official figures of the Prussian census of 1910 the population in the southern part of East Prussia showed a strong Slav admixture, and in some districts in the southeast even a Slav majority. In 1919 the Poles based their claims for East Prussia on these considerations of nationality, but also upon considerations of strategy. A plebiscite arranged by the peace conference in 1919 in the nationally mixed districts decided in favour of Germany. Yet the strategic considerations in favour of Poland retained their validity, as was clearly shown when the German armies ad-

vancing from East Prussia precipitated Poland's defeat in 1939 and made Poland's access to the Baltic sea militarily untenable. For these reasons Poland claimed East Prussia during World War II. An additional reason was the socio-political character of the land: East Prussia was regarded as the centre of the economic and political power of the militaristic Junker class. In the period of the German republic (1918-33) the Junkers succeeded in maintaining their former position and even in increasing their hold upon Germany after the election of Field Marshal Paul von Hindenburg as president of the German reich.

At the Berlin conference in 1945 Russia, the United States and Britain decided that Königsberg, the capital of East Prussia and an important port, and all the territory east and north of it were to be incorporated into Russia, while the southern part of the province was put under Polish administration. The German inhabitants of East Prussia were to be transferred to Germany and to be replaced by Slav settlers. (H. Ko.)

**Economic Association, American:** see SOCIETIES AND ASSOCIATIONS.

**Economic Defense Board:** see FOREIGN ECONOMIC ADMINISTRATION.

**Economic Development, Committee for:** see COMMITTEE FOR ECONOMIC DEVELOPMENT.

**Economics.** Economic research in the United States throughout 1945 was focused predominantly upon public policy. The Committee for Economic Development was concerned chiefly with the economic impact resulting from the relaxation of wartime controls. The Brookings institution continued its integrated studies pertaining to postwar readjustment and reconstruction with a contribution on postwar fiscal requirements. The American Farm Economic association conducted a prize essay contest on the general topic of a price policy for agriculture consistent with economic progress and stable incomes from farming. The Cowles commission published a detailed case study of the impact of price controls on business. The special committees of the American Economic association surveying the undergraduate teaching of economics and the academic training of economists made significant forward strides during the year. Among the government economists, perhaps the most outstanding contributions were those made by the department of commerce in the determination of the component elements of factory pay rolls for purposes of wage-price policy. Somewhat less scientific economic studies were issued in reports of the War Production board justifying increased wage payments without increases in price ceilings. Economists of the Federal Reserve board contributed a series of studies related to price and monetary controls.

The National Bureau of Economic Research issued substantial studies in business financing, dealing with the pattern of corporate financial structure and corporate cash balances that were especially rich in information and provided a significant source of raw materials for further study. A group of scholars familiar with the economic development of southeast Europe presented for the first time a comprehensive analysis of regional co-operation in nutrition, food and agriculture, industrial development, transportation, marketing and finance, concluding that the chief cause of the low standards of living and production has been the serious state of agricultural overpopulation in Bulgaria, Greece, Rumania, Poland and Yugoslavia. This factual survey became especially timely as this area of sovietization again became a focal point of economic irritation. With the growth of postwar communism in Europe and Asia, many of the studies dealing

with the expansion of communism by annexation and creation of puppet governments assumed greater interest. Full employment as a central topic of study again assumed the importance held throughout the prewar depression years as threats of demobilization unemployment loomed more ominously after the end of World War II. Despite the numerous articles on this subject in professional journals, no outstanding contribution on the solution of postwar unemployment appeared during the year.

After the signing of the charter of the United Nations organization, a greater stimulus was given to explorations in the field of international trade. Out of the British loan negotiations issued much new information relating to the economic conditions within the United Kingdom following the war. The British White Paper on war finance contributed substantially to the understanding of British national incomes. Throughout Great Britain, the issues surrounding the extension of nationalization of industries contemplated by the Labour government after the elections received serious attention in economic circles, and aroused wide popular interest. The permission extended U.S. air lines to establish world routes of passenger travel became the basis for studies of rates, traffic and international economic co-operation.

In the field of economic theory, the greatest attention was devoted to mathematical analysis, economics of the individual firm, econometric studies and institutional theory. Numerous publications dealt with economic systems, but rare indeed was the study that showed lack of an emotional bias. With the exception of statistics, few new college textbooks in economics were published during the year.

**Ecuador.** A west coast republic of South America, astride the equator, from which it is named. Area, 103,415 sq.mi.; the Galápagos Islands, a dependency in the Pacific, have an area of 3,029 sq.mi. Pop. (1944 est.) 3,171,367; about 30% are Indians, 40% mestizo and 28% white. The capital is Quito (pop., 1944 est., 165,924). Other important cities, with 1944 pop. estimates, are Guayaquil, the principal port (172,948); Cuenca (52,519); Riobamba (27,459); Jipijapa (22,097); Vinces (21,860); Chone (21,834); Ambato (21,692). President in 1945, José María Velasco Ibarra.

**History.**—Ecuador is governed by a new constitution, dated March 5, 1945, adopted by a constituent assembly elected after the revolution of May 28, 1944, which ousted Pres. Carlos Arroyo del Río. The constitution established a unitary republic with a president elected by direct, secret vote for four years (ineligible for the term following), a unicameral congress chosen in part on an elaborate basis of functional representation, and a judiciary headed by a supreme court of justice. The constitution contains several novel features, including representation in various bodies by the "political trends" of the right, centre and left. The bill of rights is elaborate and reflects a high degree of government regulation.

Members of the constituent assembly in mid-January sharply criticized U.S. Senator Kenneth McKellar's proposal that the United States buy or lease the Galápagos Islands for a naval base. Lt. Gen. G. H. Brett and Rear Adm. H. G. Kingman conferred in Quito March 15 with the president and foreign minister regarding postwar use of Galápagos bases. It was reported Sept. 17 that a preliminary agreement had been reached for U.S. use of the Galápagos in return for an Export-Import

BALSA RAFT made up by natives in Ecuador to be floated down the river

bank loan of \$20,000,000; on Sept. 25 it was reported that the U.S. would return the mainland base at Salinas to Ecuador. The foreign office announced Feb. 3 that Ecuador had considered itself at war with Japan from Dec. 7, 1941. Ecuador signed the United Nations pact Feb. 14 at Washington, D.C. The foreign office on Feb. 15 announced agreement with Peru over the last differences affecting their mutual boundary controversy. Officials formally occupied the border town of Vargas Guerra July 5 in accordance with the settlement. The presidents of Peru and Ecuador exchanged letters July 17 dealing with the settlement. The U.S.S.R. chargé in Mexico announced on June 28 that diplomatic relations between his country and Ecuador had been established. Domestic politics continued disturbed in 1945. Pres. Velasco threatened in late February to resign unless certain changes were made in the then pending constitution; he later declared his disapproval of the constitution and absented himself from Quito when it was promulgated. The president refused to accept a collective cabinet resignation March 11 and again July 30. An alleged attempt at revolt by army officers was suppressed Aug. 3. Amnesty was granted Aug. 14 to various former members of the administration. Ecuador had its first experience with woman suffrage in municipal elections, which reflected a conservative trend, on Nov. 25.

**Education and Religion.**—School enrolment in 1944 was reported at somewhat less than 300,000. The constituent assembly passed a bill Feb. 17 aimed to remove illiteracy, estimated at 62%, by 1950; the movement was begun in 1944 by the national newspapermen's union. Pope Pius XII on Jan. 8 received Manuel Sotomayor, new Ecuadorian envoy to the Vatican.

**Finance.**—The monetary unit is the sucre, valued in Dec. 1945 at 7.26 cents (U.S.). The 1945 budget balanced at 369,300,000 sucres as against an amended budget total for 1944 of 239,388,890 sucres. The chief increases were for highways, defense, agriculture and social welfare. It was estimated that a loan of 85,000,000 sucres would prove necessary to complete the financing. The government obtained a loan of 6,500,000 sucres May 15 from the Banco Central (alleged by the bank to be under pressure) for airport and other improvements. Government debt to the Central bank was consolidated by decree July 10 at 158,343,349 sucres with interest at 2% and amortization over 34 years. Central bank foreign exchange accounts June 30 were 121,684,876 sucres (Dec. 31, 1944, 178,737,303).

Bills in circulation June 30 were 321,995,770 sucres (Dec. 31, 1944, 312,994,595). Export-Import bank loans to Ecuador totalled \$15,200,000 by June 15, with \$4,900,000 outstanding. Total lend-lease advances to Ecuador were \$4,847,000.

**Trade and Communication.**—Total imports in 1944 were valued at \$23,500,000, of which 52% were supplied by the U.S.; total exports were valued at \$33,100,000, of which 57% went to the U.S. Chief imports, in order of value, were cotton and manufactures, foodstuffs and chemicals and pharmaceuticals; chief exports were rice, straw hats, cacao beans, rubber, coffee and balsa wood. Coffee exports in the first eight months of 1945 amounted to 3,234 short tons as against 6,864 short tons in the same period of 1944. Rice exports in the first half of 1945 were 11,407 short tons valued at \$1,527,405 (same period in 1944: 31,279 short tons valued at \$3,991,501). Rubber exports in the first half of 1945 were 1,465,303 lb. valued at \$657,962 (same period in 1944: 1,605,738 lb. valued at \$638,329). Total exports in the first four months of 1945 were down 32% as against the same period in 1944 but exports to the U.S. dropped only 12½%.

Railway mileage was 765 and had all been nationalized. Highway mileage was 4,280 of which 2,730 mi. were termed all-weather. Pan American Airways furnished international plane service. Railway freight and passenger rates were increased about 20% July 1 to provide for purchase of rolling stock and freight-handling equipment.

**BIBLIOGRAPHY.**—Lilo Linke, *Andean Adventure, A Social and Political Study of Colombia, Ecuador, and Bolivia* (1945). (R. H. FN.)

**Eden, (Robert) Anthony** (1897— ), British statesman, was born June 12, and was educated at Eton and at Christ Church, Oxford. After service in World War I from 1915 to 1918, he contested the Spenny-moor division of Durham in 1922, and in the following year he was elected for Warwick and Leamington, which he thereafter continued to represent. He was lord privy seal and a privy councillor, 1934, and in 1935 he entered the cabinet as minister without portfolio for League of Nations affairs, holding this post until the following December, when he became foreign minister. Disagreement with Prime Minister Chamberlain over the latter's appeasement policy led to his resignation Feb. 20, 1938. Upon the outbreak of war Sept. 3, 1939, he re-entered Chamberlain's cabinet as dominions secretary, and on Dec. 23, 1940, he was appointed to the foreign ministry in Winston Churchill's cabinet.

In Nov. 1944, he provoked a storm of controversy by voicing Britain's opposition to Count Carlo Sforza as Italian foreign minister. He told the house of commons in December that Great Britain was not trying "to impose a king with British bayonets on the Greek people," but added that neither was the government opposed to a regency. In 1945, Eden attended the Crimea, the San Francisco and the Potsdam (Berlin) parleys but yielded his place as foreign secretary at the latter conference to Ernest Bevin after the results of the British national elections were announced July 26.

**Education.** The end of hostilities in World War II was marked in the United States by the announcement within a few weeks of each other of the first use of the atomic bomb, of the report to the president on a program for postwar scientific research and of the report of the Harvard Committee on General Education in a Free Society. The atomic bomb was hailed as the fruition of teamwork in scientific research at government expense. At the same time, however, it was recognized in a resolution adopted by the Conference on Science, Philosophy and Religion at its meeting in New York in Aug. 1945 that the atomic age requires the collective thinking of

scholars, men of letters and leaders of the economic and philosophical and religious thought so that atomic power may become an asset rather than a liability in modern civilization. The report to the president presented a strong case for government aid for scientific research. The Harvard report emphasized the importance of general education which would balance the threatened overemphasis on the sciences in a technological age. To these three major concerns must be added the widespread interest in international educational and cultural relations. While these issues were outstanding there was the continued interest in educational problems which were in large measure, but not wholly, due to war conditions—teacher shortages and salaries, federal aid for education, child welfare, the future of the colleges, the education of returned veterans and compulsory military training.

**Teacher Shortages and Salaries.**—The prospects that the supply of teachers would be improved at the opening of the school year 1945-46 were not bright. According to a report issued by the United States office of education 300,000 teachers left the schools after Pearl Harbor. At the opening of the school year 1944-45, 168,000 or 20% of the teachers were new to the profession; in rural schools one in every three or four teachers was new as compared with about one in 18 in schools in the larger cities. The issuance of "emergency certificates" after very short periods of training rose in the four years after Pearl Harbor from 2,305 to 69,423. This situation became nation-wide when the New England states began to be affected by the shortage and when New York city for the first time in a quarter of a century was faced by the same condition.

Efforts were made to maintain the supply of teachers by increasing salaries, but the increase of about 15% after 1939 was incommensurate with the rise in the cost of living; 28,000 teachers received less than \$600 and 197,000 less than \$1,200. The averages for elementary and high school teachers in communities of different sizes were as follows: in those with 2,500 to 5,000 population \$1,537 and \$1,885; in the 10,000 to 30,000 group \$1,780 and \$2,235; and in cities of more than 100,000 \$2,602 and \$3,214 respectively. The Harvard committee in the report discussed later, recognizing that "everything finally depends on the teacher's quality of mind and spirit," also recognized that the improvement of education in schools and colleges depends upon higher salaries, smaller classes and "above all, perhaps, a more rounded, longer, more continuing education of teachers."

**Federal Aid for Education.**—Differences in the preparation and salaries of teachers were but one example of the failure to provide equality of educational opportunity throughout the United States. Added arguments for federal aid for education accumulated. The 1940 census listed 3,000,000 adults who had never been to school, more than 10,000,000 adults who were virtually illiterate and nearly 2,000,000 children aged 6 to 15 who were not attending any school. To these facts there was added the rejection under Selective Service of nearly 5,000,000 young men for educational, physical and mental deficiencies. The existence of widespread inequalities was revealed in the report of a study made under the sponsorship of the United States office of education, the American Council on Education, the National Education association and other organizations and financed by the General Education board. The report, *An Inventory of Public School Expenditures in the United States*, by John K. Norton and Eugene S. Lawler, published at the end of 1944, pointed only to one conclusion—the need of federal aid for education.

Bills to this end were introduced in congress in the first half of 1945. The Thomas-Hill-Ramspeck bills (S.181—H.R.1296) proposed a federal appropriation of \$300,000,000 annually of which a permanent contribution of \$100,000,000 was intended to equalize educational opportunities among and within the states, and \$200,000,000 were to be used for emergency aid for one or

more of the following purposes: payment of teachers' salaries, employing additional teachers to relieve overcrowded classes, adjusting salaries to meet increased cost of living and keeping schools open not less than 160 days a year. The equalization fund was to be apportioned to states according to financial need as measured by the number of persons 5 to 17 years of age and total income payment in each state. The emergency aid was to be apportioned according to the number of pupils in average daily attendance in the public schools of each state. The bills reserved the control of education strictly to the states and local systems.

To allay the fear of federal control as an accompaniment of federal aid, a report was issued on *Federal-State Relations in Education*, prepared under the sponsorship of the American Council on Education, the Educational Policies commission of the National Education association and the American Association of School Administrators.

**The United States Office of Education.**—In line with a recommendation made by President Roosevelt in his last budget measure Dr. John W. Studebaker, U.S. commissioner of education, proposed in the *Annual Report of the United States Office of Education for the Fiscal Year 1944* a plan for the reorganization and expansion of the United States office of education which would raise the total personnel from 209 (105 professional and 104 clerical) to 1,353 (643 professional and 710 clerical) and the budget from \$1,001,577 to \$1,641,700. The report emphasizes the fact that the purpose of the reorganization is not to exercise control over education in the country but to use a larger and better prepared staff to collect information on education in the U.S. and abroad, to formulate and recommend standards for the improvement of all types of education, both public and private, to conduct surveys and furnish consultant services on problems of education (organization, administration, finance and curriculum) and to co-ordinate government activities in education. The necessary appropriations were made by congress and the reorganization was begun in the second half of 1945.

The end of hostilities brought to a close the war training programs in schools and colleges directed during the war years by the United States office of education and supported by federal funds; 12,000,000 men and women were trained for essential war jobs at a cost of \$500,000,000. The activities included the engineering, science and management war training program under which nearly 300,000 men and women were trained in colleges and universities both on the campuses and in co-operation with industrial concerns. At the high school level vocational training was offered in automotive services and aviation, electrical, machine shop, radio, shipbuilding and welding courses and in rural areas in improving food production.

A commission was appointed during 1945 to undertake a two-year study of educational techniques used in the army and navy. The study was to be directed by Dr. Alonzo G. Grace, commissioner of education of Connecticut, for the commission, appointed under the sponsorship of the American Council on Education with a grant of \$150,000 from the General Education board and the Carnegie Corporation of New York. The subjects to be studied included: the procedures used in the selection, classification and assignment of personnel; curriculum construction adapted to special jobs; teaching methods; use of visual aids; training programs for leadership and for teachers; and methods of physical and health training.

**Study of American History.**—The movement to emphasize the importance of the study of American history continued. In New Jersey two-year courses in the subject were made compulsory in public high schools by action of the state legislature. In the New York state legislature proposals were presented to make

Above, left: GERMAN YOUTH attend a class in literature under the re-education program at a prisoner of war camp near Carentan, France. More than 17,000 students, enrolled in 1945, studied religion, languages, arts and commerce at the camp before returning home to Germany

Above, right: BURMESE CHILDREN watch with total absorption as a classmate goes through the alphabet. Classes were resumed in 1945 after three years of Japanese occupation during which primary education was ignored

Left: CADET NURSES of St. Joseph's hospital, Chicago, Ill., attending class in the operating theatre to observe actual surgery in 1945. They were part of a group registered for a three-year course sponsored by the U.S. public health service

Below: GRAND AMPHITHEATRE of the Sorbonne in Paris, filled with men and women of the U.S. army, who were being addressed by U.S. ambassador Jefferson Caffery. They studied the French language there under the army educational program in 1945

the study of prescribed courses in American history a requirement for graduation from public and private elementary and high schools. At the University of Maryland, College Park, Md., the study of American history, government and literature was made compulsory for all students in the first year of a new curriculum which went into effect in Sept. 1945. In the college of arts and sciences of Ohio State university, Columbus, O., special emphasis was placed upon the study of American civilization (history, political science, English and economics) throughout the four-year undergraduate course. During 1945 a survey was begun by the Committee on American Literature and Culture of the National Council of Teachers of English to discover the extent to which American literature is taught in colleges and universities in comparison with the literature of other countries.

**Child Welfare.**—See CHILD WELFARE.

**Higher Education.**—The war affected colleges and universities more seriously than any other branches of education. The result of a survey prepared for the committee on education of the house of representatives revealed the grave financial situation of these institutions because of the drop in enrolments and the abandonment of the army and navy training programs in many of them. The group recommended federal aid of \$25,000,000 a year as long as the emergency continued, the grants to be made to institutions when full-time enrolment dropped to 60% of the normal enrolment. Other proposals recommended were the payment of grants-in-aid for repair and replacement of permanent equipment and for construction of buildings, increased exemptions from income tax because of gifts made to colleges by corporations and individuals, and scholarship grants to students. The recommendations were embodied in H.R. 3116 under which aid would be given to public, nonsectarian and sectarian private institutions of higher education approved by the Association of American Colleges. The proposed appropriation of \$25,000,000 for the first year would be administered by a newly created Commission on Emergency Federal Aid to Higher Educational Institutions. While federal aid was favoured by college presidents as an emergency measure, 56% declared themselves opposed to government subsidies as a long-range policy when the question was discussed at a meeting of the Association of American Colleges held in Atlantic City.

**Curriculum Reforms at Harvard and Yale.**—An extensive report, prepared by a committee appointed by President James Bryant Conant in 1943 to consider the problem of general education in both the school and the college, was published by Harvard university, Cambridge, Mass., under the title *General Education in a Free Society*. The report is of the greatest significance for the future of secondary and college education in the United States, since it deals not only with issues affecting the college curriculum at Harvard but also with the pressing problems of education facing the United States in the postwar years. The committee discussed the meaning and importance of equality of opportunity, the relationship between specialistic education adapted to diversity of gifts and general education in a common heritage and toward a common citizenship, the importance of better preparation and improved status for teachers, and the reconciliation of the cultural heritage and the spirit of change. For the high schools the committee recommended that from 50% to 75% of the students' time be devoted to a program consisting of humanities, social studies, science and mathematics as the areas of general education. The program recommended for Harvard undergraduates was intended to limit the elective principle and to require all students to select a minimum of 6 of the 16 courses for the bachelor's degree in general education. The committee also recommended that the tutorial system be retained but limited to perhaps half the students in the junior and senior years and a smaller number in the sophomore year.

The committee's proposals were considered by the Harvard faculty in October.

At Yale university, New Haven, Conn., the committee, which had been studying the reform of the curriculum from 1940, recommended in its report a drastic restriction in the elective system and proposed three main plans: (1) The standard plan for the great bulk (perhaps 85%) of the undergraduates to include three basic requirements (English, systematic thinking and modern languages) and six distributional requirements (inorganic and organic sciences, the ancient world, studies of society, literature and the arts, and courses in integration) to give the student a broad view of the world in which he lives and to equip him with the means of understanding it. At the end of the sophomore year each student will elect a subject or field for his major work in the last two years. During the summer vacations reading of prescribed books or books related to the student's major will be required. The standard program was to go into effect in Sept. 1946. (2) The scholars of the house program is an honours plan dealing with juniors and seniors only and beginning after the standard program has been in force for two years. This plan, open only to selected students at the end of their first two years, will permit complete freedom to follow any reasonable combination of courses. (3) An experimental program, to be elected by students at the beginning of the freshman year, is to be an experiment in controlled and integrated education with completely required courses in the first two years and selection of one of five major fields in the last two years. Properly qualified students may pass from one program to another, especially at the end of their sophomore year.

Another committee appointed by President Charles Seymour of Yale university recommended that the role of religion in higher education be re-evaluated to offset the prevalent aimlessness and lack of purpose and to develop students as responsible bearers of spiritual values.

**International Studies.**—One of the important contributions of an educational experiment during the war was expected to be a broader approach to the study of foreign languages with emphasis on "area studies" or the culture and civilization of the people whose language is being studied. The methods of language teaching developed in the army specialized training programs must, however, be adapted to normal conditions in schools and colleges. Columbia university announced the creation of a Russian institute to be followed later by five other institutes dealing with the British commonwealth of nations, east Asia, Latin America, France and Germany. The formation of a school of international affairs was also announced at Columbia university to train graduate students for service in government service and in international agencies, as well as for foreign trade, international law and international cultural and civic agencies. At the University of Virginia, Charlottesville, Va., a school of foreign service and international affairs was created to train for foreign service in and out of government and to provide for the study of international affairs as the basis of a liberal education. Similar training is provided in the school of public and international affairs at Princeton university, Princeton, N.J., and in the Institute of International Studies at Yale university. Courses in international affairs and relations have been introduced in other universities, as, for example, the University of Illinois, Urbana, Ill., the University of Pittsburgh, Pittsburgh, Pa., and Stanford university; near Palo Alto, Calif. Latin-American studies have been provided in schools and colleges throughout the United States. At Stanford university courses in Chinese studies have been organized with Chinese cultural scholarships provided by the national government of China. The introduction of courses in far eastern studies (China, India, Japan and other oriental countries) in schools, teacher-training institutions,

colleges and universities was urged in an article in *Education for Victory*, Feb. 20, 1945, the organ of the United States office of education.

**Postwar Scientific Research.**—On Nov. 17, 1944, President Roosevelt requested Dr. Vannevar Bush, director of the Office of Scientific Research and Development, to submit recommendations: (1) on making known the contributions made during the war to scientific knowledge; (2) on continuing the work done in medicine and related fields; (3) on what the government can do to aid research activities by public and private organizations; (4) on discovering and developing scientific talent in U.S. youth to maintain the level of scientific research achieved during the war. In July 1945, Dr. Bush presented the recommendations in a report *Science, The Endless Frontier, Report to the President on a Program for Postwar Scientific Research*, based on the deliberations of committees on each of the topics listed. Basing his recommendations on the view that "new impetus must be given to scientific research in this country" Dr. Bush stated that, while private sources should continue to support research, the impetus could best be provided by government aid. The report recommended federal support for basic research and scientific education beginning with a grant of about \$33,000,000 a year and rising gradually thereafter to \$122,000,000 a year. A national policy for scientific research and education should be promoted by a national research foundation to be created by congress and to comprise five divisions: medical research, natural sciences, national defense, scientific personnel and education, and publications and scientific collaboration. Scientific research was declared to be of importance for improving the welfare of the U.S. people, since "scientific progress is one essential key to our security as a nation, to our better health, to more jobs, to a higher standard of living, and to our cultural progress." Shortly after the publication of the report a bill was introduced in the senate to create a National Science foundation to carry out the purposes suggested in the report. The recommendations of the report did not, however, escape criticisms, some from those who feared federal control of research in general, others from scientists who expressed some scepticism about directed research and the acceleration of scientific discoveries through teamwork; these felt that a distinction must be made between pure and applied science.

**Education of Veterans.**—Plans were being developed during 1945 for the education of returning veterans in colleges and vocational schools and special arrangements were made for counselling them. Many veterans began to take advantage of educational opportunities provided in the G.I. Bill of Rights. There was some uncertainty, however, both about the numbers who would ultimately continue their education and about the types of courses they would select. Proposals were made to amend the legislation and to increase the benefits provided in the original act.

In the European area provision was made for the education of members of the armed forces in the interval before their return home. Three universities, staffed by American teachers and others, were opened in Florence, Italy, Biarritz, France, and Shrivensham, England; a centralized vocational school was established at Warton, England, and in addition about 2,000 schools were provided in the various army units.

**Compulsory Military Training.**—Considerable debate was aroused by proposals, supported by President Truman, some cabinet members, General George C. Marshall and the American Legion, to enact a system of compulsory military training in the postwar period for youth over 18. The Association of American Colleges, meeting at Atlantic City, voted 210 to 35 against compulsory military training. In a poll conducted by the National Education association some 60% of the 3,800 superintendents,

principals and teachers polled were opposed to the idea, and in a poll conducted by the American Council on Education three-fourths of the college and university presidents voted in favour of postponing action and urged the creation by congress of a commission to study national defense, including universal military training. Further study of the whole issue was also advocated in an article by Hanson W. Baldwin ("Conscription for Peacetime?" in *Harper's Magazine*, March 1945) which attracted widespread attention. A small number of university presidents and the Citizens Committee for Military Training of Young Men, Inc., formed in 1945, campaigned actively in favour of immediate legislation. Early in September, however, President Truman in his message to congress included universal military training among the measures to be enacted.

**Correspondence Schools.**—The war years stimulated a new interest in the provision of education by correspondence not only for members of the armed forces but also for high school students. Introduced in 1873, education by correspondence spread rapidly and was provided in 1945: (1) by private organizations; (2) by extension divisions of colleges and universities providing courses for high school students; and (3) by extension divisions of state departments of education. Of the first type there were nearly 400 reaching about 1,000,000 students of all ages; the best known of the private organizations is the International Correspondence schools, Scranton, Pa. Of the second type 35 colleges and universities in 1942-43 offered supervised courses for high school students, usually in vocational fields in which regular classwork was not provided. The University of Nebraska, Lincoln, Neb., one of the leaders in the movement, organized correspondence courses in 285 high schools for 3,100 students in 1942-43; similar courses are offered in Colorado, Montana, Wisconsin, North Dakota, Ohio and a number of other states. The departments of education in Massachusetts, Montana and Pennsylvania publish manuals for correspondence education, while other states sponsor or co-operate in making correspondence courses available. In Wisconsin local school boards are authorized by law to contract and pay for such instruction out of public funds.

The most extensive development of education by correspondence took place during the war, when the program of education for members of the armed forces at home and abroad was organized in 1942. The program is administered by the U.S. Armed Forces Institute (U.S.A.F.I.) at the University of Wisconsin, Madison, Wis. Those who registered for the correspondence courses paid \$2 per course and received instruction and textbooks from the institute, which co-operated in 1945 with more than 80 colleges and universities. The courses offered were on the high school and college level and credit was obtained for them. More than 20,000,000 copies of texts were distributed; 230 texts were published of which about 80 were self-teaching and the rest reprints of standard texts. The work of the institute was being further expanded to meet the needs of troops in occupation areas for vocational, technical and professional education.

A movement to provide supervised correspondence courses for veterans was launched by the board of education of Benton Harbor, Mich., a pioneer in the provision of such courses for high school students. The movement promised to spread to other public school systems. (See Department of Supervision and Curriculum Development, N.E.A., *Education in the Armed Services*, 1944; U.S. office of education, *Correspondence Study in High School Wartime Programs*, 1943.)

**Education and the United Nations.**—Active steps were taken to ensure that specific reference be made to education in the United Nations charter. The campaign was successful and provision for United Nations co-operation in educational and cultural matters was included in the charter wherever references were made to economic, social and humanitarian affairs. A conference, held in London from Nov. 1 to 16 and attended by delegates and advisers from 44 nations, resulted in the adoption of a constitution of the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.). The constitution would come into force when it had been accepted by 20 of its signatories. Paris was selected as the seat of the organization.

**Academic Freedom.**—The dismissal of Dr. Homer P. Rainey from the presidency of the University of Texas, Austin, Tex., continued to be discussed. The Southern Association of Colleges and Secondary Schools placed the university on probation, while the American Association of University Professors in an interim report criticized the regents of the university for "a serious disregard of good academic practice" and demanded the reinstatement of Dr. Rainey.

**Educational Developments Abroad.**—The postwar reconstruction of education in European countries proceeded very slowly during 1945. In both the liberated and occupied countries many school buildings were destroyed, some were left unfit for use, equipment and school materials were lacking and above all there was a serious shortage of teachers. The story of "Education under Enemy Occupation" (in Belgium, China, Czechoslovakia, Greece, Luxembourg, Netherlands, Norway and Poland) was told in *Bulletin* 1945, No. 3, of the U.S. office of education (1945). The same conditions existed, but not to the same degree as on the continent, in England and in Scotland and prevented the implementation of the reforms of the Education acts passed in England in 1944 and in Scotland in 1945. The Conference of Allied Ministers of Education, organized in 1942, appointed a commission in 1945 to survey the educational needs of the liberated countries and to exchange information on plans for meeting these needs. In France the report of a Commission on the Postwar Reform of Education, prepared while the government was in Algiers and published in the *Bulletin du Ministère d'Éducation Nationale* in November 1944, furnished the basis for discussion, but the enactment of the proposed reform waited until after the constituent assembly had drafted its proposal for the reorganization of the political structure of France. In

Germany General Eisenhower announced at the end of 1944 that all specifically nazi institutions would be permanently closed and in the educational system the elementary schools would be the first to be opened, to be followed in time by the opening of secondary schools and universities; all nazi doctrine, the race theory and militaristic indoctrination to be eliminated. (For statistics of institutions see UNIVERSITIES AND COLLEGES.) (I. L. K.)

**Great Britain.**—Planning and preparation were the keynote of 1945. The cessation of hostilities brought little or no improvement of conditions in the schools and universities; if anything, the shortage of manpower and materials became more acute.

In England and Wales the bulk of the Education act, 1944, came into operation on April 1, 1945. The reorganized system of local administration began to function, all postprimary schools became officially secondary, and tuition fees ceased in secondary schools maintained by local education authorities. The same day new salary scales for teachers, with a basic minimum of £300 a year for qualified teachers, became operative.

In April the ministry of education was reorganized to meet the requirements of the new act, and from then on until the autumn a stream of regulations made by the minister under the act was issued. These, with the ministry's directive and advisory circulars and memoranda, enabled the local education authorities to get to grips with their "development plans" (due under the act for presentation by April 1, 1946) for the reorganization of primary and secondary education and to draw up their schemes of local administration.

The breakup of the coalition government ended R. A. Butler's term of office as minister of education. He had held this post for nearly four years (from July 1941), and by his creation and pilotage through parliament of the Education act, 1944, he had established a reputation for statesmanship equalled by few if any of his predecessors. His successor, the Conservative Richard Law, held office only until August, when the Labour party came into power and Ellen Wilkinson became the first woman minister of education.

In September the minister of education announced that the raising of the age of compulsory attendance at school from 14 to 15 years would be deferred until April 1, 1947, the latest date allowed by the act, but not later, though sufficient teachers and accommodation to meet minimum requirements could hardly be provided before mid-1948. To expedite the provision of accommodation the ministry of works would supply and erect for local education authorities prefabricated huts.

In September also, Miss Wilkinson announced that compulsory part-time education for young people would begin on a national basis in 1950, and appealed to industrialists to establish, in co-operation with local education authorities, interim voluntary schemes. In October the ministry of education published *Youth's Opportunity*, a valuable pamphlet of guidance on part-time education in county colleges.

In March the minister's central advisory council for education in England announced that it had begun an inquiry into the value of existing education in schools "as a preparation for a useful and satisfying life." During the year negotiations were begun to transform the Foundation for Educational Research, which had been functioning under the aegis of the University of London, into a national body. This change was to take place at the end of the year.

In February the Education (Scotland) bill was reintroduced into parliament. The controversial nature of the clauses dealing with local administration threatened delay, but when it became apparent that the Churchill government was nearing its end these were dropped, the bill was rushed through and made law on June 15. It came into operation on July 2, making the provision of public education in Scotland comparable with that in England and Wales. Revised salary scales for teachers in Scotland were made effective from April 1.

In February Sir John Anderson, then chancellor of the exchequer, announced that on the recommendation of the university grants committee the government had decided to increase the treasury grant to the British universities (previously £2,249,000 a year) by £2,000,000 a year for general university purposes, £1,000,000 for the medical schools and £500,000 for the teaching hospitals; the position to be reviewed after two years. A token grant of £250,000 for capital expenditure was also made. In May the government announced that the arts courses for men at the universities would be reopened in October to admit about 600 students from secondary schools, and in August that 3,000 arts and 1,500 theological students would be released from British forces to take up or resume university studies. Military requirements somewhat hindered the release of forces students, and the universities began their first peacetime term at about two-thirds prewar strength, including a number of U.S. servicemen.

In November was published the report of the committee appointed in 1944, under the chairmanship of Lord Eustace Percy, to consider the needs of higher technological education in England and Wales and the respective contribution to be made by universities and technical colleges. This recommended the establishment of a national council of technology and regional advisory councils to co-ordinate higher technological studies, and the selection of a few technical colleges in which should be developed courses of comparable standard with university degree courses.

After the end of the war the comprehensive scheme of general and prevocational education for men and women in British forces awaiting demobilization was begun, and by October had got well under way. The forces' educational work stimulated much discussion as to how to carry this over into civilian life, and projects for community centres and associations and for resident colleges for adult education were developed in many places. In October the Arts Council for Great Britain (formerly the Council for the Encouragement of Music and the Arts) announced plans for art centres throughout Great Britain. On Nov. 16 the conference endorsed the constitution of the United Nations Educational, Scientific and Cultural organization and approved the instrument establishing a preparatory commission. The latter immediately began work under the chairmanship of Ellen Wilkinson.

## Edwards, Gus

(1881–1945), U.S. song writer, actor and producer, was born Gustave Edward Simon, Aug. 18. Shortly after he reached the United States with his family, he went to work as a tobacco stripper. He sang at a Brooklyn saloon and was spotted by a showman who introduced him to vaudeville audiences. He met a lyric writer, Will Cobb, and the two teamed their efforts in writing "I Can't Tell Why I Love You" and "When the Roses Bloom Again Beside the River." Both tunes were popular and earned the writers handsome royalties. Edwards then went into the song publishing business for himself. In addition, he produced a number of stage plays. Meanwhile, his songs were squeaking incessantly from phonographs all over the U.S., and included such hits as "By the Light of the Silvery Moon," "Good-bye Little Girl, Good-bye," "Tammany," "School-days," "Wonderful," "Every Day Is Mother's Day for Me," "Orange Blossom Time," "I'm Gonna Meet Minnie Tonight," "In My Merry Oldsmobile," "Don't Cry Little Girl Don't Cry," "Way Down Yonder in the Cornfield," "I Just Can't Make My Eyes Behave," etc. He appeared in the motion pictures *The Doll Shop* and *The Song Writers Revue* in 1929 and a film based on his own life, *The Star Maker*, was produced in 1940. He died in Los Angeles, Calif., Nov. 7.

## Eggs.

Total production of eggs in the United States in 1945 was slightly below the record of 1944. The total in 1945 was 5,050,000,000 doz. as estimated by the U.S. department of agriculture compared with 5,305,000,000 doz. in 1944 and a prewar average of 3,335,000,000 doz. in 1935–39. The decline in egg production reflected the reduction in numbers of poultry on farms in 1944 which was indicated by the large slaughter of poultry for meat in 1944–45. The number of laying hens was increased late in 1945 indicating larger production of eggs in 1945–46. Egg production had increased each year from 1940 to the record in 1944 when the first signs of declining demand appeared. Stocks were high and domestic consumption higher than ever before, 351 eggs per capita.

The farm prices of eggs ranged higher through 1945 than in previous years and much above the prewar average. The average farm price ranged from 41 cents per dozen in January down to the seasonal low of 33 cents per dozen in April and up to 40 cents per dozen in August. Following the end of World War II the price declined again. The stocks of shell eggs were much below normal during the spring of 1945 and on July 1 were the lowest on record and 46% below 1944. Frozen eggs were in good supply above averages. Dried egg stocks were much lower than in 1944. With the decline of military and lend-lease demand for dried eggs this form of processing began to decline since the civilian uses for dried eggs did not increase as rapidly as expected. Such eggs are used principally by bakers and other food manufacturers rather than by housewives. A considerable export demand was expected to continue for some time for relief purposes. The growth of dried egg processing was one of the striking developments of World War II. From a total output of 7,487,000 lb. of dried eggs in 1940 the production increased to 320,742,000 lb. in 1944. It then dropped to about 100,000,000 lb. in 1945.

The domestic demand for eggs was maintained somewhat in 1945 by the shortage of meats. Per capita consumption of eggs reached a new high record of about 390 eggs per capita in 1945 compared with 351 in 1944, 316 in 1940 and a prewar average

EGGS ready for export from Denmark in the summer of 1945. After V-E day the country was able to resume export of butter, bacon and eggs, but in smaller quantities than before the war

of 298 in 1935-39. The increase in the raising of chickens for meat accounted for the use of about 200,000,000 doz. eggs for hatching and appeared to be likely to continue. Exports of eggs, mostly in the form of dried eggs, averaged about 550,000,000 doz. annually during the war years or more than 10% of the total supply. Most of these were shipped under lend-lease. A continued export outlet depended upon the extent of relief shipments. The military procurements which amounted to almost 500,000,000 doz. in 1944 and 1945 began to decline sharply in late 1945. The total production of eggs at around 430 per capita attained during 1943-45 was not expected to continue without a sharp reduction in prices. Under the Stabilization act egg prices were to be supported at not less than 90% of parity for two years after Jan. 1, 1946, following the official end of hostilities. Farm prices averaged above 90% of parity through 1942 to 1945.

The egg production of the United States is centred in the north central states with Iowa leading and Minnesota a close second. The 12 central states produce nearly half of the total of the country. The south central states follow with north Atlantic states third in order. Texas alone is a large producer in the south. The commercial egg plants, however, are concentrated on the Atlantic and Pacific coasts, but account for only about 10% of the total output compared with farm poultry. (See also POULTRY.)

**Egypt.** An independent kingdom of northeast Africa; bounded N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, N.E. by Palestine, E. by the Red sea, W. by Libya and the Sahara. Area c. 383,000 sq.mi. (arable land 13,600 sq.mi.); pop. (est. June 1943), 17,423,000. Chief towns (pop. 1937): Cairo (cap. 1,312,096); Alexandria (685,736); Port Said (124,749); Tanta (95,260); Mansura (69,036); Da-

manhur (61,962); Asyut (60,338). Ruler, King Farouk I; premier, Mahmoud Fahmy el-Nokrashy Pasha (Feb. 24, 1945); language, Arabic; religion, Mohammedan 91%; Copt 7%.

**History.**—A general election was held on Jan. 8, 1945. The opposition (the Wafd), following the precedent of opposition parties in former years, boycotted the election. There was a record number of voters and the results were: Saadists, 124; Liberals, 74; Makramists, 30; Independents, 29; Nationalists, 7. In compliance with King Farouk's wish, a coalition cabinet was formed by the Saadist prime minister, Ahmed Maher Pasha. There were demonstrations and strikes in Cairo from Feb. 6-9, but the Wafd denied the government's allegations that "opposition parties" were behind the disturbances.

Egypt was the setting for what were probably the most important conversations ever held on the future of the middle east when President Roosevelt and Prime Minister Churchill, on their way home from the Crimea conference, had discussions with King Farouk, King Ibn-Sa'ud and the emperor of Ethiopia. Roosevelt, on board a U.S. destroyer in the Great Bitter lake near Suez, on Feb. 13 and 14 received in turn King Farouk, the emperor of Ethiopia and King Ibn-Sa'ud. The destroyer then sailed for Alexandria harbour, where the president and Churchill held their last conference. Churchill proceeded to Cairo where on Feb. 16 he conferred with the emperor of Ethiopia; on the morning of Feb. 17 he had a discussion with King Ibn-Sa'ud and in the afternoon met the king of Egypt. He subsequently saw also the president of the Syrian republic. Apart from an announcement from the White House on Feb. 20, which stated that the future of U.S.-Egyptian trade was stressed in the conversations between the president and King Farouk, official statements gave little information about the subjects discussed at these meetings between the leaders of the middle east and western powers. It is significant that the meetings took place at the same time as the conference of Arab foreign ministers to draw up a constitution for a league of Arab states, which was held in Cairo, Feb. 14 to March 3.

The Egyptian prime minister, Ahmed Maher Pasha, was assassinated in parliament on Feb. 24 after reading a royal decree declaring war on Germany and Japan. The assassin, an extremist young lawyer with pro-nazi sympathies, was immediately arrested and subsequently executed. Mahmoud Fahmy el-Nokrashy Pasha, Saadist foreign minister, became premier, the cabinet otherwise remaining unchanged, and the premier's powers were extended by royal decree. On Feb. 26 parliament approved a state of "defensive war" against Germany and Japan by 214 votes to 2 in the chamber of deputies and 66 to 41 in the senate. Egypt was not qualified to take part in the San Francisco conference.

The end of the war in Europe brought a relaxation of press censorship and with this a flaring up of the old political warfare. An increased national consciousness had made inevitable the demand for the revision of the Anglo-Egyptian treaty of 1936, particularly as the military dangers which helped to shape Anglo-Egyptian relations from 1936 onward had, in the eyes of Egyptians at any rate, ceased to exist. The government showed considerable moderation, however, and refused to be dragooned by extremists into countenancing street demonstrations and the old methods of political warfare to force the issue with the British government. Cairo students, who had in the past shown themselves to be willing agitators, seemed to be reluctant to embarrass the government. By October it was clear that the Egyptian government was anxious for early revision of the treaty and for the immediate evacuation of British troops, but that at the same time it wished to maintain and develop friendship with Great Britain.

The government also made an effort to improve the state of home affairs and in the autumn considered proposals for a five-year plan to improve the country's social and educational services and internal transportation.

The state of siege, which had been declared early in World War II and approved by parliament on Oct. 12, 1939, was lifted on Oct. 8, 1945. (J. R.A.)

In his speech from the throne on Nov. 12, King Farouk announced far-reaching economic reforms: these included the distribution of 500,000 ac. of land to small cultivators, the raising of excess profits duty to 50%, and the introduction of income tax on a sliding scale, by which means the rich would aid the poor. The import permit system on all goods from the sterling area was to be abolished.

Demonstrations against the Balfour declaration on Palestine led to widespread rioting in Cairo and Alexandria on Nov. 2 and 3.

**Education.**—(1938–39) Elementary and secondary schools 4,065; scholars 1,064,209; colleges 8; scholars 1,980; Fuad I university: scholars, male 8,393; female 7,043; foreign schools (1936–37) 410; scholars 76,750.

**Banking and Finance.**—Revenue (est. 1945–46) \$349,661,000; expenditure (est. 1945–46) \$359,178,400; public debt (Oct. 31, 1944) \$380,696,000; notes in circulation (Aug. 1944) \$416,696,600; gold reserve (Aug. 1944) \$25,655,600; foreign assets reserve \$414,213,800; exchange rate (£Ei = 100 piastres): (1944) £Ei = 413.8 cents U.S.

**Trade and Communication.**—External trade (merchandise): imports (1943) \$156,002,600; exports \$103,350,000. Communications and transport (1938): roads, main 1,240 mi.; secondary 3,430 mi.; railways (1941), state 3,686 mi.; agricultural 862 mi.; shipping (1939) 110,000 tons gross; entered ports 35,390,325 tons gross; passed through Suez canal 25,827,977 tons gross; motor vehicles licensed (Dec. 31, 1938): cars 29,382; commercial 4,074; cycles 2,051; wireless receiving set licences (Dec. 31, 1938) 76,823; telephone instruments in use (April 30, 1938) 59,922.

**Agriculture and Minerals.**—Production (1943) (in short tons): cotton, ginned 176,500; maize 1,514,700; wheat 1,402,900; rice 745,250; petroleum 1,413,500; barley 345,850; groundnuts 18,480. (See also ANGLO-EGYPTIAN SUDAN.)

**Eichelberger, Robert Lawrence** (1886– ), U.S. army officer, was born March 9 in Urbana, Ohio. A graduate of West Point, he was commissioned a 2nd lieutenant in 1909, saw service on the Mexican border and the Panama Canal Zone and in 1918 was awarded the D.S.C. and D.S.M. while serving with the army of occupation in eastern Siberia. After World War I, he was stationed in the orient. On returning to the United States, Eichelberger was attached to the general staff for several years in the early 1920s. In 1940, he was reassigned to West Point, where he streamlined the entire curriculum of training. Made a brigadier general in 1940, Eichelberger was promoted to the rank of major general in July 1941 and to lieutenant general in Oct. 1942. In Jan. 1943, Gen. Douglas MacArthur revealed that Eichelberger had been placed in command of U.S. troops in Papua. In 1944, as field commander in Netherlands New Guinea,

he took part in the invasion of that territory in April, landing with U.S. troops at Tanahmura bay.

In 1945, as head of the U.S. 8th army, he commanded the U.S. forces that established beachheads at Zambales province on Luzon (Jan. 29). Eichelberger commanded 8th army occupation troops that landed in the environs of Yokohama and Tateyama, Sept. 2.

**Eire.** Eire is the southern portion of an island to the west of Great Britain, extending from 51° 26' to 55° 21' N. and from 5° 25' to 10° 30' W. Under the constitution, operative from Dec. 29, 1937, the name "Irish Free State" was replaced by that of "Eire," or Ireland. President: Seán T. O'Kelly (Ó Ceallaigh). National flag: the tricolour of green, white and orange.

Area 26,601 sq.mi.; pop. (est. June 30, 1944) 2,938,000. Chief towns (pop. register 1943): Dublin (cap. 495,074); Cork (75,484); Limerick (42,070); Dun Laoghaire (42,105); Waterford (27,825). Languages: Irish and English; religion: Christian (Roman Catholic 93%).

**History.**—It was hoped that on retirement from the presidency of Dr. Douglas Hyde after seven years of office (1938–45) an agreed successor might be found. Three candidates, however, were nominated, and polling took place on June 14, 1945, after a vigorous campaign. Seán T. O'Kelly, Tánaistè (deputy prime minister), and minister for finance, received 537,965 votes; General Seán McKeon, an opposition leader, 335,539; and Dr. Patrick McCartan, an Independent, 212,791. On McCartan's elimination O'Kelly was elected with 565,165 votes to McKeon's 453,425. Seán Lemass, minister of industry and commerce, took O'Kelly's place as Tánaistè, and Frank Aiken, formerly minister for co-ordination of defensive measures, as minister for finance.

In the elections for local councils held on the same day as that for the president, Fianna Fáil secured 280 seats and other parties 356.

Principal legislation of the year was the Emergency Powers (Continuation and Amendment) bill, passed on July 5. This repealed postal censorship and power to detain and try civilians before military courts. It was found necessary simultaneously to enforce the Offenses Against the State act of 1940 in order to

"A VERY QUIET FUNERAL." Jim Berryman of the *Washington Evening Star* doubtless had in mind Pres. de Valera's condolence call on the German embassy following reports of Hitler's death on May 2, 1945

cope with Irish Republican army activities. On Dec. 1, 1944, a reprieve was refused to C. Kerins, sentenced to death for political murder of a detective.

On May 3, 1945, Eamon de Valera paid a condolence call on the German minister on Hitler's reported death. He later defended his action in the Dáil as normal diplomatic practice.

Churchill's broadcast on the end of the war (May 13) contained some references to Eire. De Valera made a conciliatory reply (May 18). Slight disturbances occurred in Dublin on May 7. Next day the German legation was handed over to the U.S. minister.

The status of Eire was debated in the Dáil from July 11-18. De Valera declared Eire to be a republic linked with the British commonwealth only by the External Relations act, 1936.

An air agreement with the U.S. was signed on Feb. 4, giving right of commercial entry at Shannon airport. The first transatlantic commercial land plane arrived at Rineanna on Sept. 16.

(M. T.)

**Education.**—Elementary schools (1943-44) 5,032; scholars 454,647; secondary schools (1943-44) 371; scholars 39,787; universities (1943-44), National (excluding St. Patrick's college, Maynooth) 4,538 students; Trinity college, Dublin, 1,400.

**Banking and Finance.**—Revenue, ordinary (1944-45) \$186,000,000; expenditure, ordinary (1944-45) \$196,000,000; revenue (est. 1945-46) \$193,000,000; expenditure (est. 1945-46) \$212,000,000; public debt (March 31, 1945) total, \$320,500,000; notes in circulation (June, 1945) \$148,300,000; reserve, gold (March 31, 1945) \$10,620,000; securities reserve (March 31, 1945) \$114,000,000; exchange rate (1945) £1=403.5 U.S. cents.

**Trade and Communication.**—Foreign trade (merchandise): imports (1944) \$113,600,000; exports (1944) \$118,700,000; re-exports (1944) \$475,000; roads, main (1943-44) 10,600 mi.; secondary, 38,300 mi.; railways, total track mileage (1944) 2,493 mi.; shipping (1943): vessels 476; net tonnage 45,184; motor vehicles licensed (Aug. 1944): private cars 6,566; other vehicles 20,916; wireless receiving set licences (1943-44) 173,300; telephones, installations (1943-44) 31,168.

**Agriculture, Manufacturing, Mineral Production.**—Production (1944) in short tons: oats 871,500; wheat 610,400; potatoes 3,360,800; barley 170,500; beet sugar 89,100; coal 226,600; wool 7,929. Livestock, number (June 1, 1944): cattle 4,245,936; sheep 2,663,062; pigs 380,824. Agriculture and fisheries, net output (1943-44) \$369,000,000. Number of insured workers (1943-44) 408,896; number of unemployed, average (1944) 60,310; (July 29, 1944) 45,953.

**Eisenhower, Dwight D.** (1890- ), U.S. army officer, was born Oct. 14 at Denison, Tex. He was admitted to West Point, graduating in 1915, and during World War I was an instructor at several U.S. army camps. After graduating from the Army War college, he served in the office of the chief of staff, Washington. In 1935, he served in the Philippines as Gen. MacArthur's chief of staff. In June 1942, he was given command of the U.S. headquarters in England and was promoted to the rank of lieutenant general. He commanded U.S. forces that landed in North Africa, Nov. 8, 1942, and on Feb. 6, 1943, he was made commander of all Allied forces in North Africa; five days later, he was made a full general. Under his leadership, Allied armies destroyed the axis armies in Tunisia, conquered Sicily and invaded Italy. These impressive victories led to his appointment as commander in chief of Allied invasion armies, announced Dec. 24, 1943. Eisenhower shifted his headquarters to England, and launched the invasion of France, June 6, 1944. By the end of the year his armies had retaken virtually all of France and Belgium and part of Holland, and had penetrated Germany. On Dec. 15, 1944,

Eisenhower was promoted to the newly established five-star rank of general of the army.

The Allies suffered a temporary setback in Dec. 1944 when the German counteroffensive in the Ardennes forest ripped a 60-mi. hole in the Allied line. His forces subsequently recemented the line, and Eisenhower then launched the grand offensive, Feb. 23, 1945, that collapsed the wehrmacht by May 7. Eisenhower, who had been designated chief U.S. representative in the Allied military government for the rule of Germany (March 29), moved his headquarters to Frankfurt-on-Main (May 26). He journeyed to Moscow (Aug. 11) where he was feted and received by Premier Stalin. In September, criticism of U.S. laxity in enforcing the de-nazification program led Eisenhower to order an intensification of the program toward that end. Eisenhower, who favoured a unified command for the armed services, was named chief of staff of the U.S. army, succeeding Gen. George C. Marshall, Nov. 20.

**Elections.** Although off-year elections in the United States in 1945 were scattered and confined principally to local battlegrounds, national political observers thought that they detected several significant trends which might affect future alignments or realignments in larger fields. They scanned every result, no matter how seemingly trivial, for the light it might throw on the presidential sweepstakes in 1948.

Their tentative conclusions from the 1945 demonstrations of changing popular sentiment were:

(1) There had been a slight defection from the Democratic party as represented by the Truman administration. They considered this to be a normal reaction to a political regime which had held power for so long, to the end of patriotic and emergency pressures of World War II and to the disappearance of such a popular leader as Franklin Delano Roosevelt, whose death in April turned the reins of politics and government over to Harry S. Truman of Missouri.

(2) The voters were beginning to show less respect and loyalty for old-fashioned partisan and clubhouse affiliations. The late Roosevelt's gay spirit of organization irresponsibility, as well as the emergence of postwar problems which transcend party lines and formulae, was held largely responsible for this development.

(3) Organized labour, as embodied by the C.I.O.'s membership in mass and aggressive unions, became a new, vigorous and self-conscious factor in U.S. politics and public life which the major parties and politicians, including a president, could neglect only at their peril. It achieved a balance-of-power position in numerous populous, industrial centres where, as they did for Roosevelt in at least the 1940 and 1944 struggles, the majorities could determine the outcome in electorally strategic states, and, therefore, in the nation.

The November mayoralty elections in Detroit and New York city supported the politicians in these deductions. As great cosmopolitan and industrial centres, they served to supply some insight into the mental and emotional processes and reactions of the postwar voter.

In the automobile capital Mayor Edward J. Jeffries was re-elected after what he called a "nasty fight" for his fourth two-year term. He defeated Richard T. Frankenstein, the vice-president of the United Automobile Workers of America, in the C.I.O.'s first major attempt to elect a union official to such a high municipal office. Previously, the C.I.O. and other labour organizations were content to endorse, support and finance candidates whose labour views they approved, regardless of their partisan tieups.

Mayor Jeffries won by approximately 57,000 majority in a total vote of 501,047, the largest number of ballots ever cast in

a municipal election in that city. Although Detroit's local contests are supposed to be conducted on a nonpartisan basis, Republicans and conservatives united behind the mayor, while Democratic national chairman, Robert E. Hannegan and the Wayne county (Detroit) Democratic committee backed Frankenstein. The Political Action committee, the C.I.O.'s ballot-box auxiliary, contributed \$100,000 to their candidate's campaign chest.

It was generally believed that labour's candidate suffered because of a "white collar and middle-class revolt," which included many unorganized workers, tradesmen, small business men and even members of the U.A.W. For months before the election Detroit had been the scene of violent labour difficulties that jeopardized jobs and nation-wide reconversion, and Frankenstein apparently became the victim of popular resentment when he ran for office.

Some observers interpreted the outcome as a setback for organized labour's effort to exert a direct and controlling influence in U.S. politics. Noting the large turnout for Frankenstein in the face of obvious handicaps, however, other onlookers preferred to withhold judgement on the long-range significance of the result. They pointed out that a labour vote of 215,000, which the C.I.O. entry obtained, could easily become the deciding factor in state and national contests. There have been many major battles in Michigan and in other labour-conscious communities where the allegiances of 215,000 or even fewer voters determined the outcome.

Frankenstein himself gave no sign of dejection. "In and for itself," he said, "this election was not, perhaps, of great and lasting importance. But in a few years there will be many others which will resemble it in the sense that candidates coming out of the ranks of organized labour or receiving the support of organized labour will be standing for office. Progressive forces do not look upon the election results as a defeat. We have polled the largest vote ever given a Progressive candidate, even a winning candidate."

New York city had a scrambled affair in the mayoralty struggle, but its pattern resembled Detroit's in some respects. Moreover, more national issues and personalities were present than in Detroit's trial at the polls.

The Democrats, who closed ranks so as to include New Dealers and Tammany Hall's hierarchy, recaptured city hall after 12 years of exile. They named William F. O'Dwyer, erstwhile Brooklyn policeman and famed prosecutor of Murder Syndicate Inc., as their candidate. Largely at the behest of Governor Thomas E. Dewey, the Republicans selected Judge Jonah Goldstein, a former Democrat. In personal protest against both the regular slates, which he denounced as "reactionary," Fiorello H. La Guardia, the retiring mayor, entered Newbold Morris, a brilliant, civic minded member of the La Guardia cabinet.

It was a walkaway for the Tammany-New Deal office seeker. O'Dwyer polled a total of 1,119,225 votes as against 434,050 for Judge Goldstein and 399,437 for Morris. It was the largest plurality a Democratic candidate had ever achieved. The Republican vote was the smallest after 1917. It was estimated that at least 100,000 Republicans voted for the La Guardia protest entry.

Nevertheless, the O'Dwyer sweep caused some chagrin among his Tammany Hall backers. Of about 2,000,000 votes cast, he received only 840,000 under the Democratic emblem, or only a few thousand more than the combined Goldstein-Morris total. He owed his unprecedented over-all lead to 259,268 American Labor party ballots—another demonstration of labour's growing power at the polls.

Close analysis of the final figures suggested that Tammany Hall no longer rules the metropolitan roost, because of the

growth of more independent and intelligent thought among the electorate.

The Morris "No Deal" ticket's performance likewise testified to a more enlightened public attitude. His surprising showing, which was achieved without organization or financial backing of any substance, was attributed chiefly to popular appreciation of Mayor La Guardia's excellent, public-spirited, 12-year administration. Even hostile newspapers conceded that the "Little Flower" had given New York the best administration in its chequered history.

Mayor La Guardia interpreted the vote as a sentence of death on machine politics and control. Hailing the Morris demonstration as a mandate for "good government," he promised his support to mayor-elect O'Dwyer "so long as he keeps straight, and keeps aloof, apart and away from political bosses and party machines."

President Truman and the administration's record played only a minor role in the campaign. He let it be known in diverse ways that he endorsed O'Dwyer's candidacy, but he made no speeches and issued no formal statements. When the chief executive reviewed the U.S. fleet in New York harbour a few weeks before the election, he had O'Dwyer as a breakfast guest aboard the presidential train. The president gave out no public endorsement, but O'Dwyer told the press after his talk with Truman that the latter had expressed hope and confidence that the Democratic ticket would win.

The Tammany nominee's principal vocal support came from Roosevelt New Dealers, including Mrs. Eleanor Roosevelt, Secretary of Commerce Henry A. Wallace and Henry Morgenthau, Jr., former secretary of the treasury. Democratic national chairman Hannegan took an active part, as did his predecessor in the national chairmanship and the post office—James A. Farley. The so-called "idealists" and the practical politicians buried their differences and rallied around O'Dwyer.

Governor Dewey's enemies seized on Judge Goldstein's miserable showing to proclaim that it marked the political death of the G.O.P.'s 1944 presidential nominee. He was held to have been instrumental in forcing the jurist's nomination, and thus the latter's small Republican vote was interpreted as a rebuke to the governor and as evidence that he had lost popularity even with Republican voters.

Although the two major parties broke about even in the mayoralty contests in other large cities, the Republicans had a slight edge. In several centres where the Democrats retained control, their previous majorities were reduced sharply. In several cities, notably Pittsburgh, Pa., they were kept in office only with the reinforcement of organized labour.

The G.O.P. scored possibly significant triumphs in the mayoralty elections in Buffalo, N.Y., and in Hartford and New Haven, Conn., three populous, industrial and prophetic voting laboratories. In Buffalo and New Haven they terminated two Democratic reigns which were established almost simultaneously with the late President Roosevelt's appearance on the national political stage—a 12-year-old Democratic rule in New Haven and one of 14 years in Buffalo. In Hartford the Republicans re-elected a mayor who, two years before, had won back the municipal government after ten years of Democratic control.

The mayoralty results in these three key cities, as well as in Detroit, cheered the G.O.P. strategists. In their opinion, the balloting in these places was a hopeful prophecy for the 1948 presidential contest. Their task then would be to hold down or wipe out Democratic majorities in the large industrial centres and to retain their demonstrated supremacy in rural areas—a combination which might lead the minority to the White House and control of congress.

Like the New York and Detroit results, the outcome in

Bridgeport, Conn., reflected a breakup in old-line ties and some instability in voting instincts. Jasper McLevy, Socialist, was re-elected for his seventh two-year term. Campaigning only on the issue of "honest, efficient and economical government," the house-roofer rolled up a majority of 9,690 over his two rivals and a plurality of 15,195 over his Democratic opponent.

The Republicans carried all three special congressional elections which were held after President Truman entered the White House. They put their best foot forward in the 2nd Montana district, where a house vacancy was filled on June 5. The G.O.P. nominee won by 4,032 votes, although the deceased Democratic candidate had been victorious in the regular 1944 contest by 9,751 votes.

The only off-year congressional election in the east was staged on Nov. 6 in the 4th New Jersey district. In a three-cornered battle the Republican held the seat by a substantial majority. His victory was expected, since this district had been Republican for many years. The voting was light, although the C.I.O., which put up an independent candidate against both Democrats and Republicans, tried to promote a heavy turnout in this industrial area.

In the 24th Illinois district the Democrats did not even name a candidate. The Republicans won by default.

Herbert E. Brownell, Republican national chairman, derived satisfaction, so he said, from the Montana and New Jersey results because in each instance the Democratic standard-bearers ran on a platform of "Support Truman." Commenting on the general outcome of the 1945 off-year tests in congressional and municipal elections, he said: "When the votes were counted, our party retained practically everything it had before and gained several strategic offices previously held by the Democrats." (See also SOCIALISM.) (R. Tu.)

**Electrical Industries.** Utility Operations. — Starting at a lower point at the opening of 1945 than in 1944, the curve of weekly outputs of electricity in the United States shot up in Jan. 1945 to 4,614,000,000 kw.hr., 75,000,000 higher than the corresponding week in 1944. Then it turned down and although for some weeks in April, May and June, it remained respectably above 1944, the trend was definitely downward, ending in the last week of the year 500,000,000 kw.hr. below 1944.

Despite the behaviour of the output curve, the production of energy in 1945 was not as much under the previous year as was generally expected would result from the ending of World War II, 222,000,000,000 kw.hr. as against 228,000,000,000 in 1944, only about 3%.

The year was a good water year. Hydrogeneration of energy increased from 74,000,000,000 in 1944 to 80,000,000,000 kw.hr. in 1945, 8%, while fuel power generation declined from 157,000,000,000 to 142,000,000,000, 9%, three times the percentage of decrease in total output for the year. In terms of average production per unit of capacity, hydrogeneration showed an increase from 5,109 kw.hr. per kw. in 1944 to 5,437 in 1945, while the corresponding figures for fuel power generation decreased from 4,526 to 4,023.

It was fortunate that water for hydrogeneration was plentiful in 1945, otherwise quite serious difficulties of fuel shortage might have occurred. The increase in hydroproduction of electricity saved about 4,000,000 tons of coal. This is not a large figure in comparison with national coal production nor very large in relation to coal consumption by electric utilities, but bearing in mind that national bituminous coal production dropped from about 620,000,000 tons in 1944 to around 575,000,000 in 1945 and that because of this decrease the government prohibited use of electricity for advertising and all other display lighting, the

saving of 4,000,000 tons of coal by plentiful rainfall became important.

Increase of 712,000 kw. in generating capacity in 1945 was the least of any in the war years, corroborating something that had been indicated by other data previously, the reaching of a plateau in war production. Expansion of production facilities, heretofore rapid, was definitely slowing up and the job was more and more becoming one of grinding out the goods of war. Then the war ended.

Predictions had been freely made that the war's end would find the electric utilities with a huge surplus of generating capacity. Proof that this idea was not shared by utility management appeared in announced plans for the addition of 1,462,311 kw. in new generating capacity in 1946. Of this amount about five-sixths was for power company systems, the remainder for federal and municipal power plants.

The addition to generating capacity takes about 35% of the projected expenditures for capital construction by the utilities in 1946. The total 1946 construction budget of utilities serving the public directly, exclusive of rural electric co-operative systems, was estimated at \$895,000,000. This budget was topped by that of only one other year in the history of the industry, \$919,000,000 in 1930, when the utilities in response to the direct request of the president of the United States went all out in a building program in an effort to stem the then beginning tide of business depression.

Previous reporting of generating capacity had arrived at a figure of 50,524,000 kw. for 1944. As of Nov. 1, 1945, capacity was given as 49,901,000 kw., which is at variance with the earlier statement in this article that 712,000 kw. had been added in 1945. The discrepancy is explained by the fact that during the year the Federal Power commission revised its classification of utility plants to take out certain mining and manufacturing and railway power plants previously included.

Sales of electricity declined from 198,000,000,000 kw.hr. in 1944 to 194,000,000,000 in 1945, a much smaller decrease than might have been expected following the end of the war and the consequent drop in industrial activity. Actually the reduction in sales to large industrial customers was comparatively small, from 115,000,000,000 kw.hr. to 108,000,000,000, or 7,000,000,000. Sales to residential, rural and commercial customers increased about 3,500,000,000 kw.hr., thereby cutting the reduction in total sales to 4,000,000,000.

Although total sales of energy dropped slightly from 1944, revenue showed a slight increase from \$3,277,000,000 in 1944 to \$3,334,000,000 in 1945. This increase was caused by differences in rate schedules. Because of very large usages per customer, industrial rates are lower than for customers in other classifications who buy energy in much smaller quantities. This difference caused the decline in revenue from large industrials to be more than cancelled out by increases in revenue from other classes. The increase in energy usage by residential customers brought their average annual consumption up to 1,225 kw.hr. and their average cost per kw.hr. down to 3.42 cents. Illustrating the effect of increased consumption on cost of electricity to the user is the fact that the average residential customer paid only 2 cents per kw.hr. for the additional energy he used in 1945. In 1944 he used 1,150 kw.hr. for which he paid \$40.40; in 1945 he used 1,225 kw.hr. for which he paid \$41.90. The additional 75 kw.hr. cost him \$1.50.

Upward trend in operating expenses continued through 1945. Operating ratio, expenses over revenue, rose from 41% in 1944 to 41.3% before payment of taxes. After taxes, the rise was from 63.6% to 64.2%. Ten years before, the proportion of revenue available for dividends and surplus was about 20%. That ratio was down to 15%, principally because of increase in taxes

which in the same period rose from 15% to 23%.

A significant condition is indicated in the 1945 data on electric utility customers. In the first two war years the number of commercial and small industrial customers decreased. That trend reversed in 1944 as war production spread out to include more of the smaller industrial plants and in 1945 it turned more sharply upward. At the end of the year the total of these customers was 2% more than just before the war. Thus an observable increase in small business enterprises in 1945 is indicated. Total number of customers kept on growing through the war years and at the end of 1945 stood at 33,900,000; of these, 29,220,000, about 86%, were residential and rural customers, home users of electricity.

**Regulation and Rates.**—Rate reductions were numerous during the year. About 60 utilities announced rate changes that effected revenue decreases of around \$18,000,000. In about 30 more cases reductions were announced without money estimates being given.

Friction between state and federal regulation of utilities persisted through 1945. The Arkansas Power and Light Co. asked a U.S. district court to decide between orders issued on it by the Federal Power commission and by the state public service commission. The Arkansas legislature endorsed action taken by the state service commission against FPC. The chairman of the New York commission charged the FPC with usurpation of authority in attempting to assert jurisdiction over several utilities in the state. In Maryland the state commission rejected FPC's theory of "original cost" in favour of determination of fair value in a rate case. The Montana commission attacked conduct of FPC in regard to a rate case of the Montana Power Co. Efforts of FPC to bring the Connecticut Light and Power Co. into its jurisdiction as an interstate utility were stopped by a supreme court decision.

**Public Power.**—Soon after taking office, President Truman announced he would continue the power policy of his predecessor, but he did not press the policy as hard as Roosevelt. Truman extolled the Tennessee Valley authority in a speech dedicating the last of the authority's main river plants, but he failed to state clearly the administration's policies on river control and development. A bill for nine regional authorities patterned after TVA was introduced in congress but made no headway. The proposal for a Missouri Valley authority which had been in congress for a year or more aroused considerably less than enthusiasm in senate committees. Novelties appeared in bills for a Columbia Valley authority which provided for a large measure of local control and for an Ohio Valley authority which contained no provision for power. Both the MVA and CVA proposals encountered opposition from local groups, "weary and wary," as one spokesman put it, of domination from Washington. Efforts to revive the St. Lawrence project foundered on the perennial question of treaty or no treaty with Canada. Indignant citizens of Maryland, Virginia and West Virginia forced abandonment of elaborate plans by the corps of engineers, U.S. army, for power dams on the Potomac river. Late in 1945 the deficiency appropriations bill was shorn of much power project money in the house. The senate restored some of the cuts, but compromise in conference left power appropriations much less than was desired by the government power interests.

**Electrical Manufacturing.**—Termination of contracts for war goods imposed no great problem of reconversion on manufacturers of electrical apparatus and materials. The war had simply imposed on them a much higher demand for goods of their regular production. The case of makers of electrical appliances was much different. Production of appliances was discontinued almost entirely during the war years as is shown by the index of manufacturers' sales of these goods which dropped from 212 in 1941 to a low of 12 in 1943 and reached 60 in 1945 in a slow struggle back. These manufacturers found conversion difficulties greater than had been anticipated; increased costs which bumped against ceiling prices and recalcitrant labour joining to prevent production from reaching expected levels.

The index of electrical manufacturing production dropped from 553 in 1944 to 430 in 1945, a greater decrease than was indicated by the contemporary drop in the Federal Reserve board production index from 258 to 231.

It was not likely, however, that the index of electrical goods production would continue downward for very long or very far. A tremendous backlog of demand for electrical apparatus and materials accumulated during the war years. Evidence of that demand was seen in the estimated expenditure of the electric utilities for new construction in 1946, earlier mentioned in this report. To the utility requirement must be added an even greater demand for electric facilities in reconverted and new industrial plants. Another factor to raise demand on makers of electrical goods was the intensive promotional activity well under way in the various sections of the National Electrical Manufacturers association. Programs on adequate wiring, farm electrification, street and highway lighting, rural and suburban market development, electric fans, ranges and water

ILLUMINATION of the Statue of Liberty, resumed after V-E day in 1945, was redesigned to approach daytime effects. Mercury vapour and incandescent floodlights accentuated the sculptured appearance and made the torch seem more fiery

heaters, and home freezers were a few already organized or in immediate prospect at the close of 1945.

**New Developments.**—Provision of the immense quantities of electrical equipment for production of the atomic bomb interfered greatly with the scheduling of utility requirements during the war years. This was the first impact of atomic fission on the utility industry although not known then for what it was. Then when the bombs dropped on Hiroshima and Nagasaki, atomic energy loomed up immediately as a possible power producer and had its to-be-expected extravagant day. A bill for an Atomic Power authority was offered in congress and the public was regaled with uninhibited prophecies of automobiles and aeroplanes running for ten years on half a pound of U-235 and available tomorrow or next week at the latest. More reasonable ideas soon prevailed as testimony of scientists showed that practicable utilization of atom splitting for power production was still quite distant in the future.

Less spectacular but more immediately useful technical advances were made during 1945. An important forward step in the prime mover art was made in the completion and testing of a 2,500-h.p. gas turbine designed for ship propulsion. This was important to the electric utilities in a rather negative way as it demonstrated an idea quite generally held by utility engineers, that the direction of development of the gas turbine was more logically toward power for transportation than for large unit production of electricity. To study the problems of transmitting power at potentials as high as 500,000 volts, the American Gas and Electric Service corporation, in co-operation with three utilities and nine manufacturers, announced the erection of two test lines each one and one-half miles long. The highest potential in operation in 1945 was 287,000 volts. Reports of U.S. engineers sent into Germany to study technical advances in that country before and during the war disclosed little that could be considered improvement on U.S. practices. However, certain German air circuit breakers, rated 100,000 volts and up and that were said to have performed excellently under severe conditions, were brought over and were being tested in the United States. Fluorescent lighting in spite of its wide application had been feared by many as harmful to human eyes. This fear was dispelled officially by an opinion published in the *Journal of the American Medical Association*. (See also PUBLIC UTILITIES; TENNESSEE VALLEY AUTHORITY.)

## Electric Transportation.

More progress was made in electric transportation in 1945 than in any other recent year. Notable innovations took place in vehicle design. Orders were placed for a substantial amount of new equipment. Extensions and improvements to existing facilities were planned in many cities in the United States and Canada. Renewed activity appeared also in the field of heavy electric traction.

**Urban Electric Transit.**—The unusual interest and activity in the field of urban electric transportation was part of a general increase of interest in public transportation. When the operation of private automobiles had to be curtailed because of war conditions, it was found that public transportation facilities were able to handle a large increase in riding with a noticeable decrease in street traffic congestion. From this experience there developed a widespread feeling that public transportation should be given a prominent place in postwar city planning. The ability of electric transportation to handle satisfactorily a maximum number of passengers per vehicle focussed special attention on this type of service.

**Volume of Riding.**—All forms of local public transportation showed substantial increases in patronage until the end of the war. Thereafter, riding declined moderately. For the year 1945 as a whole the number of passengers carried was slightly greater than during the record-breaking year of 1944.

*Ten-Year Record of Passengers Carried by Electric Transportation in the United States 1936-45*

Year	Surface Railway*	Subways and Elevateds	Trolley Coach Lines	Total†
1936	7,501,000,000	2,323,000,000	143,000,000	9,967,000,000
1937	7,161,000,000	2,307,000,000	289,000,000	9,757,000,000
1938	6,545,000,000	2,236,000,000	389,000,000	9,170,000,000
1939	6,171,000,000	2,368,000,000	445,000,000	8,984,000,000
1940	5,943,000,000	2,382,000,000	534,000,000	8,859,000,000
1941	6,081,000,000	2,421,000,000	652,000,000	9,154,000,000
1942	7,290,000,000	2,566,000,000	899,000,000	10,755,000,000
1943	9,150,000,000	2,656,000,000	1,175,000,000	12,981,000,000
1944	9,520,000,000	2,620,000,000	1,230,000,000	13,370,000,000
1945	9,600,000,000	2,640,000,000	1,250,000,000	13,490,000,000

(Data from American Transit Association; 1945 figures based on preliminary reports.)

\*Figures include riding in both urban and suburban areas, but the suburban riding represents only a very minor part of the total.

†Statistics of passengers carried by electrified suburban and trunk line railroads not available for presentation in this form.

Electric transportation continued to be the most important element of public transportation in urban areas throughout the U.S., carrying well over 60% of the total number of passengers. Street railways handled about 9,600,000,000 riders during the year, subway and elevated rapid transit lines about 2,640,000,000 and electric trolley coaches about 1,250,000,000. In contrast to this total of more than 13,000,000,000 passengers carried by means of electric transportation, motorbuses carried only some 8,500,000,000 riders in urban areas.

To handle this huge volume of riding there were in operation 118 electric railway and electric trolley coach companies and 379 motorbus companies. Many of the electric transit systems also operated motorbus service, but it is significant that the largest part of the bus riding was in the smaller cities, and that two-thirds of the all-bus companies were in cities of less than 50,000 population.

**New Rolling Stock.**—Because of war conditions the electric transportation industry was able to secure only a limited amount of new rolling stock. No new rapid transit cars were placed in service after 1940. During this period a little more than 1,200 new streetcars were put in operation in the U.S. and about the same number of electric trolley coaches. Restrictions imposed by the War Production board on the building of new transit vehicles were lifted in May 1945, but this did not allow sufficient time for any large number of new vehicles to be built and actually placed in operation during the year. A total of more than 2,000 new streetcars and an even larger number of

electric trolley coaches were ordered during 1945 or included in modernization plans under consideration in numerous cities in the United States and Canada.

**Modernization Plans.**—The City of New York laid out a \$1,000,000,000, six-year transit improvement plan, including new subway construction, extensions to existing rapid transit lines and notable expansion of electric trolley coach operation. At Chicago, Ill., it was proposed to purchase 400 new streetcars and 210 trolley coaches. Completion of the remainder of the subway system in that city was also being urged.

Philadelphia, Pa., announced a five-year program involving the purchase of 300 cars and 250 trolley coaches. San Francisco, Calif., was considering the purchase of 313 cars and 223 trolley coaches. Cleveland, O., had a transit improvement plan involving the construction of a rapid transit subway in the heart of the city and the use of a large number of trolley coaches as feeders on the surface.

Of special interest is the plan proposed for the Boston area by a special commission of the Massachusetts legislature. This contemplates the extension of the rapid transit system by the conversion of about 70 mi. of steam railroad track to electric operation and the establishment of connections at or near the ends of the existing subway and elevated railway lines. A total of nearly 500 new cars was proposed for this operation as well as a large number of trolley coaches as feeders. Independently of this, the Boston elevated railway was planning to install 128 new trolley coaches in the near future.

**Trolley Coach Expansion.**—In addition to the cities already mentioned, many others were planning extensions or improvements to their electric transportation systems, particularly by means of trolley coaches. In some instances the trolley coaches were to take the place of streetcars. In others they would replace motorbuses. The success that attended the establishment of many new trolley coach systems established just prior to World War II is undoubtedly the reason for the upsurge of interest in this type of operation. The quiet rapid operation of the electric trolley coach together with its ability to pick up and discharge passengers at the curb appealed strongly to the riding public. Polls taken among transit riders in a number of cities indicated that the electric trolley coach was the most popular of all transit vehicles. From an economic standpoint it is significant that trolley coaches carry more passengers in proportion to the investment in plant and equipment than does any other form of transit service.

**Improvements in Design.**—Notable improvements were made in design of electric transportation vehicles. The outstanding features of rubber springing and high acceleration that characterized the original P.C.C. type (basic features of design determined by the Electric Railway Presidents' Conference committee) streetcars were retained in the most recent types, while all-electric braking and standee windows were added. Better ventilation was also arranged. The desirability of air conditioning city transportation vehicles was widely recognized, but the frequency of door opening for passengers boarding and alighting resulted in such a great interchange of inside and outside air that the provision of air-conditioning equipment of adequate capacity presented a serious problem. In 1945, however, a special type of equipment was developed and installed on an experimental trolley coach built for service in Atlanta, Ga. In this respect electric transportation vehicles possess special advantages as compared with motor buses because an ample supply of electrical energy is always available from the overhead wires.

Operation of this air-conditioned vehicle proved so satisfactory that 30 more were ordered within a short time.

**Heavy Electric Traction.**—No extensions were made by the

electrified trunk line railroads in the U.S. during 1945, but equipment buying was resumed on a modest scale. Most unusual from the standpoint of design were four 8,000 horsepower electric locomotives for the Virginian railway. They were to be the heaviest and most powerful locomotives ever built. Two 5,000 horsepower electric locomotives were also ordered by the Great Northern railroad. In Brazil the Sorocabana and Paulista railroads, which were expanding their electric operations, placed orders for a total of 33 new locomotives to be built in the United States.

**Employment.** United States.—The civilian labour force (people available for gainful employment) numbered 52,900,000 in Sept. 1945; 130,000 less than in Sept. 1944, according to bureau of the census figures. The number of these who were unemployed was approximately 1,650,000 (3.1%) in Sept. 1945; and 790,000 (1.5%) in Sept. 1944. Within a month of the Japanese surrender, layoffs in war industries displaced about 820,000 workers—500,000 men and 320,000 women. This made the male unemployment 2.2% and female unemployment 3.5%.

Males still in employment numbered 33,320,000 and females 17,930,000. Females constituted 35% of the gainfully employed persons.

Employees in nonagricultural establishments numbered 35,268,000 in Sept. 1945; 1,500,000 less than in mid-August and almost 3,500,000 less than in Sept. 1944. The net decline from Aug.—Sept. 1945 reflected almost wholly the decline of 1,688,000 in the number of employees in manufacturing, nearly all of it being in war industries.

Table I.—Number of Production Workers and Indexes of Production-Worker Employment in Manufacturing Industries, by Major Industry Group, United States (Sept. 1945 and Sept. 1944) \*

Industry group	Number of production workers (estimated) in thousands		Production-workers indexes (1939 = 100)
	Sept. 1945	Sept. 1944	Sept. 1945

Transportation and public utilities . . . . .	3,836	3,836	3,830	3,818
Trade . . . . .	6,963	6,975	7,004	6,918
Finance, service and miscellaneous . . . . .	4,605	4,672	4,589	4,582
Federal, state, local government, excluding federal force-account construction . . . . .	5,916	5,921	5,953	5,869

\*Compiled from reports of Bureau of Labor Statistics (Washington). Estimates include all full- and part-time wage and salary workers in nonagricultural establishments employed during the pay period ending nearest the 15th of the month. Proprietors, self-employed persons, domestic servants and personnel of the armed forces are excluded.

In durable goods the shrinkage of the index of employment was from 181.1 to 141.6; in nondurable goods it was from 112 to 109.3 (1939=100). The numbers and indexes of manufacturing employment in Sept. 1945 and Sept. 1944 are shown in Table I.

Employment on construction work moved in the opposite direction (Sept. 1944 to Sept. 1945). There were 1,100,800 employed in Sept. 1945, 260,400 above the number employed in Sept. 1944.

Table II shows the numbers employed in nonagricultural employment in Aug. 1944 and in three months of 1945.

There were 12,090,000 women in the labour force in Dec. 1941 in the United States; 16,480,000 in March 1944; and 18,650,000 in Sept. 1945. The increase of 6,560,000 was approximately 5,000,000 more than the growth of female labour supply expected on the basis of prewar experiences.

Table III gives indexes of employment and pay rolls of selected nonmanufacturing industries in 1944 and 1945. The wide variation in degrees of change from one year to the other in the mining as compared with the other industries is a striking feature of the table.

"TAG." A reversal in the labour market toward the end of 1945, pictured by Shoemaker of the *Chicago Daily News*, followed the end of war contracts and the start of reconversion, easing a four-year manpower shortage

UNEMPLOYED, queued up to apply for work at the U.S. Employment service in Detroit, Mich. WMC director Paul V. McNutt estimated a decline of 600,000 jobs in munitions plants between March 15 and June 1, 1945

Table III.—Indexes of Employment and Pay Rolls in Selected Nonmanufacturing Industries, United States (1939 = 100)\*

†Not available.

**Great Britain.**—The total working population of Great Britain increased from 19,750,000 in mid-1939 to 21,337,000 in Sept. 1945; as indicated in Table IV.

Table IV.—Total Working Population (exclusive of domestic servants) Great Britain: Mid-1939 and Sept. 1945

	Mid-1939	Sept. 1945
Males	14,656,000	14,831,000
Females	5,094,000	6,506,000
Total	19,750,000	21,337,000

By Sept. 1945, 260,000 returned service men were in the labour supply. Of these, 4,482 were not in jobs in Oct. 1945. Unemployment was at a low level up to the end of 1945. In 1939 there was an average of 1,480,324 unemployed who were registered for insurance benefits. Table V shows the contrast in 1945.

Table V.—Unemployed, Registered for Insurance Benefits, in Great Britain, in Three Months of 1945, by Sex\*

	April 1945	July 1945	Oct. 1945
Males	56,322	68,469	131,832
Females	22,721	34,894	101,494
Total	79,043	103,363	233,329

\*These figures, which included 45,864 married women (October) are amazingly low unemployment figures for a labour supply of more than 21,000,000.

The labour supply increased 2,500,000 from 1939 to mid-1943; then decreased 944,000 to Sept. 1945. The reduction resulted largely from the retirement of women from employment

Table VI.—Employment, by Industry Groups, Great Britain (Sept. 1945)

Manufactures	3,658,000
Metals and chemicals	1,653,000
Other manufactures	2,005,000
Basic industries and services	5,118,000
Building and civil engineering	790,000
Distributive trades	1,990,000
Other services	1,495,000

to domestic life and the decline in intake of new labour supply from the nonindustrial section of the population as the war emergency passed. The ministry of labour forecast (Oct. 1945) that, by the end of 1945, the decline in labour supply which started after the peak employment of 1943 would amount by Dec. 31, 1945, to 641,000 men and 1,555,000 women; a total of 2,196,000.

The distribution of the employed population of Great Britain among the industry groups is shown in Table VI.

**Canada.**—The general employment index (1929=100) was 151 in Aug. 1945, compared with 155.9 in Aug. 1944. The British ministry of labour reported that manufacturing employment in Canada was 9.3% lower in Aug. 1945 than in Aug. 1944.

**South Africa, Union of.**—The South Africa general employment index (1929=100) was at 160.7 in April 1945 and 159.8 in June 1945, about three points higher than throughout 1944.

**Australia.**—The employment index dropped 3% from April 1944 to April 1945; to approximately 130 (1930=100). The trade union unemployment figures were below 10,000 persons throughout 1944 and the summer of 1945.

**South America.**—Argentina's statistics showed that industrial employment had remained at 31% to 33% above 1937 after Sept. 1944. Very little change occurred in the index of Argentine employment throughout 1942-44. The index for Chile was 126.4 in March 1945 (1937=100). Employment had remained at approximately that level after 1941.

**Sweden.**—The Swedish index of industrial employment, contrary to those of other countries, showed lower employment in 1945 than obtained from 1935 through 1944. The index dropped from 116.9 in Dec. 1944 to 92.8 in Jan. 1945 and was only 95.2 in April 1945 (1929=100). It was 99 in August. This was the lowest level of employment in Sweden after 1934. The trade unions reported 3.5% of their members unemployed in July 1945.

None of the other countries published employment statistics in 1945.

**Endocrinology.** **Thyroid.**—Using the heart rate and O<sub>2</sub> consumption as indices of thyroxine action, P. E. Kellaway *et al.* showed that the same amount of this hormone is more effective after hepatectomy than when the liver is present. Tying the bile ducts did not have the same effect as hepatectomy. The liver therefore does not inactivate excess thyroxine by excretion into the bile. There is suggestive evidence that the "tyrosine" rings of thyroxine may be broken by the action of liver enzymes. This emphasizes again the necessity of an adequate protein, carbohydrate and vitamin intake in hyperthyroidism, to protect the liver which can then help in destroying excess thyroid hormone.

**Adrenal Cortex.**—A. White and associates studied the role of the adrenal cortex in the control of lymphoid tissue. They had shown that adrenalectomy caused an increase in the number of circulating lymphocytes and in the amount of lymphatic tissue. A decrease in circulating lymphocytes and shrinkage of lymphatic tissues followed stimulation of the adrenal cortex, by the adrenotropic hormone of the pituitary. These investigators

found that simultaneously with the decrease in lymph tissue there occurred a rise in plasma globulin. They also found that extracts of lymphocytes contained a protein identical with the  $\gamma$ -globulin of blood plasma. They concluded that lymphatic tissue is a storehouse and perhaps the site of manufacture of globulins and that the release of these plasma proteins is under adrenal control. Since the globulins play a role in antibody formation, this finding has significance in the understanding of immunity reactions and implicates the endocrines for the first time in body defenses against micro-organisms.

It has been generally assumed that the medulla and the cortex of the adrenal are related only in an anatomical sense. Functionally, these endocrine glands were supposed to be distinct entities. However, newer work tended to show that there is a close functional relation between adrenalin, the internal secretion of the medulla, and the steroid hormones of the cortex. M. Vogt demonstrated that the injection of adrenalin caused a release of cortical hormones into the blood (as determined by bio-assay). Stimulation of the splanchnic nerves produced the same results, despite the fact that no nerve elements are found in the adrenal cortex.

C. N. Long and E. G. Fry showed that the cholesterol and ascorbic acid contents of the adrenal cortex were decreased following adrenalin injection into normal animals. Such an action is typical of adrenotropic activity of the pituitary. This was substantiated by the fact that adrenalin did not exert its effect in hypophysectomized animals.

These studies demonstrated the functional relationship between medulla and cortex and threw light on the mechanism of adrenal cortical reaction to such stresses as cold, burns, haemorrhage, surgical procedures, etc. The pathway is probably:

stress  $\rightarrow$  adrenalin  $\rightarrow$  (pituitary?)  $\rightarrow$  adrenal cortex  $\rightarrow$  increase of corticosteroids in blood and urine.

**Pancreas.**—In 1943, J. S. Dunn and his co-workers discovered that alloxan injected into rats will produce a necrosis of the beta cells of the islets of Langerhans. This resulted in a permanent diabetic state in their animals. Afterwards this phenomenon was studied in many species under a variety of conditions. In all cases the alpha cells of the islets were not affected. Recently E. Thorogood and B. Zimmermann compared the diabetic syndrome of alloxanized dogs before and after surgical removal of the pancreas. They found that before the pancreatectomy there was intense glycosuria and little ketosis, and these animals survived several weeks without insulin therapy. After the pancreas was removed the syndrome changed so that the glycosuria was less intense, there was more ketosis and the animals needed insulin even in short survival experiments. The authors postulated the existence of a hormone in the alpha cells of the islets which induces more ketone production and lessens the sugar output. If this work were further confirmed and extended it might throw considerable light on human *diabetes mellitus* which shows variations from patient to patient, and at different age periods. If the alpha cells are implicated in certain aspects of the diabetic syndrome, a better correlation between the clinical picture and pathological findings in the pancreas may be established.

**Ovary.**—The onset of menstruation is preceded by a decrease in the secretion of the sex hormones by the ovary. Following the withdrawal of hormonal support the uterine mucous membrane or endometrium is shed. The separation of the endometrium is probably due to vascular changes (in the so-called spiral arteries) which produce anoxaemia and cell necrosis. O. W. Smith and G. V. Smith showed that in the blood of menstruating normal women and of patients with toxæmia of pregnancy (a condition also associated with ovarian hormone withdrawal) there was a substance closely related to the "necrosin"

found in experimental pleural exudates. This material, when injected into experimental animals, caused local dissolution of tissue and general malaise and fever. They suggested that this substance plays a role in the uterus during normal menstruation, and that it may be involved as an aetiological factor in the toxæmias of pregnancy.

Because of structural relationships, cholesterol was assumed to be the parent substance of the steroid hormones secreted by the gonads and the adrenal cortex. However, there was no direct proof of this assumption. K. Bloch demonstrated that when cholesterol containing heavy hydrogen atoms (deuterio cholesterol) was ingested by a woman in the third trimester of pregnancy, the pregnandiol excreted in the urine could be shown to have been derived from the fed cholesterol. Since pregnandiol is a metabolic derivative of progesterone, cholesterol was shown to be the precursor of this hormone. This demonstration added more functional significance to the reported changes in cholesterol concentration of endocrine glands under varying experimental and clinical conditions. **England:** see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

**English Literature.** The year which brought peace back to England and the world did not, unfortunately, bring peacetime conditions back to English literature. It was indeed in 1945 that war's ravages and the difficulties both of authors to write books and publishers to produce them were more severely felt than ever before. Nevertheless, it is remarkable how, in a reduced output, a high proportion of books of interest and real literary value was maintained.

In poetry, there were at least a half-dozen books that would have been outstanding under any conditions. Louis MacNeice's collection *Springboard* showed the maturing of a talent, always accomplished, imaginative and saltily individual. George Barker's *Eros in Dogma* was also a highly original work by a young poet who was evolving a new eloquence from what seemed at one time an overelaborate and mannered style. Both these books were more human in their appeal than the book of their contemporary, in America in 1945, W. H. Auden; *For the Time Being* was nevertheless an intellectual tour de force of the first order and a searching analysis of the spiritual needs of our time. From a rather older generation, Walter de la Mare's *The Burning Glass* claimed attention for a number of lyrics in which the sufferings of today were poignantly expressed with all the technical and imaginative resources of an assured, individual artist. The younger generation in uniform contributed two volumes which were, tragically enough, epitaphs as well as milestones of progress: in both Sidney Keyes's *Collected Poems* and Alun Lewis's *Ha! Ha! Among the Trumpets* what is striking is the sense of desolation and the ruin of love and happiness in our time; Keyes is probably the more natural poet of the two, Lewis the more human and affecting. An anthology

of note was Robin Fedden's *Personal Landscape*, selected from the work of a group of young writers isolated in the middle east by the circumstances of war. Two poetic plays also deserve mention: Peter Yates's interpretation of the tragedy of John Wilkes Booth in *The Assassin*, and Edward Sackville-West's *The Rescue*, an essay in radio drama of importance to all who are interested in the development of this medium.

In fiction, two works stood out both for their craftsmanship and for their mordant comment on the world in which we have lived for the last quarter of a century: Aldous Huxley's *Time Must Have a Stop* and Evelyn Waugh's *Brideshead Revisited* were alike for their display of abundant gifts of wit and comic invention, alike too for the picture of spiritual dedication in an evil world which supersedes the comedy before the end. Rosamond Lehmann's *The Ballad and the Source* and L. P. Hartley's *The Shrimp and the Anemone* were both sensitive re-creations of the mysteries and terrors of childhood by experienced craftsmen, the former being especially notable for the richness of orchestration in its style. Henry Green's *Loving* marked a further progress in that combination of poetic symbolism and satiric comedy which has been the peculiar achievement of a difficult but highly talented novelist. A novel apart from the main stream was *All Hallows E'en*, a strange, absorbing study of life after death, by the poet Charles Williams whose death was a serious loss to English literature during 1945. One of the most gifted of the younger generation of writers, Denton Welch, published a further instalment of semi-fictional biography with *In Youth is Pleasure*, and Elizabeth Bowen in *The Demon Lover* proved herself again without rival in her special field of the highly wrought, atmospheric short story.

In biography and autobiography, successes of a more than ephemeral significance were scored by Sir Osbert Sitwell in *Left Hand, Right Hand*, the first volume of a trilogy which was likely to be fascinating for its evocation of a vanished society as well as for the personal story of a distinguished literary figure; by Lord Berners, who drew a witty and sensitive picture of his brief career at Eton in *A Distant Prospect*; by Margaret Cole in her biography of *Beatrice Webb*, and by Jack Simmonds in his study of a once dominating literary figure, *Southey*. In criticism, a book of exceptional importance, controversial though many of its conclusions may be, was Dr. E. M. W. Tillyard's *Shakespeare's Historical Plays*, while Sir Herbert Grierson and Dr. J. C. Smith attempted afresh an all but impossible task in their *Critical History of English Poetry*, valuable in particular for the chapters on Scottish poetry and the romantics. Three outstanding literary figures of our time were the subjects of interesting monographs, by Edward Thompson on Robert Bridges, by W. H. Gardner on *Gerard Manley Hopkins* and by Joan Bennett on *Virginia Woolf*, while William Gaunt made a lively and engrossing book out of the story of Whistler, Wilde and their contemporaries in *The Aesthetic Adventure*. In a class apart was Dr. C. M. Bowra's erudite but sparkling study of the epic, *Virgil to Milton*. In *British Architects and Craftsmen* Sacheverell Sitwell paid a glowing tribute to the post-mediaeval manifestations of the domestic arts in the British Isles; and in *The Years of Victory* Arthur Bryant carried his epic story of England's struggle against Napoleon one masterly step further.

Among many records of war experience, both individual and general, which were published in 1945, Alan Moorehead's account of the end in Italy and Germany in *Eclipse* must be singled out for its rare qualities of mind, sympathy and observation. Finally, five books, all difficult to classify but of unusual quality, cannot be omitted: Lawrence Durrell's description of the island of Corfu in *Prospero's Cell*; George Orwell's irrever-

ent satire on revolution and dictatorship, *Animal Farm*; *The Unquiet Grave*, a book of elegiac meditations by "Palinurus"; William Plomer's collection of verse, satire and extravaganza *The Dorking Thigh*; and H. G. Wells's sombre and unforgettable declaration of despair, *Mind at the End of its Tether*. (See also AMERICAN LITERATURE; BOOK PUBLISHING.) (J. F. LE.)

**Entomology.** Entomology and World War II.—During the years of World War II the United States and its Allies accomplished more in certain of the sciences than had been done throughout all the ages of the past. The discoveries and developments in the relatively little known field of entomology were among those advanced most. During no other war or period of history had this relatively obscure and often ridiculed science been so important and received so much painstaking consideration and support by the armed forces at home and abroad, especially in the tropical theatres of warfare. The particular phases of entomology that were developed most were: (a) medical entomology, which has to do with the protection of human health from the torment of insects and the very disastrous diseases carried and transmitted to man and his domestic animals by insects; (b) agricultural or economic entomology which is concerned with the preservation of growing crops, harvested and stored foods, and the protection and conservation of domestic animals and all their various important products against the attacks of insects; (c) and insect toxicology or the development of chemicals and other means for the control and extermination of injurious insects wherever necessary.

**Medical Entomology.**—By far the most important developments in entomology during the war had as their objectives the protection of human health and especially the armies in training at home and in action on foreign fields. The most urgent medical problem in all theatres of the war in the warmer temperate and the tropical areas was malaria. It was very early evident that this disease would so deplete the armed forces that its control and suppression were absolutely necessary for successful operations at home and abroad. The creation of malaria control units became important parts of the medical and sanitary organizations of the armed forces throughout the entire world. Other

INSECTICIDE blower spraying shade trees with DDT in a demonstration by the U.S. Bureau of Entomology and Plant Quarantine on Aug. 22, 1945. The blower reduces the usual volume of insecticide needed because of special nozzles which permit a highly concentrated spray

almost equally important insect-borne diseases were the flea- and louse-borne typhus fever, the mosquito-transmitted dengue fever, filariasis and encephalitis.

On mosquitoes alone the amount of investigational work and the resultant publications on the systematics, distribution and control amounted to what appears to be greater in scope and volume than had been accomplished during all previous time. The collecting, systematizing and publishing of all this vast array of technical study would require the attention of specialists for years. The great success in the control and almost annihilation of mosquitoes and malaria was due to the adaptation of a previously little-known insecticide, DDT, discovered in Germany and first used in Switzerland where it was patented and from whence it was brought to England and the United States for possible use and development. Its effectiveness in killing mosquitoes and the adaptation and equipment for controlling mosquitoes and malaria were developed in the U.S. It will be discussed more fully under *Insect Toxicology*.

Entomologists played an important part in the control of mosquitoes and malaria. Altogether there must have been no less than 2,000 of these trained men engaged in this important work in the U.S. armed forces at home and abroad. Many of these men were highly trained and well experienced entomologists and were officers attached to sanitary corps or directly in charge of malaria, dengue fever and filariasis suppression in districts, regions or islands, often of considerable size. Others were engaged in surveys and investigational work of great importance. The results of these efficiently organized programs can only be estimated in terms of the successes of the armed forces in all training, combat and occupational areas, not only of U.S. forces, but also those of all the Allies. The cleaning up of occupied North Africa, southern Europe, southeastern Asia and the South Pacific islands, including the Philippines and Japanese empire, was made possible by the skilled and efficient entomologists whose initial conquest of insects made reconstruction and rehabilitation possible.

*Agricultural Entomology.*—The success of any war depends as much, if not more, upon food as upon equipment, ammunition and transportation. Unfortunately those in charge of armies and navies often overlook the part of agriculture in winning wars.

In their programs of training and equipping armed forces, the U.S. often seemed to disregard the importance of food production and conservation at home. The control of the insect destroyers of growing food crops, of domestic animals, of stored food products at home, in transit and in warehouses abroad were often neglected in spite of the many urgent requests of the economic entomologists for more help and for an adequate supply of insecticides and equipment for the proper conduct of their work at home. Too often there was an acute shortage of nearly all important and necessary insecticides which greatly handicapped the control of the multitudinous insects which regularly take a yearly toll of about 20% of all crops in years when insecticides are abundantly available.

Rotenone, pyrethrum and nicotine compounds, so necessary in the protection of vegetable crops, were almost completely restricted for aerosol bombs, sprays and dusts for the armed forces. Arsenical poisons, sulphur and fluorine compounds, oils, cyanides and other necessary insecticides were often extremely scarce or altogether unavailable. The newly discovered DDT also went to war and only small allotments were made available for small-scale investigations and tests against agricultural insect pests.

During the war period there was also a trying shortage of spraying, dusting and fumigating equipment, and parts for the old equipment that was fast wearing out. Suitable labour found

A DDT MIXTURE being sprayed at an elephant in the Central Park Zoo, New York, in Sept. 1945, to free him of the countless winged pests lodged in his hide

more remunerative jobs in shipyards and other manufacturing industries which attracted even the boys and girls from the farms.

In spite of these handicaps the ingenuity of the entomologists functioned as well at home as abroad and rendered the same exacting service for the protection of food crops and animals under even more trying conditions.

*Insect Toxicology.*—Because of the scarcities due to priorities governing the use of practically every important insecticide, during World War II the chemical and insecticide manufacturers sought diligently to discover and provide new insecticides, many of which showed great promise. Thus DDT, which had been hailed as one of the greatest achievements of World War II, DD, and ethylene dibromide (soil fumigants), aerosols, new insecticidal smokes and vapours, sabadilla (a possible rival of rotenone), pyrethrum, nicotine and many newer promising organic compounds were synthesized and tested for insect control. Never before had there been such a gigantic, organized research program for the subjection of insects.

**DDT.**—This insecticide kills insects by body contact and by absorption through the exoskeleton and the feet. Insects which have been subjected to it show these symptoms: They become restless; drag their legs; have jerky, spasmodic, uncontrolled movements; lie on their backs, kick their legs in the air and are unable to right themselves; develop tremors; often move away from treated areas and may require as long as several hours, days or even weeks to die.

*DDT Compounds.*—DDT is seldom used in the pure condition. It is usually dissolved in a solvent and applied as a spray or mixed with a powder and applied as a dust or a water spray. The various types of material prepared for application follow:

(1) *Aerosols or aerosol bombs.* These were developed chiefly for use of the armed forces. The bomb is the container, usually metal, in which the insecticide is held. It does not explode. The aerosol is the insecticide contained in the bomb. It consists of the DDT together with some other material in liquefied gas under pressure. The contents are discharged by opening a valve which releases the pressure causing the dispersal of the insecticide in the air as a mist or fog which rapidly diffuses. The small particles hit the insects and kill them by direct contact.

Aerosols are used chiefly for such flying insects as mosquitoes, flies, gnats, sandflies, clothes moths and others in dwellings, factories, hospitals, aeroplanes, tents and similar confined areas. Aerosols are useless for the control of such crawling insects as lice, fleas, cockroaches, earwigs, caterpillars, as well as the various immature stages of most insects. It is not classified as a fumigant.

(2) The fog method of applying DDT in concentrations of 2% or 3% has proved quite effective for many purposes. The fog can be blown great distances and is quickly applied in barns, houses, tents and other buildings to kill adult flies, mosquitoes, gnats, sandflies and other tormentors of man and domestic animals. It has also been used to treat stadiums, parks, beaches and other large open gathering places to free them of these insects.

(3) As a 2% or 3% dust for the control of many insects that infest truck crops, field crops, fruits and other agricultural products. It was

found effective in controlling leaf hoppers, onion thrips, pear thrips and other species of thrips, some aphids, plant bugs, flea beetles, Colorado potato beetle, pea weevil, Japanese beetle, rose chafer, potato tuber moth, corn-ear worm, cabbage worm, oriental fruit moth, codling moth, pickle worm, melon worm and many cutworms.

(4) As a 5% dust for the external parasites of animals and man, and for ants and many kinds of insects injurious to agricultural crops.

(5) As a 10% dust for external parasites of man including lice and fleas, and for the brown dog tick. It may also be used for cockroaches, silverfish moths and other household insects. For human lice 1.5 to 2 oz. should be used per individual.

(6) As a 50% wettable powder. This concentrated material may be diluted at the rate of from 1 to 2 lb. per 100 gal. of water and used as a spray for such insects as leaf hoppers, thrips, codling moth, oriental fruit moth, grape-berry moth; Japanese beetle (25 lb. per ac. appear to be as effective as 40 times as much arsenate of lead), rose chafer, pea weevil and probably many other similar insects. As a spray for lice on cattle, it should be used at the rate of 4 lb. to 100 gal. of water. One gal. should be sufficient to spray 3 large animals. As a dip for cattle, at the rate of 2 lb. to 10 gal. of water.

(7) As a 5% oil solution (in deodorized kerosene). It is extremely effective in killing bedbugs, flies, mosquitoes, clothes moths, some carpet beetles and many stored products insects, as well as termites in their burrows. Three liquid oz. are sufficient to treat the mattress, springs and frame of a bed. It may also be used as a residual spray to be applied to the walls of rooms, closets and chests. It will not stain wallpaper and clothing and remains effective for several months.

(8) As a 20% emulsifiable spray (a water miscible concentrate composed of 20 grams DDT for every 100 mm. of solution) is useful for killing lice, fleas, flies and other insects which frequent buildings, and has often been used for spraying all kinds of buildings, fences, boxes, screens, tents, autos and similar enclosed areas. For this latter purpose it is diluted at the rate of 1 gal. to 3 gal. of water. One gal. of this dilution will cover 1,000 sq.ft. of surface. Instead of using this combination many investigators preferred to use the wettable powder referred to above. The water mixture leaves the crystallized DDT on the surface of the sprayed areas and the latter remains effective longer than when applied in the oil solutions which are often absorbed. It is much safer, too, for animal dips and for the operators applying the material. Adding lime to any mixture reduces the effectiveness of DDT.

Tolerance of DDT residue: "No question is raised concerning the use of DDT on such fruits as apples and pears since it is less toxic than the other commonly used insecticides for these crops, such as lead arsenate and cryolite. . . For the present the Food and Drug administration will not take action against apples and pears containing not more than 7 mgs. of DDT per kg. of fruit." (Food and Drug and Cosmetic Act-Trade Correspondence, Nov. 5, 1945.)

**Pests Not Controllable by DDT.**—In spite of the remarkable insecticidal properties of this new chemical there were some agricultural and household insect pests and mites that did not appear to be affected by the application of DDT dusts and sprays. It was unsatisfactory for the control of many aphids, including the cabbage aphid, turnip aphid, melon aphid and others, and for the control of the Mexican bean beetle, the German cockroach, certain dermestid beetles and for orchard mites, red spiders, bud blister and gall mites.

**Destruction of Beneficial Insects by DDT.**—This insecticide is destructive to many kinds of beneficial predaceous and parasitic insects when used as a contact or residual dust or spray. It may suppress the natural enemies of many insect pests and thus permit the latter to gain considerable headway and even require additional control measures. Thus aphids often increase in great numbers, as a result of killing the ladybird beetles, predaceous bugs, green lacewings, brown lacewings, syrphid flies and the very effective hymenopterous parasites.

The rather critical situation relative to the possible killing of the honeybee and wild bees, thus decreasing the pollination of many essential crops, as well as curtailing the production of honey and beeswax, was greatly feared by many and was given much publicity. At first DDT was proclaimed "the destroyer of bees" because tests in hives and cages indicated this claim to be a fact. However, after two years of very intensive investigations and observations of large areas of alfalfa, vegetable and flower seed crops, it appeared that, while the bees are driven out of the freshly dusted fields for a period of three or more days, they return after that time in practically equal numbers and eventually actually build up their populations in the treated areas. This increase is due to the multiplication of the flowers as a result of the protection afforded them by the applications of DDT and thereby killing the lygus bugs which destroy the flowers and the seed crop. Careful observations during 1945 in Arizona, California, Oregon, Texas and Utah support this latter statement. In the case of fruit trees the honeybees alight directly in the flowers and if the trees are not sprayed during the blooming period no harm whatever befalls the bees.

**Ethylene Dibromide.**—This relatively new insecticide is especially useful as a soil fumigant for the control of nematodes, garden centipede, wireworms, white grubs and other subterranean plant pests. It appeared to be particularly promising for killing wireworms, but must be used on land free from growing plants.

**Benzine Hexachloride or 666.**—This new insecticide had, to a much lesser degree, somewhat the same type of publicity in Great Britain as DDT had in the U.S. However, it did not appear to be either as versatile or as effective as the latter, although it is quite similar in many respects and is effective in killing many insects. It appeared to be less toxic to man and domestic animals. It is usually applied as a powder and is quite toxic to plant bugs, granary weevils and other insects.

**Ortho-dichlorobenzene.**—This new insecticide gave very effective results in the control of many household and stored products insects as well as pests of fruit trees and many agricultural crops. It was used as a contact spray, as a solvent for aerosols and mixed with other insecticides. In its various forms it proved effective in controlling insects infesting seeds, aphids, clothes moths, bedbugs, body lice, flea beetles, caterpillars, termites, powder-post beetles in seasoned wood and bark beetles in branches

and trunks of living infested trees. It is deserving of much more extended investigation.

**Phenothiazine or Thiodiphenylamine.**—This relatively new insecticide continued to occupy an important place in the control of certain caterpillars which infest fruit trees.

## Epidemics and Public Health Control.

Outstanding was the continued progress in 1945 in use and development of the antibiotics, such as penicillin, streptomycin and streptothricin. F. L. Meleney reported that good results may be expected in 75% of cases of grave infection by haemolytic streptococci.

The action of penicillin, for practical purposes, may be considered to be bactericidal as well as bacteriostatic. Use of penicillin by mouth was reported extensively. According to P. György and his co-workers, penicillin calcium given orally with trisodium citrate was as effective in the treatment of gonorrhoea as the same dose given by injection. British observers felt that inhalation therapy is advantageous, especially for infants, because given otherwise it is rapidly excreted.

O. H. Robertson studied air-borne infection and pointed out how environment can be contaminated by diseased persons or carriers of pathogenic organisms which later remain in bedding and floor dust and then during cleaning are resuspended in the air.

Edward Bigg and co-workers were successful in instilling bactericidal concentrations of triethylene glycol (TEG) in large living quarters. They reported definite reduction of air infections.

Virus, viral or viroid upper respiratory and pneumonia infections were the subject of differing opinions as to cause, diagnosis and treatment. Titrations of cold haemagglutinin were intensively studied. C. L. Spingarn and J. P. Jones pointed out that in 89% of normal controls the titre was 1:56 or lower, and in

REPATRIATED French prisoners of war receiving the delousing treatment as part of their medical examination in Paris before returning to civilian life in 1945

11% reached up to 1:224. However, the titre was highest in patients with primary atypical (virus) pneumonia. Pneumonias of bacterial origin gave cold haemagglutinin titres lower than in the atypical (virus) type. However, the authors felt that cold haemagglutination is a nonspecific manifestation of certain types of antibody response rather than specific for atypical pneumonias.

Advice generally was given that the sulfonamides and penicillin are ineffective in viroid upper respiratory and pneumonia infections. Yet, its widespread use in these infections continued. J. J. Short reported good results with penicillin in viroid pneumonias. Others, from personal experience, felt that clinical application of penicillin does not always follow test-tube trend.

H. A. Reimann, *et al.*, reported a widespread, mild, apparently communicable type of diarrhoea, nausea and vomiting, called epidemic diarrhoea, nausea and vomiting. It was believed that a virus is the cause.

Vaccination against influenza, using a virus vaccine of .5 cc. type A and .5 cc. type B, was carried out in army specialized training program units of eight universities. Attack rate among those vaccinated was 2.22% and among controls 7.11%.

M. J. Romansky, *et al.*, reported on treatment of gonorrhoea with a single injection of calcium penicillin in beeswax-peanut oil. One injection produced cures in most cases, and assayable levels of penicillin in the blood were maintained for 7½ to 10 hours, with excretion in urine continuing for 24 to 32 hours. No abnormal reactions were seen locally or constitutionally. (See also BACTERIOLOGY; ENTOMOLOGY.)

**Estonia.** One of the Baltic states of northeastern Europe, north of Latvia, south of Finland, 16th republic of the U.S.S.R. Area, 18,371 sq.mi.; pop. (est. 1939) 1,122,000. Chief towns: Tallinn (capital 146,400); Tartu (60,100); Narva (24,200); Nomme (19,700); Pärnu (21,500). Language, Estonian (a Finno-Ugrian tongue). Religion, Christian (Lutheran 78%, Greek Orthodox 19%). Ruler in 1945: Russian military occupation, with local government under Johannes Vares as chairman of the supreme soviet of Estonia.

**History.**—After 20 years of precarious peace and independence Estonia's troubles began in 1939. In that year Germany started the sequence of events by the invasion of Poland. The U.S.S.R. then began to push its frontier westward, occupying eastern Poland and demanding strategic bases of Estonia (Sept. 29, 1939) and of the other Baltic states. In June 1940 the Rus-

sians occupied the country and in July held elections at which the people voted to join the U.S.S.R. When Germany attacked Russia, June 22, 1941, the Baltic states were overrun by the German armies—though the northwest section of Estonia held out for about six months. In 1944 the Russian counteroffensive swept back across Estonia; by the end of November the whole country was reconquered, and the following year was a time of slow but purposeful reconstruction. (See section on *Manufacturing and Mineral Production*.)

The Russians assumed that Estonia, long controlled by the tsars and incorporated in the soviet state in 1940, was once more one of the union republics of the U.S.S.R. The indictment of German war criminals referred to the Baltic states as within the U.S.S.R., but although Britain and the U.S. both signed this document they each specifically denied that the signature implied recognition of the Russian claim. The British foreign office made public a statement to this effect (Oct. 19). For the U.S., Justice Robert H. Jackson sent a letter to the Russian, French and British prosecutors saying that the indictment was signed with the reservation that he had no authority either to accept or to challenge the soviet sovereignty in the Baltic states. Legally the U.S. and Great Britain recognized a regime out of power from 1940, yet *de facto* control remained in soviet hands, and no other government appeared disposed to make a real issue of the matter.

Estonia faced major readjustment in its population. From 1940-41 unknown numbers of the people had been transported into central Russia or Siberia; other hundreds at least had been taken to Germany as forced labour in the period 1941-44; thousands fled to Germany or Sweden during the struggle of the great powers. One group bought a 30-ft. sloop in Stockholm and sailed to the United States. Some who could face the Russian control without fear gradually returned to their homes; but many had so compromised themselves against communism or against Russia that they dared not return. U.S. and British occupiers of Germany cared for thousands of Estonians and other Balts (of this group large numbers were, of course, nazi sympathizers); Sweden continued hospitality to thousands more. Military personnel among the refugees in Sweden were demanded by the Russians, but many of these staged a hunger strike or committed suicide and delayed the evacuation. Meantime large numbers of Russians seemed to be moving into Estonia, and plans were under way to expand Tallinn into a city of 500,000. For the most part, however, the western world was left very much in the dark about conditions and trends in the 16th republic of the U.S.S.R.

**Education.**—In 1937-38 there were 1,224 elementary schools, 58 middle schools, 39 technical schools and 30 agricultural schools. Tartu (Dorpat) university had 3,219 students and 217 professors in 1938. Under the soviet regime education is universal and compulsory.

**Finance.**—The monetary unit is the kroon (26.7 U.S. cents at par). Effects of monetary changes in 1941-44 were uncertain, but the Russians gave receipts for German marks turned in. What meagre reports reached the west in 1945 were in terms of rubles. Revenue (est. 1939-40) 99,293,000 kroons; expenditure 99,293,000 kroons.

**Trade and Communication.**—Imports in 1939 totalled 101,351,000 kroons; exports, 118,217,000 kroons. Principal imports were raw cotton, sugar, woollen yarns and thread, iron and steel. Principal exports were butter, wood and paper, cotton goods, cellulose, flax and tow, meat products and eggs. Imports were chiefly from Germany, Great Britain, Sweden, the United States and the U.S.S.R. Exports were chiefly to Great Britain, Germany, Finland, the United States and Sweden.

**Agriculture.**—Production (in short tons) of the leading crops

in 1939 was as follows: rye 250,994, potatoes 963,741, oats 164,684, barley 99,207 and wheat 94,026. Estonia in 1938 had 660,890 cattle, 649,730 sheep, 384,580 pigs, 219,020 horses and 1,596,570 chickens.

**Manufacturing and Mineral Production.**—Manufacturing production was valued at 166,238,000 kroons in 1937. One of the larger cotton mills in Europe was at Narva, where textile manufactures in 1937 were valued at 47,425,000 kroons. Other important industries were paper and wood, food products, cement, flax, leather. Shale oil production rose rapidly to 209,437 short tons in 1939. Approximately 60,000 people were employed in industry in 1938.

Industrial rehabilitation stood high on the U.S.S.R. priority list for Estonia, and according to the soviet *Information Bulletin* great progress was achieved even in the first six months of 1945. By May 1 the Tunnel furnace and shale refinery was restored and in the next four months produced 7,000 tons of shale grease. Other mines in Kivil and Kokhtla and elsewhere opened earlier and provided fuel for factories, power stations and railroads—353,000 tons of shale fuel altogether. Machine plants, glassworks, shipyards, lumber mills and furniture factories resumed operations. A cellulose paper factory produced 4,000 tons of cellulose, 2,600 tons of paper and 1,000 tons of cardboard in the period January to June. The great textile mills at Narva were scheduled to reopen with at least 25,000 spindles by the end of 1945.

(F. D. S.)

**Etching.** The year 1945, which brought to an end the long struggle of World War II, brought also a renewed activity in the field of etching in the United States. Practitioners of the art who had been absent in the armed forces began to return to their studios, many with sketches later to be transferred in more developed form to the copper plate; etching societies which had either suspended their activities or greatly limited them during the war years took on new life; museums and other art organizations renewed normal schedules. Because of the highly technical nature of the medium and the fact that it is not the only one of the graphic arts by which a design is made susceptible to multiplication, etching has always been practised by a comparatively limited number of artists, but the number of etchers in the United States increased rather than otherwise during the year 1945. Among its most active exponents may be

"IDA MAY" by John E. Costigan was included in the 1945 exhibit of the Society of American Etchers at the National Academy Galleries in New York

named Niels Y. Andersen, Isabel Bishop, Cornelius Botke, Theodore Brenson, J. Gross Bettelheim, John E. Costigan, Ralph Fabri, Isac Friedlander, Elias M. Grossman, Arthur W. Heintzelman, Eugene Higgins, Morris Henry Hobbs, Irwin D. Hoffman, Alfred H. Hutt, Armin Landeck, Lino S. Lipinsky, Luigi Lucioni, Joseph Margulies, Blanche McVeigh, Helen P. Miller, Martin Petersen, Fermin Rocker, Ernest D. Roth, Carl M. Schultheiss, Effim H. Sherman, Y. E. Soderberg, Sam Thal, Reynold Weidenaar, R. W. Woiceske, and George H. Wright. An active group under the leadership of Stanley W. Hayter, working in the so-called "modern" idiom, produced some interesting abstract designs, though mostly in line engraving. The American master, Frank W. Benson, ceased etching some years before and John W. Winkler and Cadwallader Washburn, other outstanding performers, produced no new work in 1945. Most of the many etching societies in the United States, among them the three largest, the Society of American Etchers, the Chicago Society of Etch-

ers, and the Print Makers Society of California, held their usual annual exhibitions, which included the work of practically all the etchers of the country. In addition, the Library of Congress held its great annual national exhibition, sponsored by the administrators of the Joseph Pennell fund.

British etchers carried on during the year 1945 with the same magnificent courage and perseverance displayed by all British artists, and the Royal Society of Painter Etchers, of which Sir Malcolm Osborne was president, held its usual exhibition in London. The Royal Academy had many etchers among the contributors to its annual show at Burlington house. Among the foremost British etchers of the year were Katharine Cameron, William D. Brokman Davis, Paul D. Drury, W. Russell Flint, H. A. Freeth, Sylvia Gosse, Martin Hardie, W. Westley Manning, John Nicolson, W. P. Robins, Henry Rushbury, Sara Sproule, Leonard Squirrell, Ian Strang, Robin Tanner and S. Van Abbe. The death of Sir Frank Short, the inactivity of Sir David Young Cameron, James McBey's transfer to American residence and citizenship, and the work of Sir Muirhead Bone in other fields, removed the four greatest names in contemporary British etching for the year 1945.

Many of France's etchers continued to work throughout the war, but the internal conditions resulting from it made publication and distribution almost impossible, so that little news of their production reached the outside world. In Nov. 1945, an exhibition of the work of such well-known performers of other years as Beurdeley, Jacques Boullaire, Jean Frelaut, Pierre Guastalla, Andre Jacquemin, Jacques Villon and Wehrin was held at one of the leading Parisian print galleries. An interesting international gesture was embodied in the showing in the 30th annual exhibition of the Society of American Etchers of a group of etchings by contemporary Frenchmen, H. G. Adams, Yves Alix, E. Cournault, Jean Deville, Anthony Gross, Joseph Hecht, Montandon and Charles Walch. These artists were all members of a group known as "La Jeune Gravure Contemporaine," headed by Joseph Hecht.

A strong group of Canadian artists, organized into the Society of Canadian Painter-Etchers and Engravers, with Nicholas Hornyansky as its president, held its annual exhibition in 1945. Among prominent etcher members were Woodruff K. Aykroyd, Isabel Cleland, John S. Inglehart, Wendell P. Lawson, I. MacKinnon-Pearson, Harry D. Martin, Jack Martin, Wilbur K. Peacock, Owen Staples, Cyril John Travers, Harry D. Wallace, Peter Whalley and W. J. Wood.

The only other countries whose artists were active in the graphic arts during 1945 were Mexico and the South American republics Uruguay and Argentina, but in all three lithography and woodcut predominated and little work in the medium of etching was published.

(J. T. AR.)

## Ethical Culture Movement.

A religious and educational movement emphasizing the centrality of ethics in human relations, started in New York city in 1876 by Felix Adler, and established ten years later in London by Stanton Coit. In 1945, societies were active in New York city, Westchester, Brooklyn, Philadelphia, St. Louis and Chicago, and groups were meeting regularly in Washington, D.C., and New Jersey. There were five societies meeting in London and one in Birmingham, England.

The Ethical Culture societies conduct Sunday and weekday services, and a variety of educational and community activities. University Settlement, the first neighbourhood house in the United States, was an enterprise of the movement, which was also responsible for significant efforts in child labour reform, visiting nurse associations, legal aid societies, housing, race relations, child study and progressive education. Considerable

literature dealing with the autonomy of ethics and the religious nature of ethical dedication was produced. In addition to war-time service activities, the English and U.S. societies devoted themselves to training of youth for democratic citizenship, extensive programs in adult education, the fuller realization of Negro rights, problems of atomic power and public policy and efforts aimed at the improvement of the public school system. The Conference on the Scientific Spirit and Democratic Faith held its annual meeting at the meeting house of the New York society.

Exposition of the movement's principles was to be found in Felix Adler, *An Ethical Philosophy of Life*, David Saville Muzey, *Ethical Religion* and Horace J. Bridges, *Some Aspects of Ethical Religion*. *The Standard*, edited by George E. O'Dell, was published each month at 2 West 64th St., New York 23, N.Y. The American Ethical union, of which Robert D. Kohn is president, had offices at the same address. The offices of the English Ethical union, of which H. M. Brailsford was president (1945), were at Chandos House, Buckingham Gate, London, S.W.1.

(J. NN.)

**Ethiopia.** A kingdom of northeast Africa. Area, c. 350,000 sq.mi.; pop. (est. Dec. 31, 1939) 9,500,000; cap. Addis Ababa; religion: Christian (Copt) and Mohammedan; languages: Amharic and Arabic; ruler: Emperor Haile Selassie I.

**History.**—The terms of the treaty concluded in 1945 between the British mission under Earl de la Warr and the emperor included: the return of the Jibuti railway to Ethiopia, together with certain cantonment areas and the Italian Somaliland frontier zone; tribes on the British Somaliland border to remain under British control; the British military mission with certain advisers to remain, and the Ethiopian army to continue to be trained by British instructors. An offer of a £3,000,000 loan in three years was refused, because it involved an Anglo-Ethiopian board. In February the emperor saw Prime Minister Churchill and President Roosevelt on their return from Yalta. The British Friend's ambulance unit, which provided half the European medical personnel, left the country shortly afterwards. A number of Negro educationists and scientists arrived from the United States. In September the Ethiopian representative at San Francisco signed an agreement for a 50-year oil concession to a U.S. concern, in exchange for the building and equipment of a hospital, one or more schools

PRES. ROOSEVELT and Emperor Haile Selassie during their meeting aboard a U.S. warship near Cairo in Feb. 1945. The president was en route to the U.S. from the Crimea conference

and scholarships to the United States.

Against this background, Ethiopia made strong demands at San Francisco and elsewhere for the ex-Italian colonies, particularly Eritrea, and for large reparations against Italy. It also made strong representation for relief from the United Nations Relief and Rehabilitation administration which sent a mission to Addis Ababa in Oct., 1945. (H. V. L. S.)

**Trade and Communication.**—Chief exports: hides and skins, coffee (14,300 short tons in 1937-38) and gold. Roads (1940) c. 4,340 mi.; railways (Addis Ababa to Jibuti in French Somaliland) 486 mi.

## European Advisory Commission.

The establishment of the European Advisory commission was announced in the joint communiqué of the Tripartite conference at Moscow which was published on Nov. 1, 1943. The communiqué stated in this regard, "the conference agreed to set up machinery for ensuring the closest co-operation between the three governments in the examination of European questions arising as the war develops. For this purpose the conference decided to establish in London a European Advisory commission to study these questions and to make joint recommendations to the three governments." The joint communiqué went on to point out that provision was made for continuing when necessary the tripartite consultations of representatives of the three governments in the respective capitals through the existing diplomatic channels.

The European Advisory commission met for the first time on Dec. 15, 1943, at Lancaster house, St. James's palace, London. The commission continued its sessions throughout the years 1944-45 and was active in negotiating the surrender terms which were subsequently applied to Rumania and Bulgaria. A large proportion of the commission's activity was naturally devoted to questions relating to Germany. The agreement on control machinery for Germany and the agreement on zones of occupation in Germany were negotiated in the summer of 1945. The Declaration Regarding the Defeat of Germany and the Assumption of Supreme Authority in Germany by the Four Powers was likewise negotiated in the commission and subsequently issued at Berlin on June 5, 1945. The commission likewise recommended the Agreement on Certain Additional Requirements to be Imposed on Germany, which was subsequently announced by the Control council in Berlin.

With reference to Austria, the agreement on control machinery in Austria and the agreement on zones of occupation in Austria were negotiated in the commission and subsequently approved and made public.

The United States representative on the commission in 1945 was Ambassador John G. Winant; the soviet representative was Ambassador Foydor Gousev; the British representative was Sir William Strang, who until this appointment was under secretary of state for foreign affairs in the British foreign office.

The French government was admitted to full participation in the European Advisory commission and was represented by René Massigli, the French ambassador in London. Each of the representatives on the commission was assisted by a staff supplied by his own government, and there was a joint secretariat composed of personnel supplied by the participating governments.

The Potsdam declaration recommended that, in view of the establishment of the Council of Foreign Ministers and inasmuch as the European Advisory commission had ably discharged its principal task, the commission be dissolved. As the French government later stated that it agreed with this recommendation, the four governments participating in the European Advisory commission considered that it was terminated. (H. F. Ms.)

## Exchange Control and Exchange Rates.

The situation of the international exchange markets in 1945 can be summarized as follows: Orderly monetary and foreign exchange conditions were maintained in the western hemisphere, in the greatest part of the sterling bloc, and in the neutral countries of Europe. The soviet union, of course, had its own monetary system. The technical position of the United States dollar remained very strong and it was clear that the dollar was becoming the basis of a new international monetary standard. The monetary reconstruction of the European nations was closely tied up with the renewal of production. The danger of inflation was great. Without ample supply of goods monetary measures alone would not suffice to check this movement.

**The United States.**—The gold stock of the United States decreased from \$20,619,000,000 in Dec. 1944 to \$20,030,000,000 in Nov. 1945 or by \$589,000,000. The reduction of the gold stock proceeded in a slower tempo than in the two previous years. Over the five years from July 1, 1940, through June 30, 1945, the U.S. government spent abroad \$13,045,000,000, of which \$4,000,000,000 to \$5,000,000,000 was spent to purchase vitally needed food and raw materials. A similar amount was spent to pay U.S. troops overseas. The government agencies held abroad more than 3,000 installations, acquired at a cost of \$2,413,000,000, of which 95% were military installations. Out of the total disbursements abroad of \$13,045,000,000, the amount of \$6,375,000,000 went to the British commonwealth; \$3,326,000,000 to American republics; \$986,000,000 to China; \$541,000,000 to France and its possessions; and \$127,000,000 to Italy and its possessions. (The U.S. government received from the British commonwealth \$2,460,000,000; from the American republics \$288,000,000; from France \$526,000,000; and from China \$149,000,000.) This source of dollar income was to be greatly reduced. With the end of the lend-lease supplies, the countries which had previously received them had to pay in dollars or obtain credit in dollars. The universal great demand for U.S. goods would logically stop further export of gold from the U.S. and tend to reduce the foreign-held dollar balances.

Foreign funds in the U.S. increased from \$7,423,400,000 on July 31, 1944, to \$8,296,800,000 on July 31, 1945, or by \$873,400,000. (The foreign banking fund included here went up from \$4,740,800,000 to \$5,442,600,000 during the same period.) As of July 31, 1945, Europe held \$4,140,600,000, a slight decline compared with the previous year; while Canada's balances went further up to \$1,361,400,000, Latin America's to \$1,411,700,000, and Asia's to \$1,175,500,000.

The technical position of the dollar remained strong, and it was becoming more and more a pivotal basis of a new international monetary system. The foreign exchange quotations in New York remained limited to the Latin American nations, Canada, the countries of the sterling bloc, Sweden, Switzerland, China and irregular quotations of Spain and Portugal. The quotation of the French and Belgian franc was again introduced.

During the fiscal year 1945, the Foreign Funds Control continued to freeze the assets held within the U.S. by persons in enemy, enemy-occupied and European neutral countries and to regulate the use to which such assets might be put. The purpose of these measures, however, was not to protect the U.S. dollar; it was not an exchange control, but belonged to the field of economic warfare. The aim was to prevent enemies from using,

\*Under law of Oct. 6, 1942, the cruzeiro became the unit of currency, replacing the milreis. From Nov. 1942, exchange quotations have been in terms of cruzeiros and centavos to the dollar.

†Disponibilidades propias (private funds).

‡New currency unit instituted as of Nov. 8, 1943. Paraguayan central bank establishes a "legal rate" from which buying and selling rates may vary by 1%. From July 13, 1944, the legal rate has been fixed at 3.09 guaranies to the dollar, resulting in buying and selling rates of 3.059 and 3.121, respectively.

§A decree of Nov. 18, 1944, fixed basic central bank buying and selling rates at 13.40 and 13.50 sucres to the dollar, respectively, but the imposition at the same time of a 2% charge on all exchange transactions has resulted in effective buying and selling rates of 13.132 and 13.77.

Note.—Special rates apply to automotive equipment and agricultural machinery imported from the United States into Argentina.

directly or indirectly, assets held in the U.S. and, furthermore, from acquiring assets belonging to the occupied countries.

With the end of World War II a general relaxation of the freezing of these assets could soon be expected. French, Belgian, Norwegian and also Finnish blocked accounts were released through issuance of a general license. It was stated, however, that before property was released, investigations had to be made to determine whether enemy interests were involved.

Canada.—The foreign exchange position of Canada remained strong. There was a further net influx of capital to Canada arising from net sales of outstanding securities to other countries, which amounted to \$97,000,000 in 1944 and totalled, for the five-year period 1939-44, to a net capital influx of \$436,500,000. The principal element in this influx of capital was the large volume of sales of Canadian bonds to the U.S. The tourist restrictions to the U.S. were further relaxed.

The Foreign Exchange Control board in Nov. 1945 slightly changed its selling rate for one U.S. dollar from \$1.11 Canadian to \$1.10½ Canadian. The buying rate of \$1.10 Canadian to one U.S. dollar remained unchanged. These rates translated into U.S. terms were for official Canadian dollars, 90.90 U.S. cents to buy and 90.50 U.S. cents to sell.

Latin America.—The technical position of the majority of Latin-American currencies continued to be good in 1945. The pressure on the domestic level of prices, however, did not ease up; in several countries the governments attempted to immobilize a part of the excess purchasing power through foreign exchange transactions. The danger of inflationary price developments had not yet disappeared by the end of the year.

Countries which were greatly dependent on the export of minerals and metals—Bolivia, Chile, Peru—showed apprehension as to the future of these exports. The purchases of the U.S. would hardly continue on the war scale.

In 1945 all except seven of the Latin-American republics maintained exchange control; these were Cuba, Dominican Republic, El Salvador, Haiti, Guatemala, Mexico and Panamá. In Peru exchange control was introduced in Jan. 1945.

As in 1944, the exchange control in 1945 was carried out in a liberal way, exchange restrictions being applied to unnecessary payments while

permits for current transactions were mostly obtained automatically. Very liberal regimes in this respect existed especially in Argentina, Colombia and Venezuela. As things stood at the end of 1945, a number of countries were able to go on operating without any significant exchange control. The original purpose of the exchange control, however, had changed in the meantime. Introduced to protect the exchange stability, it was in later years used for the protection of newly-developed industries and also for subsidizing of exports. There was also a new reason for exchange control. Some countries were anxious to prevent the spending of their accumulated dollar balances on the import of luxuries or goods considered unnecessary, because they desired to give priority to the import of capital and durable consumer goods.

The system of multiple exchange rates was maintained in some countries partly for fiscal purposes, partly as providing means for subsidizing export. For instance, in Venezuela the oil companies sold to the Central bank the exchange necessary for providing them with the bolívares for paying their expenses in the country at the fixed rate of 3.09 bolívares per dollar; the coffee exporters sold their dollar at the rate of 4.80 bolívares per dollar (in the case of washed coffee) and the cacao exporters at the rate of 4.25 bolívares. The exporters of other goods were allowed to sell their exchange in the unofficial or uncontrolled market. In the exchange market the rate of 3.35 bolívares per U.S. dollar was maintained from May 1942.

In Bolivia the percentage of exchange which had to be delivered by tin exporters was increased in 1945 (from 42% to 60% for exporters of highest grade ores). The percentages of exchange which had to be delivered by exporters of agricultural products, nonmineral raw materials and industrial goods were all revised upward. The import quota system established on the monthly basis was used by the government to an increasing extent as a general means of controlling business. The exchange rate for bolívares in the

curb market in Aug. 1945, reached 60 bolívares per U.S. dollar as compared with an average of 51.80 in 1944.

In Chile the National Foreign Trade council pursued consistently the policy of preventing the country's foreign exchange resources from being wasted on nonessential imports and of reserving the surplus funds for the purchase of machinery and productive equipment. The attempts of the Central bank to induce importers to invest surplus pesos in dollar deposits at the Central bank were not successful.

Brazil, too, continued its system of multiple rates. Only the "official" rate was fixed by regulation; this was the rate at which exporters were required to deliver 30% of the proceeds of their export to the Bank of Brazil. This exchange was sold exclusively to the government at the rate at which it was acquired. All other transactions were carried out over the free market. The Bank of Brazil, which conducted more than 75% of the business in exchange, maintained the other rate stable for several years.

The exchange rates of the Latin-American countries remained stable, the whole area having enjoyed exchange stability for several years. (The only exception was the increase of the bolívares to 60 per dollar on the curb market, and of the Nicaraguan cordobas to 7.30 per dollar on the curb market in July 1945, as against 5.72 average in 1944.) (See table.)

The chief contributing factor to the stability of the exchange rates was the favourable balance of trade.

The Sterling Bloc.—The area of the sterling bloc remained unchanged during 1945; it included the whole British empire—except Canada and Newfoundland—British mandated territories, British protectorates and protected states, Egypt, the Anglo-Egyptian Sudan, Iraq and the Faroe islands. The organization of the sterling area, consisting of pooling of dollars and other hard currencies, continued. With slight exceptions the income in dollars was converted in sterling, and dollars were allocated according to the needs of the empire. The amount of the war (or abnormal) sterling balances increased further to the total of nearly \$3,500,000,000 (\$14,000,000,000). Of these sterling balances outstanding on June 30, 1945, roughly \$1,070,000,000 were owed to India; \$350,000,000 to Egypt; \$170,000,000 to Eire, \$115,000,000 to Australia; \$110,000,000 to Palestine; \$105,000,000 to Argentina; \$100,000,000 to Malaya; \$63,000,000 to New Zealand and \$27,000,000 to South Africa. A sizable amount was owing to British colonies. These balances could be used without any significant limitations within the sterling area, not, however, for payments outside this area.

The pressure exercised by the owners of the sterling balances to con-

vert part of them into dollars, was growing steadily. This was especially the case after the shipping situation became easier and many of the countries desired to buy various industrial commodities from the U.S.

An agreement with Egypt assured that country of \$40,000,000 for its needs in 1945; similarly, an agreement arranged with Iraq offered that country 3,500,000 Iraqi dinars (= £3,500,000) in dollars for its purchases in 1945. The sterling area was in some respects practically extended by agreements which Great Britain concluded with a number of European countries.

The dollar and gold reserves of Great Britain further increased, especially as a result of the expenditures of U.S. troops in the empire countries. Though no official figures were released, its total was estimated to have reached £450,000,000 (\$1,800,000,000) at the end of Oct. 1945.

The exchange control in Great Britain was further simplified and decentralized. "Registered" accounts in sterling for residents of the U.S. and for residents in Central-American countries were discontinued in July 1945. Sterling on these accounts were freely transferable to any other "America's" account and were convertible in dollars at the official rate of the day.

The registered sterling held on June 30, 1945, were exchangeable into dollars at \$4.02½ only until Sept. 30, 1945, and after that date at the official rate.

The treasury's buying price for gold was increased in June 1945, from 168s. per fine ounce to 172s. 3d. per fine ounce; at the middle dollar rate of \$4.03 it still remained 1s. 5d. under U.S. parity as against previously 5s. 8d. This margin left hardly any scope at all for private arbitrage.

The Anglo-American credit agreement signed in Washington on Dec. 6, 1945, and approved by the British parliament, had great significance for the future exchange and monetary policy of Great Britain. Great Britain was to receive a line of credit of \$3,750,000,000 which might be drawn upon at any time until Dec. 31, 1951. In connection with this agreement Great Britain took on itself the obligation to end practically the dollar pool arrangement of the sterling bloc, not later than one year after the effective date of this credit agreement. Each member of the sterling area was to have its current sterling and dollar receipts at its free disposition for current transactions everywhere, and any discrimination arising from the so-called sterling area dollar pool was to be entirely removed. Furthermore, after the effective date of this agreement, Great Britain was not to apply exchange controls in such a manner as to restrict payments or transfer, in respect to products of the U.S. permitted to be imported into the United Kingdom, or other current transactions between the two countries. Finally the U.S. and the United Kingdom agreed that not later than one year after the effective date of this agreement they would impose no restrictions on payments and transfers for current obligations. This obligation, of course, would not apply to restrictions imposed in conformity with the articles of agreement of the International Monetary Fund.

Continental Europe.—The end of World War II found all countries which had been involved—victorious as well as defeated nations—in a difficult monetary situation. It was clear that there was no possibility of establishing free exchange markets; for months there had been hardly any foreign trade and the paramount task everywhere was that of curbing inflation. Throughout the continent inflation was a major problem closely related to and dependent on the solution of the problems of transport, coal and supplies in general. In most countries a potential inflation had existed during the whole period of war. There was everywhere an excess purchasing power and a growing shortage of commodities of all kinds; and only through a very rigid price and wage control, and through rationing, had it been possible to avoid a great increase in prices. With the end of the war the elaborate system of controls broke down in a number of countries and the danger of galloping inflation became acute. Generally speaking, this danger had been checked more efficiently in western than in eastern Europe.

Already in Nov. 1944 Belgium took measures which aimed at checking inflation by withdrawing from circulation a substantial part of notes and by blocking at the same time all deposit accounts. Similar measures were taken by the Netherlands, Denmark, Norway, Czechoslovakia and Austria. In these countries the circulation was radically cut and the use of all deposits controlled or put practically under rationing. Through all these restrictions a great part of the existing purchasing power was frozen and prevented from appearing as demand on a market with a very low supply of goods. It was clear, however, that these measures would not be able to help avoiding a further increase in prices if an early revival of production did not strengthen the supply of goods.

All attempts to stop the galloping inflation in Greece failed in spite of new measures being taken continuously. Also in Hungary (\$1 U.S. = 30,000 pö) and Rumania galloping inflation broke out; very unsettled monetary conditions existed in Bulgaria and Poland. There was no dealing in foreign exchange in Germany; even between the four occupation zones foreign trade remained practically limited to barter. One U.S. dollar was put equal to 10 German marks, of course only for use by the occupation authorities.

In Italy inflation continued and a further devaluation of the lira was expected and considered necessary. After Dec. 25, 1945, all foreign trading was done at the rate of 225 lire to the dollar instead of 100 lire to the dollar. The question of finding the appropriate exchange rate was expected to become important especially when the International Monetary Fund would begin to operate. France, which maintained what was generally considered an undervalued rate of its currency, devalued on Dec. 23, 1945, introducing the rate of 119 francs to one U.S. dollar instead of the previous 50 to 1. Finland devalued in August from 196 Finnish marks to 1 to 485 to 1.

The clearing payment agreements arranged between Great Britain and several European countries proved to be helpful in promoting trade and also as a stabilizing factor on the exchange markets. The first such agreement was signed with Belgium in Oct. 1944, the rate of 176.5 Belgian francs to the pound being used as basis for current transactions. Each government granted to the other overdraft facilities to the amount of £5,000,000; the balances over this amount to be settled in gold at a price to be determined in each case separately.

The Anglo-Swedish monetary agreement was signed in March. The rate of exchange between the currencies of the two countries was fixed at

16.90 Kr. to the pound sterling. Sweden could use its sterling holdings to finance imports from all members of the sterling area while no overdraft facilities were stated in the agreement. At the time of the agreement Sweden envisaged a maximum transitional accumulation of about £40,000,000 over a period of about two years. The first six months of the agreement showed that there was by far greater need of Swedish imports to Great Britain than Britain's existing possibility of supplying goods needed in Sweden.

The Anglo-Danish monetary agreement was signed in Aug. 1945. It followed closely the pattern of the agreement reached with Sweden. The rate was fixed at 19.34 Kr. to the pound, only a fraction above the pre-invasion level. The Anglo-Norwegian monetary pact was concluded in Nov. 1945, following also the same pattern as the pact with Denmark. The rate was fixed at 20 Kr. to one pound.

The Anglo-Dutch monetary agreement was signed in Nov. 1945, fixing the rate at 10.691 guilder to the pound. The agreement did not apply at the time to the Netherlands Indies. As in the Belgian agreement, each central bank agreed to make its currency available against payment in the other's currency; if the resulting holding reached £5,000,000, additional sales were to be paid in gold.

A similar agreement was concluded in Nov. 1945 with Czechoslovakia, fixing the rate at 201.50 Kč. to one pound. The overdraft facilities were limited to £1,000,000 or to 200,000,000 Kč.

The Anglo-French financial agreement signed in March 1945, while settling a number of outstanding financial problems originated in war, arranged also a payment organization in order to facilitate the resumption of economic intercourse between the sterling and the franc areas. Great Britain was to open a credit of £100,000,000 to France and France a credit of 20,000,000,000 francs to Great Britain—the rate at that time was fixed at 200 francs to the pound. By the end of October the credit of £100,000,000 for French purchases in the sterling area was exhausted, and there were complaints on the British side that the trade between the two countries had been almost a one-way traffic. French purchases stood to British purchases in the ratio of about 10 to 1. France tightened up its exchange control and required especially that private holdings of foreign exchange be surrendered to the French authorities. Great Britain in its agreement with France promised to disclose to the French authorities private French accounts held in Great Britain.

The technical monetary position of the neutral countries remained strong. All of them showed a further increase of their monetary reserve. The Swiss National bank had gold holdings amounting to \$1,111,000,000 (Oct. 1945); the Bank of Sweden \$475,000,000 (Oct. 1945); the Bank of Spain \$109,000,000 (Aug. 1945); and the Bank of Portugal \$60,000,000 (Sept. 1945). In addition to this, all these countries held substantial dollar and sterling balances. Sweden and Switzerland granted reconstruction credits to western European nations.

The Near East.—In the near east the decline of military expenditures of the U.S. and British governments, resulting from the cessation of hostilities in this area, eased somewhat the inflationary pressure. Yet the existing purchasing power and demand for goods still exceeded in most of these countries the supply of commodities and, therefore, the trend toward higher prices was not stopped. Moreover, gold continued to be sought as storage of value.

The open market price for gold in Alexandria slumped violently when Germany collapsed. This decline carried the Egyptian price down from 184 piastres per dirhem at the end of April to 162 piastres on May 10. Shortly afterward, however, the price went up to 186 piastres, equivalent to roughly £19 per ounce, and reached 193 piastres (£19 10s.) in August. Of course these gold transactions were more spectacular than large and the premia quoted on gold compared with exchange parities were not true indices of the value of the middle east currencies. Yet when price levels had been multiplied from three to six times it would be very difficult eventually to avoid a devaluation.

In Iran foreign exchange control was tightened in the fall of 1945. The sale of dollars at the official rate of 32½ rials to the U.S. dollar was virtually suspended in June, and the rate on the free market reached 65 rials in October. The great dollar shortage was explained by gold purchases in the U.S. and by the purchase of U.S. surplus military supplies in Iran.

The U.S. treasury terminated in April 1945 its participation in the program of selling gold in India, which subsequently had been extended to Egypt and Iran. This program had been initiated in Aug. 1943 by the British treasury for the double purpose of combating inflation and of obtaining local currency for military expenditures in India, Egypt and Iran. The U.S. treasury participation was ended in April because the military needs for the currencies of these countries had been completely met by that time.

The price of gold in Bombay quoted Dec. 12, 1945, Rs. 81¼ per fine tolas as compared with Rs. 74⅞ on March 1. After the end of the Japanese war the price dropped to Rs. 63¼ but recovered very quickly.

China.—The end of the war increased rather than eased the monetary chaos in China. The index of the wholesale prices of domestic commodities in Chungking had reached in the spring of 1945 the astronomical figure of more than 1,200 times the 1937 level (in August, 1,900 times). The increase of wholesale prices was checked in December in the expectation of the early arrival of fresh stock.

The exchange shop buying rate for dollars, toward the end of November, was \$1.290, and previous quotations were even higher. Gold which at the beginning of August was quoted between CN \$180,000–190,000 (CN = Chinese national currency) per tael dropped toward the end of August to CN \$115,000.

Exchange control was put in force for some export commodities to assure the surrendering of foreign exchange proceeds of such exports to the government. (See also GOLD.)

## Exchange Stabilization Funds.

As in 1944, exchange stabilization funds were relatively inactive in 1945. In most Latin-American countries the available exchange holdings limited the need for a direct intervention to support the stability of currencies. The liberated countries in Europe had not reached such a stage in their monetary reconstruction that creation of stabilization funds would be advisable.

It seemed obvious that under these circumstances the role of the United States Exchange Stabilization fund in controlling foreign exchange values was not very important. Through the renewal of expiring stabilization agreements and through operations conducted under the existing agreements, the policy of co-operating with friendly foreign governments in the stabilization of their currencies was continued.

Under an existing stabilization agreement between the United States and Brazil originally entered into on July 15, 1937, for a five-year period and later extended to July 15, 1947, the United States Stabilization fund undertook to purchase Brazilian cruzeiros to an amount of \$100,000,000 for the purpose of stabilizing the United States dollar-Brazilian cruzeiro exchange rate. In addition the U.S. government undertook to sell gold to the government of Brazil up to a total amount of \$300,000,000.

On Oct. 9, 1944, the stabilization agreement of March 1, 1942, between the United States and Ecuador was extended, as of June 30, 1944, to June 30, 1945. Under this agreement the U.S. Stabilization fund undertook to purchase up to \$5,000,000 of Ecuadoran sucres for the purpose of stabilizing the United States dollar-Ecuadoran sucre exchange rate. Provision for renewal of this agreement had not been made by the close of fiscal year 1945.

On June 13, 1945, the stabilization agreement of Nov. 1, 1941, between the United States and Mexico was extended for two years to June 30, 1947. Under this agreement the U.S. Stabilization fund undertook to purchase Mexican pesos up to an amount of \$40,000,000 for the purpose of stabilizing the United States dollar-Mexican peso exchange rate.

Also on June 13, 1945, the gold sale agreement of July 6, 1942, between the United States and Cuba, under which the government of the United States undertook to sell gold to the government of Cuba from time to time with payment to be made in dollars within 120 days from the date of the sale of the gold, was extended for four years to June 30, 1949. Under this agreement the unpaid-for amount was not at any time to exceed \$5,000,000.

Throughout the period from Jan. 1944 through June 30, 1945, the stabilization fund co-operated in arrangements whereby Swiss francs were made available for governmental and humanitarian purposes. Thus undesirable disturbances in the United States dollar-Swiss franc rate were avoided.

The total foreign exchange holdings of the fund went up from \$3,200,000 on June 30, 1944, to \$19,080,000 on June 30, 1945. There was a substantial increase of Swiss francs from \$107,594 to \$4,439,237 and the nonspecified foreign exchange increased from \$2,400,000 to \$14,590,000.

On Feb. 15, 1945, identical bills designated as S.540 and H.R.2211 were introduced in the senate and the house of representatives, respectively, to provide for the participation of the U.S. in the International Monetary fund and the International Bank for Reconstruction and Development. The bill, called "Bretton Woods Agreement act," was passed by the senate and the house of representatives. By this bill the secretary of the treasury was directed to use \$1,800,000,000 of the Exchange Stabilization fund to pay part of the subscription of the United States to the International Monetary fund. ## Export-Import Bank of Washington.

Created in 1934, the bank was made a permanent, independent agency of the United States government by the Export-Import Bank act of 1945, approved July 31, 1945. The purpose of the bank is to aid in the financing and facilitating of exports and imports and the exchange of commodities between the United States and foreign countries. All of the operations of the bank are related to this fundamental purpose.

The act of 1945 vested the management of the bank in a board of directors consisting of the secretary of state and four full-time directors appointed by the president of the United States by and with the advice and consent of the senate. It also authorized an increase in the limit on outstanding loans and guaranties from \$700,000,000 to \$3,500,000,000 and removed the prohibition on loans by the bank to governments in default on their obligations to the United States government.

In addition to its reconstruction loans, the bank continued to finance foreign trade of the United States in two other principal ways. It finances specific export and import transactions on application of United States exporters and importers where the nature of the risk involved is such that private credit cannot be obtained. It also makes long-term loans to assist in financing the export of United States materials and equipment required for development projects in foreign countries.

"AS THE REST OF THE WORLD SEES US" by Coffman of the Ft. Worth Star-Telegram. Export-Import bank loans were the only alternative to cash payments open to foreign purchasers of U.S. goods after the termination of lend-lease on Aug. 21, 1945

The total amount of loans authorized by the bank from the time of its establishment in 1934 increased from approximately \$1,200,000,000 at the end of 1944 to more than \$2,300,000,000 at the end of 1945. Disbursements during 1945 were approximately \$80,000,000, and repayments were approximately \$52,000,000. As a consequence, the outstanding loans of the Bank increased from \$224,000,000 at the end of 1944 to \$252,000,000 at the end of 1945. (W. C. Tr.)

**Exports:** see AGRICULTURE; INTERNATIONAL TRADE; TARIFFS. See also under various countries.

**Eye, Diseases of.** **Trachoma.**—Only two theories of the aetiology of trachoma were generally accepted in 1945, the virus theory and the Rickettsial theory. These two theories are not mutually incompatible, but can be reconciled. The conflict is indeed one of nomenclature rather than of fact and largely depends on what we choose to call a Rickettsia and what we choose to call a virus. The evidence so far accumulated leads to the conclusion that trachoma is a specific infectious disease, not caused by any cultivable bacterium, but due to a filter passing agent which is almost certainly identical with the elementary and initial bodies found in the inclusion bodies (Prowazek-Halberstaedter inclusion).

It was doubted in 1945, that trachoma is a specific infectious disease. No cultivable bacterium was shown to produce trachoma when experimentally inoculated into man. The disease can be transmitted to healthy eyes of animals and man only by direct inoculation of material from a case of active trachoma. This material contains an agent that has some of the staining characteristics of both virus and Rickettsia, but not all of either. Hence it would appear that it stands in an intermediary position between the large viruses and the Rickettsia and may possibly form a biological link between them.

**Dibutoline Sulfate.**—A new class of synthetic drugs to produce mydriasis for fundusoscopic examination and cycloplegia for refraction of the eye was described and was undergoing experimental tests. The new drug replaces atropine and scopolamine and in some ways has qualities superior to them. The new mydriatic and cycloplegic drugs are surface active carbamic acid esters of the choline type and, therefore, are chemically unrelated to atropine.

Dibutoline sulfate (dibutylcarbamate of dimethylethyl-B-hydroxyethyl ammonium sulfate) occurs as white crystal which dissolves in water. A 5% solution in distilled water is nearly neutral (pH 6.5) but repeated instillations produce temporary congestion of the eye. It was used in 1945 in cases where atropine was contraindicated.

**Quantitative Test for Measurement of the Degree of Red-Green Colour Deficiency.**—The types of colour vision tests needed for the classification of personnel of the army air forces were (1) a simple, rapid and reliable screening test which would distinguish the normal from the colour deficient person, and (2) a supplementary quantitative test which would classify the colour deficient subjects as to the degree of the defect and would be of aid in determining whether the applicant was competent to make the colour discriminations required in his particular job. A threshold lantern was devised for use as a supplementary test. It uses eight test colours chosen so as to approximate the limiting standards for aviation colours. Tests involved the identification of red, green and white signals from a traffic control projector and the recognition of coloured pyrotechnic signals fired from a plane. When the results of the field tests were compared with scores on several colour vision tests giving quantitative scores, it was found that the threshold lantern provided the least indication of success or failure in the

field tests.

**Prosthesis of the Eye in Synthetic Resin.**—As a result of research conducted by the medical ophthalmologists of the U.S. army, a new method of fabrication of artificial eyes was developed by dental officers working with ophthalmologists in the service hospitals. Eye replacements made of blown glass with coloured parts added by hand painting or conventional iris disks were not available in sufficient quantities nor of satisfactory quality during World War II. Furthermore, glass restorations are fragile, may explode within the socket. The surface glaze of glass is not permanent and etching often occurs. Restorations of a more durable substance were urgently required, which could be made as natural or more natural in appearance than those of glass.

The basic synthetic resin, methyl methacrylate, is easily obtained, being a standard item used in the production of acrylic teeth. It lends itself well to moulding, colouring and adjustment of size and shape after initial completion.

## Fair Employment Practice, Committee On.

Under authority of executive orders 8802 of June 25, 1941, and 9346 of May 27, 1943, this committee, established by President Roosevelt, continued to process cases of discrimination because of race, creed, colour or national origin in war industries and government employment. During the fiscal year 1944-45, the committee docketed a total of 3,485 cases and 3,173 were closed, 1,191 cases being settled as satisfactory adjustments while the remainder were disposed of because of lack of jurisdiction, lack of merit, insufficient evidence and withdrawal by complainant. The pending case load as of July 1, 1945, was 2,428. In this same period the committee held 15 public hearings. Its staff numbered 128 persons by March 1945, 54 being assigned to the 15 regional and subregional offices located in major industrial centres and the remainder to the national office in Washington. Two committee members resigned for reasons of health and were replaced by presidential appointments. In June 1945, the committee published its "First Report," which covered its activities for the 18 months' period between July 1943 and Dec. 1944.

The National War Agencies Appropriation act, 1946, approved by congress on July 17, 1945, included a \$250,000 appropriation for the Committee on Fair Employment Practice. The act provided that this sum be used "for completely terminating the functions and duties of the committee . . ." and provided further "That if and until the committee . . . is continued by an act of congress, the amount named . . . may be used for its continued operation until an additional appropriation shall have been provided."

The occurrence of V-J day less than a month later, followed by the wholesale cancellation of war contracts, raised questions concerning the committee's jurisdiction over private industry reconverting to peacetime production. The committee immediately sought clarification of its responsibilities in industrial reconversion while holding that its authority to eliminate discrimination in government employment and in the performance of government contracts remained unimpaired.

On Dec. 20, 1945, President Truman issued executive order 9664, continuing the committee's work under "the duties and

responsibilities" of the previous executive orders and "for the period and subject to the conditions" stated in its appropriation. In addition, the committee was empowered to "investigate, make findings and recommendations, and report to the president with respect to discrimination in industries engaged in work contributing to the production of military supplies or to the effective transition to a peacetime economy."

To accomplish these new duties, the committee planned a series of investigations, including public hearings, preparatory to advising the president concerning the status of minority workers in the reconversion period.

The committee's decreased appropriation necessitated two cuts in staff, one in Aug. and another in Dec. 1945, when the total personnel numbered 31. In addition, as of that date, all field offices except those in Detroit, Chicago and St. Louis had been closed.

**Falkland Islands:** *see* BRITISH EMPIRE.

**Famines.** The world-wide drive for larger food production, particularly in the thickly populated areas of India and China, combined with the better organization for relief prevented any widespread famines in 1945. The general drought in the southern hemisphere and through the Mediterranean area reduced production in some areas but sufficient supplies were available to prevent starvation. The fatal scarcity of food occurred in the cities of Europe where the devastation of the war had destroyed storehouses and stocks, transportation facilities and otherwise so impoverished the people as to bring them to the low rations that resulted in a high death rate from malnutrition.

In China there was one area of serious drought losses in Shensi, southern Hopei and western Honan. The 1945 wheat crop was very short. While food supplies were short in what was formerly occupied China, the removal of Japanese military forces released some stocks for the natives. Unoccupied China had only enough food to supply the usual population plus those who had migrated from occupied China. The end of hostilities encouraged the maximum planting for the next crop.

India's food situation was not favourable because of the short rice crop in Bengal and Bihar which normally produce 45% of the total crop. Rice imports from Burma were limited by the short crop there. India's problem was becoming more acute because of the annual increase of population by 5,000,000 per year and increased consumption by industrial workers. The requirements for military forces were large in 1945 but expected to be sharply reduced in 1946.

Food supplies for the native populations in southeastern Asia, Indo-China, Malaya and Java were less than prewar normal but generally sufficient to sustain the people, except in limited areas where hostilities had not ended. The use of air transport for emergencies was available during the second half of 1945 and served to relieve distress in many areas. The operations of U.N.R.R.A. also became an important service in critical cases. The plans for the United Nations Food and Agriculture organization, begun at Quebec, Canada, in Oct. 1945, included measures that were designed to put an end to famines of the large scale of past years by forecasting shortages, crop failures, etc. and arranging for the transportation of surpluses to the devastated regions. These plans would come into action following the end of the work of U.N.R.R.A. in 1947 according to 1945 plans.

**Far Eastern Commission:** *see* ALLIED MILITARY GOVERNMENT.

**Farm Co-operatives:** *see* FARM CREDIT ADMINISTRATION.

**Farm Credit:** *see* FARM CREDIT ADMINISTRATION.

**Farm Credit Administration.** Farmers in the United States and their co-operative business associations used \$1,105,599,906 in credit in the year 1945 supplied by the credit units operating under the supervision of the Farm Credit administration.

Financing crop and livestock production accounted for the biggest volume of the loans, amounting to \$617,204,790. The largest amount of this financing was through the nation-wide system of production credit associations. While the number of loans made by the production credit associations in the year decreased compared with the previous year, the volume was \$516,115,670 compared with \$490,476,633 for 1944. The 11 emergency crop and feed loan offices loaned \$16,952,105 to farmers unable to qualify for credit from other sources. The federal intermediate credit banks, besides supplying the bulk of the loan funds for the production credit associations and part of the funds used by the banks for co-operatives, discounted agricultural paper for privately capitalized financing institutions amounting to \$74,490,554, and the Regional Agricultural Credit corporation of Washington, D.C., made loans totalling \$9,646,461.

The 13 banks for co-operatives extended credit totalling \$361,255,040 in 1945 compared with \$391,533,038 in 1944. Decrease in the amount loaned was due largely to many co-operatives having built up their capital and become debt free, and to the lack of demand for loans financing construction or the purchase of equipment.

The 12 federal land banks and the local national farm loan associations handled 41,909 long-term farm mortgage loans totalling \$122,448,397 made for the land banks and the Federal Farm Mortgage corporation. This compared with 38,845 loans and \$105,292,360 in 1944. A change in the law effective July 1, 1945, allowed the land banks to make loans up to 65% of the appraised normal agricultural value of the land instead of 50% of the appraised normal agricultural value of the land plus 20% of the appraised value of the permanent, insured improvements on the land. Repayments on farm mortgage loans continued heavy amounting to \$349,110,210 in the year. Land bank and commissioner loans outstanding on Dec. 31, 1945, totalled \$1,255,984,495.

Further progress was made in returning federal land bank government-owned capital stock and paid-in surplus to the revolving fund in the U.S. treasury. In the year nine federal land banks returned \$74,424,459 to the treasury.

Loans and discounts made by the 12 federal intermediate credit banks in the year totalled \$838,458,909 compared with \$877,607,449 in 1944. Production credit associations accounted for \$663,498,820 of the total; banks for co-operatives, \$96,437,856; privately capitalized financing institutions, \$74,490,554; and loans direct to farmers' co-operatives, \$4,031,679.

Loans to veterans and those remaining in the service were given major attention and accounted for \$2,424,525 in long-term farm mortgage loans and \$5,646,180 in production credit association loans in the year.

(I. W. D.)

**Farm Income:** *see* AGRICULTURE.

**Farm Machinery:** *see* AGRICULTURE.

**Farm Mortgages:** *see* AGRICULTURE; FARM CREDIT ADMINISTRATION.

**Farm Purchase Loans:** *see* FARM SECURITY ADMINISTRATION.

**Farm Security Administration.** More than 310,000 farmers in the United States, including 3,600 World War II veterans, used the supervised agricultural credit services of the Farm Security administration in 1945.

During the year, committees composed of three successful farmers in each county assisted in adapting the program to the wartime needs of local communities. The farmer committees decided whether applicants for federal loan funds would be able with the aid of the local FSA supervisor to improve their farming practices, raise their living standards, and repay their debts. When a loan is made, the committees work with the supervisor to help the borrower utilize his labour and land resources to their fullest extent. They periodically review the progress made by the borrowers and decide whether additional credit and supervision is necessary. In addition, the county committees with the aid of a fourth member, a veteran, had by Oct. 31, 1945 certified 897 applications for agricultural loan guaranties made by veterans under the provisions of the Servicemen's Readjustment act. Three types of farm loans are made by the Farm Security administration:

1. *Operating Loans.*—Short-term loans for equipment, livestock and other farm operating needs are made to low-income farmers who cannot obtain adequate credit from any other source. In the fiscal year 1945, committees certified 24,996 families for new loans and 102,890 borrowers for supplemental loans. More than 78,000 borrowers repaid loans in full.

2. *Farm Ownership Loans.*—Forty-year loans are made to tenant farmers to purchase farms of their own. The county committees determine applicants' eligibility and certify the reasonable value of the farms they plan to buy. In the fiscal year 1945, 1,870 loans were approved, bringing the total number of these loans to 38,000. Eleven hundred families had paid their loans in full and, as of March 31, 1945, the remaining borrowers were 57% ahead of schedule on their repayments.

3. *Water Facilities Loans.*—Loans for farmstead and irrigation water supply were approved for 1,000 families and seven farmers' groups in the 17 western states during fiscal 1945.

World War II veterans shared in all these programs. By Oct. 31, operating loans had been made to 3,497 veterans, farm ownership loans to 145.

For the fiscal year 1946, congress authorized the use of \$67,500,000 for operating loans, \$50,000,000 for farm ownership loans, and \$1,000,000 for water facilities loans. Congress earmarked \$25,000,000 of the farm ownership loans for veterans.

(R. W. Hs.)

**Fascism.** The decline in the fortunes of fascism as a movement of international importance which had set in in 1943 was markedly accelerated in 1945. The total defeat of Germany, Italy and Japan which had formed the core of international fascism had its telling effect, though fascism maintained its grip on Spain and to a lesser degree on Argentina. In Hungary and in Austria the fascist regimes were followed by democratic regimes and free elections were held. The two men who had been outstanding as the leaders of fascism, Benito Mussolini and Adolf Hitler, each ended his life in 1945 in an ignominious way. Prominent fascist leaders were tried in many countries and a number of them were executed.

It was yet too early at the close of 1945 to say whether in the two countries where fascism was most entrenched, in Italy and in Germany, fascism had lost its hold on the public mind. Germany did not survive defeat as an organized nation. Bewilderment and lethargy were too great there to allow any conclusions about the trend of the German mind. In Italy a coalition of parties of the antifascist resistance movement was in power,

THE BODY of Benito Mussolini, executed April 28, 1945, by Italian partisans, lying in the Piazza Loreto, Milan, surrounded by the corpses of those executed with him. Crowds of Milanese were held in check by partisans

but toward the end of the year, in spite of the restoration of civil liberties, an antidemocratic trend made itself felt. It was mainly represented by a paper *L'Uomo Qualunque* (the *Average Man* or the *Common Man*), which was founded by Guglielmo Giannini and gained quickly a very wide circulation.

Though Giannini denied being a fascist, in an interview on Dec. 16, 1945, he used phrases which clearly reflected the general fascist line. He attacked all "professional politicians," including President Roosevelt who, he said, "fooled America for four successive terms." He promised that his movement, the movement of the common man, which, as he hoped, would "spread all over the world," would produce a sufficient number of administrators capable of running Italy. They would remain in office for 20 years and would find the "new word"—the new form of government. He did not blame fascism or Italy or Germany for World War II but "a handful of a hundred politicians throughout the world." He wished to rid the world of these politicians whom he blamed for the death of his son killed in the war. "America, too, has been the victim of professional politicians. Roosevelt brought you into the war and caused many Americans to die. Otherwise the war would have been finished in 1942," apparently with the victory of fascism.

With the victory of the United Nations, fascist parties went out of existence officially all over the European continent with the exception of the Iberian peninsula. In the United States fascist agitation continued on a rather minor scale. The defeat of Japan paved the way for an eradication of fascism in that country and for the progressive introduction of democratic institutions under the guidance of the U.S. occupying forces. In Latin America Argentina remained a centre of fascist agitation. An effort to oust the fascist officers' group failed and by the end of 1945 the position of Argentina's strong man, Colonel Juan D. Perón, seemed sufficiently stable to enable him to put up his candidacy for president. As a result of this situation the relations between the United States and Argentina became more and more strained. (See also ANTI-SEMITISM; ARGENTINA; COMMUNISM; DEMOCRACY; GERMANY; ITALY; JAPAN; RUMANIA; SPAIN.)

(H. Ko.)

**Fashion and Dress.** In 1945 U.S. designers continued to display remarkable ingenuity in working with the limited amounts of fabrics allotted them by

Above: THE CHOLO, a loose-swinging coat copied from a Peruvian shirt, was worn over swim suits in 1945

Above: JERSEYS and belted skirts were popular in 1945 with the younger set

Below: EVENING DRESS with stiff farthingale worn underneath, making a jutting line at the hips, a tiny look at the waist

Right: THE ROUNDED SILHOUETTE, tight only at the throat, wrists and waist, was a new 1945 fashion note

Above: THE CANADIENNE, tight-belted three-quarter length coat worn in the U.S. during 1945, was originated in Paris and adapted from the Canadian soldier's coat

the government. Principal means of avoiding a monotonously skimpy look in clothes was the use of a rounded line. Angles almost completely disappeared from the silhouette; shoulders, hips and arms all were cut on the curve or rounded out by skilful padding.

The trend toward roundness began early in the year with the introduction, via the renascent French *couture*, of the tight, corseted midriff. This, by pulling the waist in snugly, emphasized fullness above and below the beltline. Slowly, then, curves began to predominate in every costume, with tightness occurring only at the neck and the waist and the wrists. Suit jackets had round collars, round-cut hemlines and sleeves that were one swelling curve from the throat to the wrists. Suit skirts belled out in front, giving a stomachy look. Even the little jerseys worn with them had large dolman sleeves, and dresses featured rounded yokes as well as deep-set armholes. The Canadienne, adapted by the French from the coat of the Canadian soldier, appeared in many variations and was probably the year's biggest fashion. Cut to three-quarter length it was swung out from the shoulders, snug at the waist. Other coats hung straight and loose and then were belted tightly into thick folds to achieve bulkiness.

For these coats and suits and dresses, rounded hats came into being. Big globes of felt and crocheted wool completely enveloped the hair, which was swept backward into them, leaving the face and throat and the nape of the neck out in the open. Rollers, the swoop-brimmed hats of the Edwardians, also were abundant.

But it was the evening dresses shown in the fall collections of 1945—and here evening dresses put in their first spectacular appearance after World War II—that went the limit in achieving roundness. Many of them came equipped with farthingales, pillowy little peplums worn underneath to make the hips seem hipper and the waist tinier. Others had tightly boned basques narrowing them into nothing in the middle, billowing the skirt below.

On the beach, the rounded line manifested itself in shorts bloused at the legtops (like bloomers), and shorts cannily cut and moulded along the body lines (like the loincloths worn by South Sea islanders). Breastbands, strips of wool or sharkskin or linen, topped these. Over swimsuits, the *cholo*, one of the outstanding fashions of the year, was worn. This loose-swinging cotton coat, copied from the shirt of Peruvian mountaineers, hung slack and straight from the shoulders to the thighline. Elaborately ruffled versions of it were seen as time went on. In the country, the most popular clothes were big, billowed skirts of calico and gingham, often reaching mid-calf length or longer. These were bound tightly at the waist with sashes and cummerbunds, and worn with mere skimps of bandeaux on top.

In that peculiarly U.S. category of clothes, the "separates," the U.S. designers managed particularly exciting developments. Shirts and skirts became the easy-to-live-in, easy-to-vary uniform of the nation's women, and in 1945 shirts, usually made of wool jersey, were long-sleeved or completely sleeveless, rounded at the neckline or equipped with a turtleneck and otherwise completely simple. These buttoned down the back or zippered at the side. Skirts, formerly knife-straight, showed a definite trend toward puffiness over the stomach and hips in 1945.

A few horseblanket skirts appeared among the college crowd, made of plaid wool horseblankets bound with black braid and fastened with horseblanket buckles. All skirt and shirt combinations were sparked by the use of much brightly polished gold and brass. Gold neckbands, metal rings like those the Zulus wear, were popular, and lengths of gold chain were wound round

and round the neck and wrists. Buttons were invariably brassy, and belts had as much sparkle as a cowboy's Sunday saddle. The belt, in fact, became a vital part of fashion during 1945. It was no longer a strip of cloth that came with a dress, but an important thing in itself, a necessity for every silhouette. Belts were used to bind the waists of skirts, of taffeta evening dresses, of wool swimsuits and even fur coats. Manufacturers, as a result, turned out more varieties of belts and more beautiful ones than had ever been seen before. Some were wide burnished bands of leather like razor strops. Others were ingeniously shaped to fit the waistline, curving down in back and giving a round look to the hips. Almost all were plastered with handsome old emblems and insignia of brass, with brass rings and fastenings, and they often dangled little pouches that held make-up and keys or, for a whimsy, flowers.

The news on women's feet were ballet slippers. These, in plaids and brilliant colours as well as solid black, were seen everywhere with skirts, with dresses or with dancing master tights. As a rule, the flat and near-flat shoes outdistanced high heels in popularity all during 1945. Chief among these were low-slung suede sandals, thin little leather slippers and soft ankle-high boots which fitted the feet as gloves fit the hands.

Women's hair showed the shape of women's heads in 1945. The hair was scraped up into topknots, swept back into Psyche knots or into little knots at the nape of the neck. Ribbons and bands of metal were wound round these hairdos, or little clusters of flowers were pinned on top and dangled streamers of ribbon down the back. Headcoverings, besides the global hats and rollers already mentioned, included hoods and helmets. These ranged from skulltight ones of wool jersey to sumptuous ones of fur.

Toward the end of 1945, and it must be noted here, clothes took on a relaxed, peacetime air. Prettiness became fashionable and possible, with the end of the war; practicality was slightly stepped down. Elegant little satin suits that would have had no place in a 1945 wardrobe came into being. So did luxurious brocaded coats and stylized evening dresses stiff with jet embroidery. From Paris came pretty bonnets modelled on the hats of the Directoire era and made lush with flowers and ribbon. Paris too was responsible for a slow but decided interest in extremely feminine, bosomy fashions, blouses slashed low at the neck and dresses stitched for accentuation at the bustline. (See also FURS.)

- FBI: see FEDERAL BUREAU OF INVESTIGATION.
- FCA: see FARM CREDIT ADMINISTRATION.
- FCC: see FEDERAL COMMUNICATIONS COMMISSION.
- FDIC: see FEDERAL DEPOSIT INSURANCE CORPORATION.

**Federal Bureau of Investigation.** During World War II while there was a concentration of energy upon espionage, sabotage and related matters, the FBI gave constant attention to general criminal violations. This was true in the fiscal year 1945, when there were 13,813 convictions in cases investigated by the FBI, with sentences totalling 31,962 years, 4 months and 6 days, one death and six life sentences. Fines, savings and recoveries amounted to \$16,534,436.21.

A total of 8,955 fugitives were located in FBI investigations and 7,892 automobiles were recovered. Investigations resulted in the conviction of 96.9% of the persons brought to trial. During the fiscal year, 9,522 fugitives were located for other law enforcement agencies through the identification of fingerprints in the FBI identification division.

The national defense investigations of the FBI were vigor-

ously pursued during the war, with the result that there were no cases of enemy-directed sabotage, and espionage efforts of the enemy were made ineffective.

**Selective Training and Service Act.**—During the fiscal year 1945, the location and apprehension of Selective Service fugitives continued to be given preferred attention. The FBI and co-operating law enforcement agencies took into custody 5,090 such fugitives.

During the year 3,093 convictions resulted from Selective Service charges, but the major emphasis in the enforcement of this act was in making men available to the armed forces. Under this program prosecutions were undertaken only in those cases which evidenced a wilful violation of the law. During the war there were no "slacker raids" or indiscriminate challenging of draft-age men which might have led to inconveniences for law abiding citizens or hysteria.

**Espionage.**—While the effectiveness of counter-espionage programs cannot be evaluated in terms of persons convicted for that violation but rather through the lack of accomplishments of foreign spy organizations, ten convictions resulted in federal courts under this classification in the fiscal year 1945. Sentences totalled 89½ years. There were two life imprisonments, five fugitives were apprehended and recoveries amounting to \$106,853 were realized. There were two prosecutions for violations of the censorship statutes, resulting in one ten-year prison sentence and fines of \$10,050.

Approximately 700 cases were investigated under the Foreign Agents Registration act and in addition to forced compliance with provisions of the statute, 13 persons or corporations were convicted of violations.

**Sabotage.**—As in previous years, investigations of reported acts of sabotage showed persons responsible were not motivated by a desire to obstruct the war effort but were prompted generally by personal reasons such as jealousy, anger or a desire for revenge. Investigations were conducted of 3,081 reported acts of sabotage during the fiscal year. Of the cases resulting in prosecution, there were 45 convictions in federal courts with sentences totalling more than 146 years.

**Treason.**—There were no convictions for treason during 1945, but there were two for misprision of treason, resulting in sentences of five years each. In addition, three women were convicted under the General Conspiracy statute for giving aid and comfort to German prisoners of war who had escaped from internment camps in this country. Sentences totalling five years and four months and fines aggregating \$3,000 resulted from these three convictions.

**Escaped Prisoners of War.**—During the fiscal year 1945, a total of 1,607 prisoners of war were reported to the FBI as having escaped. Of this number, only 22 were still at large on June 30, 1945.

**Servicemen's Dependents Allowance Act of 1942.**—This act provides for the prosecution of women who illegally marry servicemen to receive allotment checks from the government. During the year, 215 convictions resulted from investigations under the act.

**War Frauds.**—Investigations dealing with frauds against the government continued to increase steadily during 1945. A total of 2,204 reports of fraud were received, of which 1,538 warranted investigation. From the cases investigated, 334 convictions resulted, with fines, recoveries and savings amounting to \$3,926,244 and sentences totalling 450 years, 7 months and 27 days.

**Kidnapping.**—During the fiscal year 1945, 18 kidnappings occurred, none of which involved a demand for ransom and all of which were solved. There were 34 convictions. From the enactment of the Federal Kidnapping statute on June 22, 1932,

to the close of the 1945 fiscal year, 279 kidnapping cases were investigated by the FBI and 277 of these were solved. The two remaining unsolved cases were under active investigation.

**Hijacking.**—Violations of the Theft From Interstate Shipment statute often involve hijacking and related criminal activity. Investigations by the FBI again reflected a substantial increase in this type of violation. A contributing factor undoubtedly was the continued scarcity of many consumer commodities. During 1945, there were 1,426 convictions, more than twice the number during the 1944 fiscal year.

**Bank Robberies.**—There was a slight increase in the number of bank robberies in the fiscal year 1945 over the preceding year of 1944. A total of 53 convictions were handed down in federal courts for bank robbery, larceny and burglary during the fiscal year. Two bank robbers were killed while resisting arrest.

**Illegal Wearing of the Uniform.**—Violations in this category increased 40% during 1945 over the fiscal year 1944. There were 974 convictions, with sentences of more than 992 years and fines of \$12,430.

**National Motor Vehicle Theft Act.**—Even though use of automobiles declined during the war, more automobiles were recovered in cases investigated by the FBI in the fiscal year 1945 than in the preceding fiscal year. A total of 7,892 stolen motor vehicles valued at \$6,402,439 were recovered. Convictions resulting from these investigations totalled 2,418.

**White Slave Traffic Act.**—Investigations under the White Slave Traffic act resulted in 338 convictions, with sentences totalling 1,048 years, 2 months and 18 days in the fiscal year 1945.

**Extortion.**—Investigation of violations of the Federal Extortion statute resulted in 62 convictions with sentences of more than 192 years and fines amounting to \$2,435. Investigative efforts of the FBI resulted in the recovery of \$6,144 of extorted money.

**Federal Reserve Act.**—During the year, 219 cases of alleged defalcations involving \$2,269,000 were reported to the FBI. The investigations resulted in the return to the banks of \$483,127. The FBI conducted investigations relative to embezzlements and related offenses by employees or officials of banks which resulted in 139 convictions.

**FBI Laboratory.**—During the fiscal year 1945, 136,098 examinations were made in the FBI laboratory involving 194,445 pieces of evidence. The volume of examinations conducted for state and municipal law enforcement agencies rose to 2,414 cases, an increase of 53.8% over the fiscal year 1944. In addition, 745 examinations were made for other federal agencies.

**Identification Division.**—In the fiscal year 1945, 7,480,249 fingerprint cards were received and retained by the identification division of the FBI.

An important function of the identification division is the war casualty file, the purpose of which is to identify unknown deceased casualty fingerprints in co-operation with the casualty branch, adjutant general's office, war department. As of June 30, 1945, this file contained 163,500 fingerprints. A total of 829 requests were received from the war department and 531 identifications were effected.

Identifications effected in the fiscal year 1945 on arrest fingerprint cards totalled 690,593 or approximately 70%. At the close of the fiscal year 1945, the identification division had a total of 97,497,563 fingerprint cards in its files.

Forty-five foreign countries and territorial possessions of the United States co-operated in the international exchange of fingerprints during the fiscal year 1945.

On June 30, 1945, the single fingerprint section of the identification division contained approximately 140,660 single fingerprints, representing the records of 14,066 criminals. These records were selected for special handling because the persons

The time of \$1,200 at the imately 000,000 increase at the

represented were believed to be outstanding gangsters, extortionists, kidnappers, bank robbers or fraudulent check writers.

**Uniform Crime Reporting.**—At the request of the International Association of Chiefs of Police and pursuant to an act of congress, the FBI from Sept. 1930 has acted as a central clearinghouse for police statistics on a nationwide basis. The reports of various law enforcement agencies are summarized and published in the *Uniform Crime Reports* bulletin which is published semiannually. The bulletin furnishes interested officials a yardstick with which to evaluate the extent and fluctuation of crime in individual communities.

**Juvenile Delinquency.**—Among the 488,979 arrest records received at the FBI in the calendar year 1944, age 17 was the predominating single age group among arrested persons and was followed by ages 18, 19, 21 and 22 in the order listed. The arrest records reflected, however, a decrease of 5.2% in the arrests of persons in the 18 to 20 age group, while arrests of persons less than 18 years old declined 2.5%.

Despite this decrease in the arrests of youths in 1944 as compared with 1943, a comparison of the 1944 data with the figures for 1941, the last peacetime year, shows a decided increase. Arrests of boys under 18 were 18.8% greater in 1944 than in 1941. Arrests of girls under 21 showed a 134% rise, indicating there was still an abnormally high level of juvenile delinquency. (See also CHILD WELFARE; CRIME; KIDNAPPING; POLICE; SECRET SERVICE, U.S.) (J. E. H.)

Federal Communications Commission.

The continuation of measures in the United States to speed the victory, preparation for reconversion of communications from war to peace and negotiations for common carrier rate reductions were the outstanding activities of the Federal Communications commission during the calendar year of 1945.

After the Japanese surrender, the Radio Intelligence division shifted its emphasis from the watch for espionage transmissions to surveillance for other illicit use of or interference with the radio channels, but continued locating and furnishing directions to lost planes, a service developed in response to wartime demands. The Foreign Broadcast Intelligence service which had monitored foreign broadcasts for various government agencies from 1941 was transferred at the end of the year to the war department.

Various restrictions on construction in the broadcasting and common carrier fields were removed after the war. Amateurs were permitted to resume operation in certain bands on Nov. 15.

Radio operation which before World War II had been confined below 300 megacycles was projected by wartime technical progress far into the higher frequencies for military purposes. To enable nongovernment users to expand into this area, the commission, after extensive hearings, issued an allocation pattern from 25 mc. to 30,000 mc. Commercial television was allocated channels below 300 mc., while the 480-920 mc. band was allocated for experimentation with wide-channel colour television. Frequency modulation (FM) broadcasting was provided for between 88 and 108 mc. The 88-92 mc. band was allocated to noncommercial educational broadcasting, the 92-108 band to commercial broadcasting. It was estimated that at least 5,000 FM stations could be licensed in these bands. Before the end of the year, the commission took the last steps needed to establish these services by issuing rules and regulations, standards of good engineering practice and plans allocating the channels over the U.S. At the end of the year, there were 150 applications for television permits, 800 for FM.

The upward extension of allocations also permitted the creation of a number of new services and expansion of many pre-

viously operating Re-allocation of frequencies below 25 mc. issued in proposed form had not been final at the end of the year.

The number of standard broadcasting stations rose during the year to 939. In addition, construction permits had been issued for 65 and there were 520 applications for new stations on file.

Annual savings of \$41,000,000 to patrons of interstate telephone service resulted during the year from negotiations between the commission and the American Telephone and Telegraph company. Other reductions were achieved in international radio and cable rates, some of them as the result of agreements between the United States and the British commonwealth at a tele-communications conference at Bermuda. The U.S. was also granted the privilege of establishing direct circuits on a permanent basis to certain British points. (See also RADIO; WAR COMMUNICATIONS, BOARD OF.) (P. A. P.)

Federal Council of the Churches of Christ in America.

In 1945 the council in the U.S. consisted of 25 national denominations, including most of the major Protestant bodies and three of the Eastern Orthodox group, and representing approximately 28,000,000 members in 140,000 local congregations.

While continuing to lead in the religious ministry to men and women in the armed forces, the council gave major attention in this year of transition from war to peace to problems of world order. It held a national study conference of leaders of the churches in Jan. 1945 to devise a program whereby the churches might strengthen the movement for world order. Amendments were suggested to the Dumbarton Oaks proposals and an extensive educational program was undertaken in preparation for the San Francisco conference. The council was represented among the consultants at the San Francisco conference and was, along with other religious groups, influential in achieving the inclusion of provisions for furthering human rights and fundamental freedoms in the charter adopted for the United Nations organization.

During the year plans were matured for a comprehensive relief and reconstruction program through the churches in the neediest territories of Asia and Europe. Rev. Samuel McCrea Cavert, general secretary of the council, was loaned to the World Council of Churches to work with its headquarters office in Geneva, Switzerland, in the development of the program of the World Council, notably in the field of reconstruction and relief in Europe.

The year marked the resumption of closer relation with the churches of other lands, including Japan, to which a deputation was sent in September (in co-operation with the Foreign Missions conference of North America), and Germany, to which a deputation was sent in November.

The council represented the interest of its constituent churches in impressing upon the public and upon responsible officers of the government the great urgency of moral and spiritual disciplines in the new atomic age. In the light of these obvious needs the council increased its program of evangelism on a community-wide basis through home visitation evangelism and over the radio, where it has co-operated with the national networks in presenting the challenge and the inspiration of religion.

In the field of race tensions the council developed race relations clinics in numerous cities, bringing together, under the initiative and auspices of the churches, the institutional and professional resources of the community to diagnose the causes of tension and to formulate plans for improving the community health.

The usual programs were enlarged in such fields as worship, home and family life, religion and health, industrial relations, and research and education.

The *Federal Council Bulletin* (monthly), *Information Service* (weekly), *Interracial News Service* (bi-monthly) and *Town and Country Church* (monthly) give current information about the work of the Council.

(Ro. P. B.)

## Federal Deposit Insurance Corporation.

During the year 1945 no bank depositor in the United States experienced a loss from a bank failure. The number of banks which fail is always relatively small when bank assets are increasing rapidly and the national income is high. However, 1945 was the first calendar year during which not a single bank failed. The Federal Deposit Insurance corporation purchased assets of a character not suited for bank investment from one bank, in order to permit its merger with another bank. The loss from this operation would be small.

The liquidation of assets acquired by FDIC through bank suspensions and mergers progressed satisfactorily during 1945. Of the \$260,000,000 disbursed in the 12 years of insurance operations to protect depositors in 398 banks with about \$500,000,000 of deposits, more than \$210,000,000 had been recovered by the corporation by the close of the year. Actual losses in terminated cases amounted to about \$10,000,000 and reserves of \$20,000,000 were held to cover additional losses. The total assets of FDIC at the close of the year amounted to \$932,000,000 including U.S. government obligations of \$900,000,000.

On Dec. 31, 1945, 13,500 insured commercial and mutual savings banks held total assets of about \$165,000,000,000 and total deposits of \$155,000,000,000. The increase in assets of these banks of \$21,000,000,000 during the year was chiefly in U.S. government obligations. Capital of insured banks increased more rapidly than in previous years, but not as rapidly as deposits. The total dollar amount of earnings was larger than in any previous year, but the rate of earnings on assets continued to decline.

The corporation continued the examination and supervision of the 3,800 federal credit unions—a responsibility which was first transferred to the FDIC from the Farm Credit administration by the president in 1942 until Title I of the First War Powers act.

Leo T. Crowley, who had served as chairman of the board of directors of FDIC from Feb. 1934, resigned effective Oct. 15. Maple T. Harl, state bank commissioner of Colorado, was appointed chairman but did not take the oath of office until Jan. 5, 1946. The other directors were: Phillips Lee Goldsborough whose appointment for another term of six years was approved in September, and Preston Delano, comptroller of the currency. (See also BANKING.)

## Federal Power Commission.

More than \$1,000,000,000 was eliminated from the plant accounts of electric utilities in the U.S. under the requirement that utility properties be recorded on the basis of their original cost. By the end of 1945, 126 companies had disposed of reclassification and cost adjustments aggregating \$1,014,590,000. Elimination of write-ups and other inflationary items and cost accounting resulted in an overall strengthening of the electric utility industry, the commission contends, a seven-year

survey showing increases of 82% in kilowatt-hour sales, 24% in generating capacity, 17% in number of customers and 44% in electric revenues accompanied by an increase of only 7% in plant investment. Depreciation reserves were increased nearly 90%, more than \$1,300,000,000. More than \$3,000,000,000 retained out of revenues was invested in property additions and replacements or utilized to retire outstanding securities.

Electric power produced for public use in 1945 was estimated at 222,367,000,000 kw.hr., a decline of only 2.6% from the 1944 all-time high of 228,188,844,000 kw.hr. Industries and railways produced for their own use 48,521,000,000 kw.hr., 5.5% less than the previous year, making a total 1945 production estimated at 270,888,000,000 kw.hr. Industrial demand declined sharply after V-E day, following the cancellation of war contracts; but residential and commercial consumption increased as plants were reconverted to peacetime production. Nearly 800,000 customers were added during the year, bringing the total to about 34,000,000. Generating capacity of plants in utility service mounted toward the 50,000,000-kilowatts mark, as the total reported Oct. 31 was 49,901,280 kw. with further additions scheduled for service before the year's end. Industrial plant capacity was 12,763,732 kw., which, added to utility plants, made a total generating capacity of more than 62,000,000 kw.

Instituting a broad investigation of the entire natural gas industry, the commission heard state officials, gas producers, pipeline executives and engineers in Kansas City, Oklahoma City and New Orleans, with further hearings scheduled in Houston, Tex.; Biloxi, Miss.; Charleston, W.Va., and Chicago. Pipe-line capacity was largely increased to meet urgent demands in the Appalachian and middle west industrial areas. Construction of three major pipe lines, involving \$210,000,000, was proposed, including the \$70,000,000 Michigan-Wisconsin line from the Hugoton field to Detroit and Milwaukee, 1,216 mi.; a line from west Texas to Los Angeles, to serve southern California; and a \$60,000,000 line from the Guymon field east, greatly increasing Chicago's gas supply. Gas customers for the first time exceeded 20,000,000, of which 9,497,000 were served with natural gas. Supreme court decisions confirming FPC orders reducing the rates of Panhandle Eastern Pipe Line Co., Colorado Interstate, Canadian River and Colorado-Wyoming gas companies also approved the commission's use of the prudent investment principle, permitted inclusion of production and gathering facilities in the rate base, and ruled on allocation. The commission's authority over the licensing of hydroelectric power projects on non-navigable portions of navigable streams which affect downstream capacity was sustained by appeals courts in the *Wisconsin Public Service Corp.* and *Georgia Power Co.* cases.

More than 900,000 gas consumers benefited from the \$5,094,000 annual reduction of Panhandle Eastern Pipe Line company rates and shared in the \$24,858,000 refund. Refunds of more than \$10,000,000 resulted from the \$2,745,000 annual reduction in Colorado Interstate, Colorado-Wyoming and Canadian River gas companies' rates. Natural gas rate reductions made in previous years, later confirmed by the courts, exceeded \$35,000,000 annually, representing cumulative savings to consumers of more than \$100,000,000.

Created in 1920 to administer the original Federal Water Power act, the commission rounded out its 25th year. Leland Olds, of New York, who had served as chairman from 1940 to June 1944, was elected chairman, to succeed Basil Manly, who resigned to enter private business. Nelson Lee Smith, of New Hampshire, was elected vice-chairman. President Truman appointed Harrington Wimberly, of Oklahoma, to succeed Manly as a member of the commission, and Richard Sachse, of California, to succeed John W. Scott, who resigned to practice law.

## 306 FEDERAL PUBLIC HOUSING—FEDERAL SECURITY AGENCY

**Federal Public Housing Authority:** *see* HOUSING.

**Federal Reserve System.** During 1945 the federal reserve system served the United States government, member banks and the public in giving full support to the financing of World War II and in helping to meet the emerging financial problems of reconversion. The system is a nation-wide central banking organization, created by congress, and composed of the board of governors, the 12 federal reserve banks and 24 branches.

Federal reserve holdings of government securities rose \$5,-416,000,000 during the year and stood at \$24,262,000,000 on Dec. 31, 1945. The increase resulted from purchases of certificates of indebtedness and treasury bills, with treasury bond holdings showing a decline. At the end of the year treasury bills held by the federal reserve banks comprised half of their government security holdings and accounted for three-fourths of the treasury bills outstanding.

The major factor responsible for the wartime expansion of reserve bank credit continued to be the currency outflow. Member banks draw on their reserve balances to obtain currency from the reserve banks. These reserve balances are replenished through sale of government securities to the reserve banks. This was in accordance with the system's wartime policy of keeping banks supplied with sufficient reserves to buy such government securities as were not bought and held by other investors.

At the same time, however, a basis for multiple credit expansion existed in the process through which commercial banks readily obtained reserve funds by sale of short-term low-rate government securities to the federal reserve banks. Replacement of such securities through purchase of higher-yield issues in the market resulted in bidding government securities away from nonbank holders and a further increase in the stock of bank deposits.

Some member banks at times borrowed substantial amounts from the reserve banks in order to maintain their reserve positions. Discounts and advances at the reserve banks reached \$912,000,000 on June 6, 1945—the largest amount after 1933.

By act of congress, approved June 12, 1945, the reserve requirements of federal reserve banks were reduced to a uniform minimum of 25% in gold certificates against federal reserve notes in circulation and deposit liabilities. The reserve requirements had previously been 40% in gold certificates against federal reserve notes in circulation and 35% in gold certificates or lawful money against deposits. The act also extended indefinitely the authority for the use of direct obligations of the United States as collateral security for federal reserve notes, terminated the authority to issue federal reserve bank notes, and terminated the authority to issue United States notes under the Thomas amendment.

Action by congress to reduce the reserve requirements of the federal reserve banks followed a decline in the reserve ratio of the federal reserve banks from 91% at the end of 1941, soon after the entry of the U.S. into the war, to 45% in June 1945. The decline was due chiefly to the growth of federal reserve note circulation during the war, and secondarily to a decline in gold certificate reserves of the federal reserve banks and an increase in their deposit liabilities. At the end of 1945 the ratio of gold certificate reserves to deposit and federal reserve note liabilities combined was 42%.

The federal reserve banks continued to act as fiscal agents for the war department, navy department and maritime commission in guaranteeing loans made by financing institutions to war contractors to provide working capital needed in war production and/or pending final settlement of claims arising from

terminated contracts. Although the amount of guaranteed loans outstanding declined during 1945, loans authorized in the first ten months of the year amounted to \$1,010,000,000, bringing the total amount authorized after the beginning of the guaranteed loan program in April 1942 to \$10,321,000,000.

The board of governors of the federal reserve system changed its regulations in the field of selective credit control to meet developments during the year. Regulation W, relating to consumer credit, was amended, effective Oct. 15, 1945, by exempting credits for home repairs and improvements and by lengthening from 12 months to 18 months the maturity limitation on loans which are not for the purpose of purchasing consumers' durable goods. After reviewing regulation W following the end of the war the board stated its belief that the use of consumer credit should so far as possible be discouraged until consumers' goods come on the market in sufficient supply to meet demands. Regulations T and U, which are applicable to credit extended by brokers and banks to finance purchasing, carrying or trading in stock exchange securities, were amended twice during the year. Margin requirements, which were 40% after 1937, were raised to 50%, effective Feb. 5, 1945, and to 75%, effective July 5, 1945. (*See also* BANKING; CONSUMER CREDIT.)

(J. K. L.)

**Federal Savings and Loan Insurance Corporation:** *see* HOUSING.

**Federal Security Agency.** Activities representing the responsibilities of the federal government for promoting and maintaining the health, education, economic security and welfare of the people of the United States and affecting the life of each individual, most often by way of his state or local government, were in some phases retarded and in others intensified during 1945 as a result of war conditions. However, developments all along the line in the broad scope of activities within the Federal Security agency were the subject of increasing public interest as the war drew to a close.

During 1945 the U.S. Office of Education co-operated with other governmental agencies in a variety of special war services including the development of plans for keeping youth in school; provision of school services in war areas under the Lanham act; maintenance of essential school transportation; utilization and disposal of surplus property for educational use; participation of schools in the salvage drive; making available to schools operating supplies, textbooks and essential materials for maintenance of the school plant, upon which wartime restrictions had been placed; provision of school lunches; promotion of programs of health and physical education; and the development of a sound educational approach to fundamental problems in the field of social hygiene.

In spite of wartime demands on human energy, long hours of work, overcrowding, shortage of medical and hospital facilities and personnel, the health of the U.S., generally speaking, remained good. The public health service reported marked progress in the control of malaria, venereal diseases and tuberculosis—enemies of man that commonly flourish in wartime. Protection provided by industrial hygiene services was at a high level, when there was taken into consideration the rapid changes in production methods and the tremendous increase in employment.

Within the complex of change and readjustment brought about by V-E and V-J days, the Office of Community War services, as the war arm of the Federal Security agency, carried on its appointed task of helping war areas to meet the problems imposed upon them. Services of the office lay in the fields of health, medical care, welfare, education, recreation, social pro-

tection and related areas of community well-being. Organization already effected to do the job was strengthened and geared to the rapidly changing situation. A few new facilities were established but the main goal was to help communities hold the gains already made, while they adjusted to the unwinding processes of production and the problems of deployment.

To carry out its part in the disposal of the surplus properties assigned to it, the Federal Security agency created the Office of War Property Distribution within the office of the administrator. The Federal Security agency's part in the disposal and distribution of surplus property was to act as liaison between the federal disposal agencies and the states, communities, and non-profit organizations which were in line to apply for the available property on a basis of need. The institutions eligible included publicly supported and nonprofit schools, hospitals, clinics, libraries and similar institutions. Provision was also made for other types of nonprofit institutions. On applications approved by the Federal Security agency such institutions might purchase property from disposal agencies at the "fair value," which in practice would be the lowest price for which the property was sold at any commercial level.

The division of surplus property utilization set up in the public health service was to work with state and local health officers to help them determine community needs and to make application for war property, and the similar division in the office of education was to perform the same services for school officials.

(P. V. M.)

### Federal Trade Commission.

The Federal Trade commission, an agency of the U.S. government, enforces the Federal Trade Commission act, certain sections of the Clayton act, the Wool Products Labeling act and the Export Trade act. In 1945 the commission issued 150 complaints alleging violations of the laws it administers, entered 115 orders to cease and desist from proved violations, and accepted 211 stipulations wherein respondents agreed to discontinue unlawful practices.

Proceedings instituted in the public interest under these acts were directed to promoting free and fair competition by preventing price-fixing agreements, restraint-of-trade combinations, unlawful discriminations in price and otherwise, misbranding of wool products, and other unfair methods of competition and unfair or deceptive commercial practices including false advertising; and to safeguarding health by preventing the dissemination of false advertisements of food, drugs, devices and cosmetics which might be injurious.

United States courts decided 27 cases in favour of the commission. In two of these the supreme court sustained commission orders directed against the use by two glucose manufacturers of a discriminatory basing point system of delivered prices.

The commission reported to congress its continuing investigations of distribution methods and costs, part six, milk products and parts seven and eight, fish (Great Lakes and New England); also its study of the operation of resale price maintenance contracts in 45 states where such system of pricing trademarked, branded or otherwise identified products for resale was legalized. This last report declared that in the absence of effective government supervision, resale price maintenance "is subject to use as a means of effecting enhancement of prices by secret agreements and restraint of competition by coercive action on the part of interested co-operating trade groups of manufacturers, wholesalers and retailers in such ways and to such an extent as to make it economically unsound and undesirable in a competitive economy."

As a result of its investigation of the wartime cigarette shortage, the commission reported the scarcity was not attrib-

utable to violations of law but was caused principally by diversion of a high percentage of total U.S. cigarette production to the armed forces and the Allies.

The commission recommended to congress an amendment of section 7 of the Clayton act to prohibit the corporate acquisition of another corporation's assets under the same conditions that acquisition of its capital stock had been declared unlawful by congress in 1914. The recommendation was directed against the increasing consolidations of competing corporations.

The commission instituted investigations of several of the 48 export trade associations registered with it under the Export Trade act to determine whether they were engaging in restraint-of-trade practices and agreements violative of law. One inquiry resulted in the commission recommending that an association exporting Florida hard rock phosphate readjust its business to conform to law.

The commission approved trade practice rules for the water heater, razor and razor blade, wood-cased lead pencil, low-pressure refrigerant, button jobbing and tuna industries.

(R. E. F.)

### Federal Works Agency.

The Japanese surrender in 1945 caused an abrupt shift in the activities of the Federal Works agency, from supporting the United States war effort to meeting peacetime problems.

The regular federal-aid highway program was resumed after its wartime suspension. Planning of many major highway projects had already been completed in 1945, financed partly by \$10,000,000 authorized under the Defense Highway act of 1941 and partly by federal-aid funds freed for the purpose in legislation approved July 13, 1943.

The Public Roads administration, FWA, prepared to administer the federal-aid Highway act of 1944, which authorized the greatest highway-building program in the nation's history—\$500,000,000 a year, to be matched by the states, for each of the following three years: \$225,000,000 for the federal-aid system, \$150,000,000 for secondary or farm-to-market roads, and \$125,000,000 for the federal-aid system in urban areas. The act also provided for a national system of interstate highways, not to exceed 40,000 mi., to link the principal cities of the U.S. Designation of the highways to be included was already well advanced in Washington and in the state highway departments.

The Federal Works administrator, in conjunction with the postmaster general, submitted to congress a list of eligible federal building projects outside the District of Columbia, chiefly post offices, that would cost about \$750,000,000, and requested an authorization of \$193,000,000 for early construction by the Public Buildings administration, FWA, of the most urgently needed of them. The administrator also asked authorization and funds for an extensive building program in the Washington area. Congress was considering requests as the year 1945 ended.

Construction activities under the Lanham act were discontinued as rapidly as practicable. Projects on which construction had not begun were cancelled; those already under way were carried to a useful stage wherever it appeared that the need would continue. Arrangements were made to discontinue service projects—war nurseries and child care centres—March 1, 1946, and financial aid for regular school programs at the close of the 1945-46 school year.

The making of non-interest-bearing advances, through the Bureau of Community Facilities, FWA, to states and their political subdivisions for plan preparation of local public works was accelerated. Authorized by Title V of the War Mobilization and Reconversion act of 1944, this program went into operation July 1, 1945, when an initial appropriation of \$17,500,000 became available. The funds were to be allotted among the

## FEDERATED MALAY STATES—FERTILIZERS

states, 90% on the basis of population, and 10% at the discretion of the administrator.

Requests for advances, to be repaid when construction was begun, soon exceeded available funds. The First Deficiency Appropriation act of 1946 included an additional appropriation of \$12,500,000 to continue the program until the end of the fiscal year. Sewer and water systems, schools, hospitals, health centres, public buildings, and improvements to roads and streets ineligible for federal-aid highway funds were among the leading types of projects for which the localities sought planning advances.

The law stipulates that the making of advances for planning does not commit the congress to pay all or any part of the cost of construction of local public works projects. The program enables states and their subdivisions to build up a shelf of complete architectural, engineering and legal plans for needed public works in advance, so that their construction may be so timed as to help stabilize the construction industry. The normal procedure of financing both construction and planning of public works by the sale of bonds would make advance planning impracticable for most localities without the assistance provided by this program. (See also HOUSING.) (P. B. F.)

### Federated Malay States.

One of the three principal administrative divisions of British Malaya, the other two being the Straits Settlements and the Unfederated Malay States (*qq.v.*). There are four Federated States—Perak, Selangor, Negri Sembilan and Pahang. The first three are on the west coast of the elongated Malay peninsula, while Pahang is on the east coast. Area: 27,540 sq.mi; pop. (est. 1941) 2,193,605, distributed as follows: Perak, 984,464; Selangor, 696,173; Negri Sembilan, 293,510; Pahang, 219,458. The capital and largest city is Kuala Lumpur (Selangor), pop. (1939) 138,425. Racially the population was divided as follows (est. 1941): Europeans, 11,019; Eurasians, 5,226; Malays, 713,679; Chinese, 978,208; Indians, 468,029; others, 17,444.

A process of commercial contact and political expansion brought this area under British administration between 1874 and 1914, Perak being the first state to accept British control. The system of government before the Japanese occupation (1942) was the maintenance in each state of a native sultan. But, "except in matters touching Malay religion and customs," authority was in the hands of a British resident in each state. Co-ordinating authority was in the hands of a British high commissioner, who was also governor of the Straits Settlements. This joint office, until the Japanese occupation, was held by Sir Thomas Whitelegge Shenton Thomas. The Japanese preserved the essential features of the former system, substituting their own military "advisers" for the British residents and outwardly respecting the authority of the native sultans. The Federated Malay States, like other parts of Malaya, were returned to British sovereignty after the Japanese surrender in Aug. 1945.

**Education.**—Schools of various types were provided for the heterogeneous population. There were 35 English schools for boys (13,564 pupils) and 14 English schools for girls (5,941 pupils). There were 582 Malay schools (63,638 pupils) and 572 Chinese schools (58,227 pupils). There were also 580 schools in the Tamil language, spoken by many of the Indians in Malaya, attended by 23,527 pupils. Expenditure on education (1940) £437,796.

**Finance.**—Revenue in 1940 was £11,493,060, expenditure was £9,166,303. Public debt at the end of 1940 was £9,950,000.

**Agriculture and Mineral Production.**—Rubber and tin are the most important products. There were 1,699,459 ac. of rubber plantations in 1940, 251,960 ac. in coconut groves, 186,310 ac. in rice paddies, 40,629 ac. of oil-bearing palms. Mineral pro-

duction in that year was as follows: tin 35,689 tons; gold, 81,633 oz.; tungsten 90 tons; coal 781,508 tons. There were 90,145 miners, mostly Chinese, while the labourers on the rubber plantations were mostly Indians. (See also JAPAN.) (W. H. CH.)

**Federation of Labor, American:** see AMERICAN FEDERATION OF LABOR.

**Feldspar.** Sales of crude feldspar in the United States rose to 366,697 short tons in 1944, from 345,162 tons in 1943, accompanied by a 10% increase in value as compared with the 6% increase in quantity. Sales of domestic ground spar totalled 337,491 tons, and of ground Canadian spar 7,710 tons, making a total of 343,201 tons, of which 64% was used in glass and 31% in pottery. In spite of a growing use of competing products in the making of glass, the consumption of feldspar in glass continued to expand.

Canadian shipments of feldspar dropped from 23,858 short tons in 1943 to 23,509 tons in 1944, but improved in 1945, the total for the first three quarters of the year being 20,385 tons. (G. A. Ro.)

**Fencing.** Four inactive divisions of the Amateur Fencers League of America were reactivated in the United States in 1945 and one new division applied for a charter.

The greatest fencing activity was, as usual, in the east around New York with California, Michigan, Ohio and Illinois showing renewed interest.

The national championships were held in New York city. In foil, Dernel Every (New York Athletic club) won the title he last held in 1940. Alfred Snyder (Fencers club) defending champion was second and Warren Dow (New York Athletic club) former champion was third. In épée, a new winner, Max Gilman (Illinois division) placed first, James H. Flynn (New York Athletic club) second and Fred Linkmeyer (Los Angeles Athletic club) Pacific coast champion, third. In sabre, Norman Armitage (Fencers club) regained the title he last held in 1944 and placed first for the tenth time. James H. Flynn (New York Athletic club) was second and Tibor Nyilas (Salle Santelli) defending champion, third. In the women's event another new champion was crowned when Miss Maria Cerra (Fencers club) nosed out her teammate Mrs. Helena Dow (twice champion) for first. Miss Madeline Dalton (unattached) defending champion, was third.

In the Pacific coast championships, Edward Carfagno (Los Angeles Athletic club) successfully defended his foil and sabre titles. His teammate Fred Linkmeyer won the épée. Miss Janice York (Faulkner School of Fencing) won the women's event.

In the midwest championships Byron Krieger (Michigan) successfully defended his sabre title and also won the foil title. Ivan Gilbert (Columbus, O.) again won the épée championship. Miss Paula Sweeney (Michigan) won the women's championship for the third consecutive time. (W. A. Dw.)

**Fertilizers.** Victory in Europe in May 1945 sped up fertilizer production and use in many countries. During the war recognition of the importance of chemical plant foods grew apace throughout the world. The farmers of the United Nations and of axis and neutral countries did a stupendous job of crop production despite withdrawal of tens of millions of men from farms to the armies and to war and essential civilian industries. As farm incomes throughout the world showed signs of future decline, the hastened tempo of fertilizer consumption promised to slacken but still to continue in higher volume than in the prewar period. The total crop output of U.S. farms, for example, in 1944 and 1945 exceeded the 1935-39 average by

fully 33%. Fertilizers, liming materials, pesticides, improved farm machinery, better crop varieties including first generation hybrids and many other factors contributed to this result, but none more than commercial fertilizers. Statistics for foreign countries continued to be meagre in spite of the fact that prohibitions on the publication of pertinent data were lifted.

The only detailed national figures of fertilizer consumption available for World War II were those for the United States. In 1938 total use in the U.S. was 7,758,000 short tons; in 1944 it was 12,468,000 tons. Figures for 1945 were not available but advance estimates indicated a further increase over the previous year.

Synthetic nitrogen production capacity was in 1945 at the highest point in world history. While plants in axis-controlled countries were bombed mercilessly, new construction in other nations, particularly the United States and Canada, was far greater than immediate peacetime consumption would warrant. The group of materials involved included ammonia solutions, cyanamide, ammonium nitrate, synthetic ammonium sulphate and sodium nitrate, urea compounds and some others. An acute industrial problem depended on the policy adopted as to the disposal of some 8 or 10 large U.S. government-owned synthetic plants built for war purposes. Total capacity in the U.S. which includes 9 private plants was twice as great as the peak wartime agricultural use. Canada built 4 new plants and apparently counted on their continued operation largely to supply the U.S. market where excessive capacity already existed. Canadian use was relatively small. Nitrogen production as by-product ammonium sulphate depended on the rate of coke production for steel manufacture throughout the world. In the U.S. many factors including exhaustion of high-grade iron ore were expected to reduce steel production from the wartime peak of about 100,000,000 tons in 1943—more than the total from 1863 when statistics begin to 1900—to the usual peacetime rate of between 50,000,000 and 60,000,000 tons annually. Sulphate of ammonia is the chief nitrogen carrier used in compound fertilizers. Natural nitrate of soda from Chile was expected to be available to supply any likely demand up to 2,000,000 short tons. This material continued to be the preferred nitrogen carrier for top and side dressing. Organic nitrogenates from crop and animal sources were diverted largely to feed use. They promised to remain meagrely available as fertilizers with some improvement as world transport conditions get better.

Phosphatic fertilizers, chiefly in the form of normal (18% to 20%  $P_2O_5$ ) and concentrated (43% to 48%) superphosphate, were expected to increase rapidly in supply if market demand called for them. The phosphate rock deposits of the U.S., North Africa and Russia are adequate to supply world needs for many centuries, particularly as phosphorus becomes fixed readily in the soil and does not leach out as do nitrogen and potash.

The world potash outlook was favourable with a new factor of uncertainty because of soviet claims of discoveries of tremendous deposits of potassium salts in the vicinity of Solikamsk, a town northeast of Perm in European Russia, located just west of the main range of the Urals. Heretofore the greatest known deposits were those of Germany which were estimated to be sufficient to supply world demand for thousands of years. Known American deposits were sufficient for fewer than 200 years at the existing rate of use. They were severely exploited during the war years, production in terms of  $K_2O$  contained having risen from 302,000 tons in 1935 to approximately 850,000 tons in 1945. France, Poland, Spain and Palestine were expected to increase their contribution to world supply but future development necessarily depended chiefly on soviet policies toward permitting Germany to return to the world market which it had developed during the previous 90 years. A Russian authority claimed that

the Solikamsk deposits contained reserves 35 times as great as all the rest of the world. Discovery of potash salts in Western Australia in the vicinity of Lake Campion in the form of alunite was reported in 1944.

Agronomic knowledge concerning crop nutrition has grown with great rapidity. Crops, like animals including human beings, must be properly nourished. Nitrogen, phosphorus, potassium and calcium are usually regarded as the essential plant foods. Research has shown that deficiencies in other elements may determine success or failure in growing certain crops. These elements are usually referred to as minor, trace or secondary elements. Included are manganese, boron, iron, zinc, magnesium, copper and sulphur. For some crops and soil areas cobalt, iodine and molybdenum may also be required. The effect of these minor elements may be nutritional, catalytic or functional. In the case of Florida citrus fruits minute quantities of trace elements have rendered citrus trees less sensitive to cold and less subject to plant diseases. (See also AGRICULTURE.)

**Finland.** An independent republic of northern Europe. Area, 134,000 sq.mi. (land area, 121,000 sq.mi.), after cession of 13,500 sq.mi. to the U.S.S.R. in 1940 and again in 1944. Pop. (est. of 1940) 3,850,000. Capital, Helsinki; pop. (est. Jan. 1, 1939) 304,965. Other principal cities: Turku (Åbo) (74,351); Tampere (76,730); Viipuri, ceded to the U.S.S.R. (74,247). Language and nationality, 90% Finnish, about 10% Swedish. Religion, Lutheran Christian. President after Aug. 4, 1944: Carl Gustav von Mannerheim; prime minister after Nov. 17, 1944 (and acting president during Pres. Mannerheim's illness in the spring of 1945 and absence in the latter part of the year), Juho K. Paasikivi. Anglo-Soviet control commission headed by Col. Gen. A. A. Zhdanov.

**History.**—Finland's troubles did not end when it made peace with Russia and Britain on Sept. 19, 1944. The reparations of \$300,000,000 were heavy (though but half the original demand); the contraction of territory by loss of the Petsamo area, Viipuri and the Karelian region meant a shift of more than 10% of Finland's population as well as loss of points of great economic importance; the grant of aerodrome and port facilities to Russia and the pledge to hand over German soldiers as war prisoners to Russia involved a strain on both pride and energy.

The most immediate problem was the last mentioned, and mop-up operations against the Germans remaining in Finland began in the fall of 1944. The campaign drove them steadily northward and across the border into Norway. By spring only a tiny pocket of resistance remained in the Finnish tongue of land between Norway and Sweden. Evidently to facilitate Russian use of Finnish bases Finland formally declared war on Germany on March 3, 1945, announcing then that a state of war had actually existed from Sept. 15, 1944, when German forces attacked the island of Hogland.

Political reorganization was difficult, but seemed to progress "as well as could be expected" under the firm and farsighted guidance of Premier Paasikivi. The premier's basic policy was one of friendly co-operation with Russia within a framework of Finnish independence. Elections to the 200-member unicameral parliament were held on March 17 and 18, with a considerable change from 1939 in the party lineup. Broadly speaking, the left gained at the expense of the right, and the formerly predominant Social Democrats lost many seats to the coalition called Popular Democrats (40 of whose 49 deputies were communists). Even then the total vote amassed by the right was about 732,000 as against 711,000 for the left. The Finnish Nazi party (formerly holding eight seats) was banned from the elections, and a number of the former anti-Russian leaders like Väinö A. Tanner, Edwin Linkomies, Henrik Ramsay and Tyko Reinikka, did not stand for election. The two days of voting were ushered in by Paasikivi's warning that it was not enough merely to observe the letter of the armistice with Moscow, and that the elections were the supreme opportunity for Finland to prove its intentions. The results gave: Social Democrats (anti-Moscow) 50 seats, a loss of 35; Popular Democrats (pro-Moscow) 49 seats; Agrarians 48 seats, a loss of nine; Conservatives 29 seats, a gain of two; Swedish Peoples' Party 16 seats, a loss of two; Liberals (or Progressives) 7 seats.

The cabinet resigned after the elections according to custom, but Paasikivi retained his position in a new-formed government, the partial makeup of which was: prime minister, Juho K. Paasikivi (non-party); foreign minister, Carl J. A. Enckell (non-party); minister of finance, M. Tuomija (Liberal); minister of the interior, Yrjö Leino (communist). By party the total cabinet contained four communists, four Social Democrats, two Popular Democrats, four Agrarians, two non-party and one Swedish Peoples' party.

The Russians appeared pleased at the trend of the elections, but they had taken no visible part in the campaign. Everything indicated that they were quite ready to let the Finns make their own decisions—and be responsible for their actions. In a speech on April 7 at the opening of the new parliament Pres. Mannerheim called for "lasting, friendly relations, founded on common interests and mutual confidence, with the soviet union" and for a complete reform of Finnish agriculture.

The armistice terms bore heavily on Finland, and inevitably resentment expressed itself. Some of the opposition was natural and innocent, but more serious tensions were indicated by the arrest of 34 Finnish general staff officers in July, for storing of arms and sabotage of the armistice. In September some 200 arrests were made and "second officers" of the general staff were rumoured to be implicated in a plot involving storage of arms in each of Finland's former "protective corps" districts. Early in August the Soviets relaxed some of the restraints on Finnish shipping and travel, and new hope arose. However, in October two new demands for reparations created despondency: \$15,000,000 payment for German assets in Finland, and \$14,000,000 for damage inflicted by the Finns during the occupation of Karelia, both payments to be made in 1946. This burden, added to the \$50,000,000 annual payment on the \$300,000,000 agreed on in 1944, had to come from a country with depleted resources, few ships and with small chance of remunerative trade. The prospect was bleak. The fact that payments had to be made in kind actually worked out to a doubling (in current values) of the monetary figure of reparations, and thus to a still tighter channelling of all Finnish exports to Russia. Under these circumstances the political freedom carefully left to the Finns was of slight satisfaction.

Following the Russian lead (Aug. 6), Britain and the U.S. resumed diplomatic relations with Finland (resumption of U.S.

relations with Finland dated officially from Sept. 1). Since the U.S.S.R. and Great Britain were the chief Allies at war with Finland (the U.S. broke off relations on June 30, 1944), they alone negotiated the armistice and maintained the control commission in Helsinki. The London conference of foreign ministers failed to reach agreements on implementing the peace, but the conference in Moscow in December opened the way for the participation of all major Allies in the definitive peace treaty.

Restoration of trade relations with the west was attempted: an agreement with Britain, beginning Aug. 17, 1945 and continuing to June 30, 1947, permitted normal trade and financial transactions. Some export of pulpwood to the U.S. was resumed in the late fall and the U.S. Export-Import bank on Dec. 13 granted a 15-month credit of \$5,000,000 for Finnish purchase of U.S. cotton. British agents were reported vigorously pushing trade on a credit basis.

The prosecution of war criminals was perhaps more difficult in Finland than in most countries, for it was hard to separate war criminals, war culprits and the various others who were merely anti-Russian or anticommunist. Early in the year an investigating committee had been set up under the chairmanship of Dr. Erik Hornborg. The trials got under way only in mid-November, after much prodding by the control commission, and the passage of a law by the Riksdag (Sept. 11) providing for punishment of those responsible for taking the country into war on the German side. On Nov. 6, eight men were dramatically arrested and on the 15th were brought to trial. The leaders charged with war guilt, and their former positions, were: Risto Ryti, president; Edwin Linkomies, premier; Johan W. Rangell, premier; V. A. Tanner, minister of finance and head of Social Democratic party; Tyko Reinikka, minister of finance; Henrik Ramsay, minister of foreign affairs; Antti Kukkonen, minister of interior; Toivo Kivimaeki, minister to Berlin.

One of the many tragedies in war-ravaged Finland was the taking by the soviet authorities of about 1,000 "white Russians," refugees from the revolution of 1917. In general, however, Russian activity was restrained, new papers appeared, and the Finns were beginning courageously the long job of reconstruction.

No new statistics on education, finance, trade or communication, etc., were available after 1939. (F. D. S.)

**Finlay, William Finlay**, 2nd Viscount, of Nairn (1875-1945), British jurist, was born in London and was educated at Eton and at Trinity college, Cambridge. Called to the bar at the age of 26, Lord Finlay specialized in revenue cases, later became a judge of the high court of justice, King's Bench division, 1924. Subsequently, he was appointed a Lord Justice of Appeal, 1938, and at the start of World War II headed the Contraband committee, which planned a tight blockade around Nazi territory.

In Jan. 1945 he was named to the United Nations War Crimes commission, succeeding Sir Cecil Hurst. He died at Redhill, Surrey, June 30.

**Fire Insurance:** see INSURANCE.

**Fires and Fire Losses.** The losses by fire, including lightning, in the United States as compiled by the National Board of Fire Underwriters for 1945 amounted to \$455,329,000. This compares with \$423,538,000 for 1944 and \$380,235,000 for 1943. The losses by fire in 1945 were the largest after the year 1930.

There were no fires which rose to the magnitude of a conflagration. It is reasonable to suppose that the general wear and tear on business properties might have been responsible

GREAT LAKES passenger-freight liner "Hamonic," destroyed by fire spreading from an exploding gasoline engine on the dock at Point Edward, Ont., on July 17, 1945. More than 150 persons sustained injuries and property damage was estimated at \$2,000,000. No lives were lost

for some, at least, of this increase. The adoption of what is called the "off premises" loss, for example, clothes in the hands of cleaners, where the policy might cover up to 10% of its value, was said to have potential and actual losses that were not anticipated. One was estimated to cost nearly \$1,000,000 by such a coverage. (See also DISASTERS.)

**Fires and Fire Prevention:** see WARFARE, INCENDIARY.

**Fischer, Hans** (1881-1945), German chemist, was born July 27 at Hoechst. Educated at Lausanne, Marburg and Munich universities, Fischer spent a year on the faculty of Munich university, 1915, later taught at Innsbruck and at Vienna and in 1921 became professor at the Technische Hochschule in Munich. He won the Nobel prize in chemistry (1930) for his discovery and isolation of hematin (the red corpuscle colouring matter). Colleagues regarded his work in blood chemistry as one of the most important steps toward discovery of the common ancestor of blood and chlorophyll. He attended the Harvard Tercentenary celebrations in 1936 when he led the discussion on chlorophyll at the arts and sciences conference. Though he remained in Germany during World War II, he was thought not to be on friendly terms with the Nazi regime. A Berne report of April 6 told of his death.

**Fish and Wildlife Service:** see FISHERIES; WILDLIFE CONSERVATION.

**Fisher, Geoffrey Francis** (1887- ), 97th archbishop of Canterbury, was born May 5, the youngest son of the Rev. H. Fisher, rector of Higham-on-the-Hill, Nuneaton. The primate of all England was educated at Marlborough and at Exeter college, Oxford, and, after a short period of training at Wells theological college, became an assistant master at Marlborough in 1911. He was ordained deacon

at Salisbury in 1912 and a priest in 1913. In 1914 he was appointed headmaster of Repton school, in Derbyshire. In 1917 he married Rosamond Chevallier, granddaughter of Dr. S. A. Pears, a former head of Repton. In 1932 he was consecrated bishop of Chester and in 1939 bishop of London. While in London he relinquished ownership of Fulham palace, traditional home of London's bishops, to the ecclesiastical commissioners, preferring to live as a tenant in a small part of the vast residence. He was nominated archbishop of Canterbury in succession to William Temple on Jan. 5, 1945, elected on Jan. 23 and enthroned on April 19.

**Fisheries.** The fish and wildlife service of the United States department of the interior reported early in December that the yield of U.S. fishery products in 1945 would probably equal the average prewar figure as a result of the restoration of about normal operating conditions in the fishing industry but would probably fall slightly below the 1944 yield. The catch of all species was expected to total approximately 4,400,000,000 lb., equivalent to average production during the five years preceding World War II. (The fisheries of the world normally yield about 37,000,000,000 lb. in a year.)

The U.S. yield had suffered a drastic reduction during the first year of war. In 1942 the catch, in fact, declined to 3,900,000,000 lb. By the end of 1943, however, special wartime measures had become effective and the catch rose to 4,200,000,000 lb., and in 1944 the 4,500,000,000-lb. catch exceeded the peacetime average.

The chief reason cited by the fish and wildlife service for the 1945 decrease from the 1944 production was a decline of about 225,000,000 lb. in the catch of pilchards, or California sardines. The pilchard industry, it was pointed out, accounts for about one-fourth of the total U.S. fish catch and the success of this fishery may thus determine whether the year's total is above or below average. By Nov. 17 the 1945 pilchard catch had reached a total of 353,501 tons, compared with 466,909 tons by the same date in 1944. (An improved manpower situation in canneries had, however, made it possible to pack 3,132,322 cases of canned pilchards, an increase of about 9% over 1944.)

Production for the fresh fish markets in 1945 was generally high throughout the country. All the major ports of New England, which receive the catches made by the trawling fleets on the New England and Nova Scotia banks, handled more fish than at any time after the beginning of World War II. Landings at the principal New England ports (Gloucester, Boston, New Bedford and Provincetown, Mass., and Portland, Me.) totalled about 525,000,000 lb. by mid-November, compared with about 430,000,000 lb. in 1944. In New York, receipts of fishery products rose from 190,285,865 lb. during the first three quarters of 1944 to 217,075,480 lb. in 1945. In the Chesapeake bay area, receipts at Norfolk, Va., amounted to 24,703,590 lb. for the first 10 months of the year, a gain of about 2,500,000 lb. over 1944. In the Gulf of Mexico area, landings of fresh and salt-water fish increased about 15% over 1944 and totalled about 9,000,000 lb. by the end of October; receipts of hard crabs increased from 10,323,000 lb. to 11,767,000 lb.; while oysters had declined slightly from 507,000 bbl. to 435,000 bbl. Receipts at the port of Seattle, Wash., for the first 10 months of 1945 were up 35% to a total of 70,716,955 lb., comprising chiefly halibut, rockfish, flounders, salmon and sablefish.

In contrast to the generally upward trend of the fresh fish trade, the total canned fish pack was about 6% under that of 1944. On both the Atlantic and the Pacific coasts the pack of mackerel was extremely small. On the Atlantic coast only 44,351 cases had been canned by the end of September, compared with 175,998 cases in 1944. The pack of Pacific mackerel through October was 309,251 cases, as against 645,320 cases in

SWORDFISHERMAN off the coast of Massachusetts during the summer of 1945, with a haul of fish, some weighing more than 400 lb. Sighted from the masthead, the fish are speared with harpoons and later hauled up by the tail

1944. The Maine sardine industry, with a pack of 2,007,784 cases for the first three quarters of 1945, was running almost 20% behind the 1944 pack, while on the Pacific coast the salmon pack declined from 5,138,647 cases in the 1944 season to 4,833,333 cases in 1945. California tuna, however, by Oct. 31 had provided a pack of 2,995,757 cases, 437,000 more than on the same date in 1944. Shrimp receipts had totalled 222,152 bbl. as compared with 288,483 bbl. in 1944, yet the canned pack of 113,813 cases was only about one-third of the 1944 pack.

Before the end of 1945 the U.S. fishing fleet, which was reduced to critically low levels immediately after the U.S. entered World War II, had been built up to its prewar size. The government had authorized the building of a total of 2,128 fishing craft, many of which were already fishing in 1945. All but 85 were scheduled for completion by the end of the year, and the balance was scheduled to come off the ways by the latter part of 1946. The fishing fleet normally loses about 275 boats a year through disaster or the wearing out of vessels. In addition to these normal losses, about 700 of the largest and most productive fishing vessels were requisitioned for military service early in the war. Some of these had been returned. Others were still in service, but their loss had been more than compensated for by new construction. A few classifications of vessels—notably tuna clippers and large New England trawlers—were still below the prewar level, but the fleet as a whole had become larger than before the war and its productive capacity was considerably greater because of the large proportion of new boats.

The office of the coordinator of fisheries, the wartime agency through which the government met the nation's fishery prob-

lems, began a progressive demobilization on Sept. 30. The office planned to retain a small staff at its Washington headquarters for the purpose of handling special problems in connection with the reconversion of the fishing industry to a peacetime basis, but most of the area offices were to be closed. These offices had given the industry assistance in securing priorities; in obtaining materials, equipment and supplies; in interpreting government regulations; and in certifying keymen for draft deferment. Most of them were staffed with personnel detailed from the fish and wildlife service.

"Probably no other nation in the world was able to maintain its wartime production of fish so well," said Deputy Coordinator Ira N. Gabrielson in the office's annual report for the fiscal year ended June 30. Dr. Gabrielson, who also was director of the fish and wildlife service, pointed out that most of the European fisheries were shattered, their fleets destroyed, their shore facilities wrecked, their accustomed fishing waters sown with mines. "... Most Asiatic fisheries," he said, "were affected in similar fashion."

"The wartime difficulties suffered by the fisheries of the United States," said Dr. Gabrielson, "differed in character and in degree from those of most of the belligerents, but the impediments to operation, especially in the early years of war, were none the less real. The wartime achievements of the fishing industry are a record of distinguished service, and a testimony to what may be accomplished by co-operation in a common cause between government and industry."

Fishery resources, it was pointed out, provided larger quantities of protein foods, vitamin oils and numerous industrial materials needed for war than had been thought possible, yet the resource was "maintained in essentially sound condition" and the industry itself emerged from the war in good condition.

"In carrying out its wartime task of supplying the aquatic products needed for war," said Dr. Gabrielson, "the coordinator's office has also taken care to safeguard the fishery resources from excessive drains which would impair their future value to the nation. In happy contrast to the situation at the end of World War I, the fisheries as a whole have been maintained in sound condition. Instead, therefore, of being faced with the need of rebuilding depleted stocks and decimated runs of fish, we may now proceed to the postwar development and expansion of a sound and vital resource."

A public understanding of the nature of this resource and the problems in its conservation was greatly facilitated during the year by publication of the results of a survey conducted by the fish and wildlife service of the fishery resources of the U.S. and its possessions. Published by the government printing office as Senate Document No. 51, 79th Congress, 1st Session, with the title *Fishery Resources of the United States*, this report touched on "all the important aquatic species utilized by United States fishermen"; included drawings of the various species and distribution maps showing "in a general way the ranges over which the various species are frequently caught"; and presented a wealth of information with a striking typography of text, charts and drawings. In transmitting the report to the senate, Secretary of the Interior Harold L. Ickes wrote significantly as follows:

In making this study, the fish and wildlife service . . . has attempted to distill, from a massive volume of statistical, biological and industrial data, the essential facts needed to see clearly and objectively the present condition of our national aquatic resources and of our conservation of them. It is concluded from the study that throughout its entire history the federal government has never given adequate care to these resources.

The recommendations derived from the conclusions are stated as very general principles. These are intended to guide the formulation of specific programs which will enable the United States to take intelligently the leadership in world aquatic industries that seems about to be thrust into its hands. Because the long range of American fishing interests will broaden on a vast scale after this war, these programs must be made flexible and must remain so. This department proposes to submit to the congress for its consideration, in future months, suggestions for specific

legislation covering federal functions in economic, technological, and biological aspects of the development, utilization, and maintenance of the fishery resources. These will be based on the material presented in this report. (See also MARINE BIOLOGY.)

**Fleming, Sir John Ambrose** (1849–1945), British physicist, was born Nov. 29, at Lancaster. For his earlier career see *Encyclopædia Britannica*. A pioneer in applied electrical science, he was closely associated with the introduction in Great Britain of the telephone, electric lighting and wireless telegraphy. He died at Sidmouth, Devonshire, England, April 19.

**Flexner, Bernard** (1865–1945), U.S. lawyer and Jewish leader, was born Feb. 24 in Louisville, Ky. He received his Bachelor of Laws degree at the University of Louisville, 1898, and was admitted to the Kentucky bar the same year. He subsequently moved to New York where he continued the practice of law. During World War I, Flexner was a member of the American Red Cross commission to Rumania, July 1917. After viewing the plight of Jews in that country, he advocated resettlement of Jews in Palestine. He was active in the Zionist Organization of America and attended the World Zionist conference in London. In 1925 he organized the Palestine Economic corporation, designed to provide credits for and promote industry and commerce in Palestine. In 1933 he participated in organizations that aided German refugees fleeing Nazi persecution. In addition to his interests in law and Zionism, Flexner was also an authority on juvenile welfare, and he collaborated in preparing a report in 1929 that urged establishment of domestic relations clinics staffed by psychologists and social investigators to deal with problems of juvenile delinquency. Flexner died in New York city, May 3.

**Floods and Flood Control.** Exclusive of the large projects previously authorized for the alluvial valley of the Mississippi river and for the Sacramento river, Calif., construction work on the federal program for general flood control was begun in 1937 after the first funds for that purpose were appropriated by congress. By the end of June 1945, 49 reservoirs and 114 local protection projects were in operation throughout the United States. In addition to previous authorizations, congress, in the Flood Control act approved Dec. 22, 1944, authorized expenditures amounting to \$750,000,000 for approximately 150 additional flood control and multiple-purpose projects and for the continuation of previously approved river basin plans. With the passage of the 1944 act, congress approved authorizations totalling \$1,680,400,000 for the construction of about 650 reservoir and local protection projects. In the period from 1937 through June 30, 1945, funds totalling \$605,742,000 were appropriated for the prosecution of the general flood control program.

All of the authorized projects were parts of comprehensive co-ordinated plans for the development of the river basins of the nation to provide economical flood protection and allied benefits for centres of industry and population, thousands of acres of rich agricultural lands and vital lines of communication. In addition to their use for flood control, many of the reservoirs provided favourable possibilities for hydroelectric power generation, stream flow regulation, water conservation, recreation and other water uses.

During the year, the Barker dam on Buffalo Bayou, Tex., was

essentially completed to provide partial flood protection for the city of Houston. The local protection projects for Tulsa, Oklahoma and the East Peoria Drainage and Levee district, Ill., were essentially completed to protect those highly industrialized areas from flood damage. The improvement of the Vermilion river, La., to provide flood protection for a large agricultural area, and the local protection project on the Ohio river at Jeffersonville and Clarksville, Ind., were continued during the year.

Subsequent to the cessation of hostilities in Europe, certain projects considered to be essential to the public health and safety were placed under way. By the close of the fiscal year 1945, construction had been initiated on a project for Lytle and Cajon creeks to protect the cities of San Bernardino and Colton, Calif., and vital Pacific coast railroad facilities from flood damage. Construction work on four local protection projects in the Ohio river basin, which were suspended during the war, was resumed to provide flood protection for the cities of Evansville, Ind.; Paducah, Ky.; Portsmouth-New Boston and Cincinnati, O. The raising of existing levees along the Mississippi river between Alton and Gale, Ill., was also resumed.

In addition to the general flood control program, work on the projects authorized separately for the alluvial valley of the Mississippi river and for the Sacramento river, Calif., was continued throughout the year to protect agricultural lands, communities and principal arteries of communication.

Pursuant to authority provided by congress in the Flood Control act of Aug. 18, 1941, and in the act of May 29, 1944 (Pub. Law No. 318, 78th congress), an extensive program of emergency flood control work was undertaken to repair levees and other flood control structures damaged or destroyed by the floods of 1944 in order to restore protection to flood-threatened areas. As the result of major flooding which occurred during the year 1945 on the Ohio, Missouri, Arkansas, Red and Mississippi rivers, as well as on numerous other streams throughout the United States, congress again enacted emergency legislation (Pub. Law No. 75, 79th congress, approved June 5, 1945) to authorize the appropriation of \$12,000,000 for emergency flood control work to repair levees and other flood control structures damaged or destroyed by those floods. The great majority of the damaged structures were constructed by local people or organizations and were of insufficient grade to withstand the crest stages resulting from such large floods. During the flood periods,

FLOODED STREETS in Louisville, Ky. The Ohio river crested at 19.1 ft. above flood level on March 9, 1945, with 900 acres of the city under water

corps of engineer personnel directed and carried out an effective program of flood fighting and rescue work in the affected areas. (See also DAMS; FORESTS; IRRIGATION; METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION.)

FILMS.—*Work of Rivers* (Encyclopædia Britannica Films Inc.). (R. A. Wr.)

**Florida.** An extreme southeastern state of the United States, called the "Peninsula state" because of its peculiar outline. Its coast line, not taking into account its numerous bays and indentations, is greater than that of any other state, extending 472 mi. along the Atlantic and 674 mi. along the Gulf of Mexico. Area, 58,560 sq.mi., of which 4,298 sq.mi. are water surface; pop. (1940) 1,897,414, of which 1,045,791 were urban and 851,623 were rural; 1,384,365 white and 513,049 Negroes. Only about 60,000 were foreign-born. Capital, Tallahassee (16,240 in 1940). The larger cities are Jacksonville (173,065), Miami (172,172) and Tampa (108,391). By the state census (1945) Florida had a population of 2,249,649. Population figures for the three larger cities, Jacksonville, Miami and Tampa, were 206,442, 192,122 and 124,476 respectively.

**History.**—The state elective administrative officers in 1945, whose terms were to expire in Jan. 1949, were as follows: Millard Caldwell, governor; R. A. Gray, secretary of state; J. Thomas Watson, attorney-general; J. M. Lee, comptroller; J. Edwin Larson, state treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

**Education.**—The biennial report of the state superintendent of public instruction, 1942-44, showed enrolment in the public schools for 1943-44 through grade 12 as follows: white 288,071; Negro 101,605; total 389,676. There were 1,766 elementary and 674 secondary public schools in the state, with instructional staffs totalling 13,305 teachers, of whom 9,993 taught in the schools for whites and 3,312 in the schools for Negroes.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Florida disbursed for pensions, benefits and public welfare \$16,991,752.92 in 1944-45. From grants by the federal government, the state received in 1944-45, for old-age pensions \$7,034,910.55; for dependent children \$985,625.04; and for pensions for the blind \$423,163.80. Disbursements for old-

age assistance were \$14,043,066.48; for dependent children \$1,992,408.65; and for the blind \$846,327.60. The unemployment benefit receipts were \$923,301.56, with benefit disbursements of \$843,833.50.

Florida has no state penitentiary, but maintains a prison farm at Raiford, an Industrial School for Boys at Marianna and an Industrial School for Girls at Ocala. The appropriation for these institutions for 1944-45 carried the sums of \$665,394.82, \$240,943.17 and \$87,587.68, respectively. The state also supports a state hospital for the insane at Chattahoochee, the Florida Farm colony for the feeble minded at Gainesville and the Florida School for the Deaf and Blind at St. Augustine. The total disbursements for charities, correction and hospitals for 1944-45 were \$3,045,283.41.

**Communications.**—The total highway mileage in the state in 1945, exclusive of roads built for military purposes for which no figures were obtainable for publication, was about 13,400 mi., of which approximately 8,000 mi. were paved or hard-surfaced. Disbursements by the state road department for the fiscal year ending June 30, 1945, for maintenance and construction, amounted to \$14,515,305.43, mostly for maintenance. The state road department budget for 1946 for construction was \$29,839,798, plus \$9,160,202 for maintenance and other departmental costs. Florida in 1945 had about 6,000 mi. of railroads.

**Banking and Finance.**—On June 30, 1945, there was a total balance in the treasury of \$35,278,468.49. The state is constitutionally forbidden to incur a debt by borrowing except to put down rebellion or repel invasion. The constitution also prohibits the legislature from levying an income tax, and a constitutional amendment forbids any state ad valorem tax on real estate. Homesteads are constitutionally exempt from taxation by local taxing units up to the value of \$5,000.

On June 30, 1945, there were within the state 56 national banks with deposits amounting to \$1,113,055,000 and 112 state banks and trust companies with deposits of \$430,256,000, representing total deposits of \$1,543,311,000, a gain in deposits of \$206,232,000 in the fiscal year.

TROPICAL HURRICANE lashing the coast of Florida in Sept. 1945. Traveling at a peak velocity of 143 m.p.h., it tore through southern Florida destroying crops, buildings and communications. Damage was estimated at \$50,000,000

**Agriculture.**—In 1940 the U.S. census showed that there were 62,248 farms with a total acreage of 8,337,708 ac., of which 1,751,275 were in crops; 462,248 were idle (fallow); 2,643,065 were in pasture; 1,649,960 were in farm woodland and the rest mainly in fruit.

Principal Agricultural Products of Florida, 1945 and 1944

Crop	1945	1944
Corn, bu. . . . .	6,900,000	7,190,000
Tobacco, lb. . . . .	20,413,000	20,008,000
Potatoes, bu. . . . .	5,285,000	3,445,000
Sugar cane, short tons. . . . .	1,111,000	970,000

The citrus production for the season 1944-45 and the estimates for 1945-46 respectively were as follows: oranges (including tangerines) 46,800,000 boxes and 54,000,000 boxes; grapefruit 22,300,000 boxes and 32,000,000 boxes.

On Jan. 1, 1945, the livestock resources of the state were as follows: 1,026,000 beef cattle; 133,000 milch cows; 609,000 swine; 22,000 sheep; 20,000 horses; and 35,000 mules.

**Manufacturing.**—The more important manufactures of the state in 1945 were lumber and naval stores (turpentine and rosin) and cigars. There was a great expansion of shipbuilding after 1940, much of it in connection with the war effort.

The cigars manufactured in Florida are valued at around \$21,000,000 annually. Tampa and Jacksonville are the leading cities in this industry.

Florida's lumber production, mainly yellow pine and cypress, in 1944 was 473,000,000 board ft. Estimated production for 1945 was 425,000,000 board ft. Tung oil and the production of paper pulp and the manufacture of paper and paper board were also important industries. Much of the wood pulp produced in Florida until well through 1945 went into the war effort.

In 1939, according to the U.S. census figures (1940), the state had 2,083 manufacturing establishments, paying \$37,823,204 to 52,728 workers and producing \$241,238,534 worth of goods.

**Mineral Production.**—Florida had only limited resources in minerals, but had large and rich deposits of phosphates, lime and limestone and less extensive, though highly valuable, deposits of kaolin and fuller's earth. The estimated value of the state's mineral production in 1945 was about \$15,000,000.

(J. M. L.)

**Flour and Flour Milling.** The International Wheat council, comprising representatives of the governments of Argentina, Australia, Canada, United Kingdom and the U.S., held its ninth meeting in London on Aug. 31-Sept. 1, 1945. It recommended, in view of a "gravely unbalanced demand and supply (world basis) situation in wheat, that the constituent governments take all steps necessary to ensure that the maximum amount of wheat is made available for human food, to discourage the use of wheat for feed (animal), and to maintain wartime extraction,"—i.e., 85% by weight of the wheat recovered as foodstuff flour.

**Enrichment of Flour.**—The enrichment of "green dot flour" (flour milled in the United States for foreign relief) was considered, but rejected by army authorities, "although it was regarded by leading nutritionists that flour enrichment was the most economical method of providing essential vitamins, from a transportation point of view. Army officials say that they could not pay the higher price for enriched flour on the basis of the army's responsibility to the American taxpayer."

The program of bread enrichment in the United States continued to meet with public as well as professional approval. A prominent medical journal stated, "The enrichment of flour and bread is considered particularly desirable because these foods are consumed daily by practically everyone."

In many states legislation was being drafted making enrichment of bread mandatory. Kansas State college stated that 75%

of the flour milled in the United States was enriched by the addition of the required quantities of thiamin, riboflavin, niacin and iron, even though in most cases this enrichment was not required by law.

**Legislation.**—A new flour packaging requirement that flour be packed and sold in uniform packaged weights of 100, 50, 25, 10 and 5 lb. became a law in the following 30 states in 1945: Alabama, California, Colorado, Florida, Georgia, Idaho, Illinois, Indiana, Kansas, Massachusetts, Michigan, Maine, Missouri, Nevada, New Hampshire, New Mexico, New Jersey, New York, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Utah, Washington, West Virginia and Wisconsin, which, together with the states of Kentucky, Nebraska and Texas passing the law in 1944, brought to a total of 33 the number of states enacting uniform package weight legislation.

**Economic Factors.**—The flour subsidy program (in the United States) would be—according to the office of the secretary of agriculture—the last of the supporting food subsidies to be abandoned. It was probable that the subsidy would be continued until June 30, 1946, when action by congress would be required to further extend this subsidy.

The bureau of agricultural economics of the United States department of agriculture in its survey of the problem of wheat surpluses, stated that, "Conditions in the United States are conducive to maintaining wheat acreage at current levels for 1946-47." Wheat disappearance for 1945-46 was estimated at 530,000,000 bu. for civil and military needs; for seed, 82,000,000 bu.; for alcohol, about 50,000,000 bu.; and about 120,000,000 bu. for feed on farms where grown. Total exports and purchases for feed were estimated at 360,000,000 bu. A carry-over of about 300,000,000 bu. was estimated for 1946.

The purchase of flour for military needs continued to be a significant factor in the flour market. According to Brig. Gen. J. E. Barzynski of the Chicago Quartermaster depot, the procurement divisions of the Chicago and California depots purchased 31,921,206 cwt. of hard and soft wheat flours for domestic and overseas uses between Jan. 1944 and March 1945. With regard to continued military requirements, it appeared that "army requirements will be met without interfering with an ample supply to provide for all civilian needs."

Average U.S. Retail Prices of Flour and Flour Products, Aug. 14, 1945

(Compiled by U.S. Bureau of Labor Statistics)

	Aug. 14 1945	July 17 1945	Aug. 15 1944	July 18 1944	Annual Averages * 1944 1943 1942
Flour, wheat . . . . .	6.4	6.4	6.5	6.5	6.5 6.1 5.2
Bread, white . . . . .	8.8	8.8	8.8	8.8	8.8 8.9 8.7
Bread, whole wheat . . . . .	9.7	9.7	9.6	9.7	9.7 9.8 9.5
Bread, rye . . . . .	9.9	9.9	9.9	9.9	9.9 10.0 9.7
Soda crackers . . . . .	18.9	18.9	19.0	18.9	18.9 18.0 16.4

\*Based on data from 51 U.S. cities prior to Feb. 16, 1945

Loans to farmers on wheat for milling purposes continued on an extensive scale. The Commodity Credit corporation, as of April 14, 1945, completed 136,165 loans on 183,231,850 bu. of wheat in the amount of \$251,982,723, for an average of \$1.375 per bushel. Loans were made on 48,000,000 bu. of wheat stored on farms, and 135,000,000 bu. stored in elevators and warehouses.

**Milling.**—The estimated capacity of the milling industry in the United States as of 1945 was, according to Herman Fakler, vice-president of the Millers National federation, approximately 300,000,000 cwt. per annum, including granular flour. Movement by rail of this quantity of flour would require 565,000 box cars, including about 165,000 cars required to handle the by-product mill feeds.

The problem of over-capacity in the milling industry was apparently being solved satisfactorily in the United States by

normal population increases. The disparity which existed prior to World War II between the ability of the industry to produce and the consuming demand has apparently been largely met by (1) abnormal wartime demands for flour and (2) a population increase of about 8,000,000 during the five years prior to July 1, 1945.

During World War II the production of granular flour for the manufacture of alcohol absorbed large quantities of wheat. At the peak of production 45 different mills were producing flour of this type, amounting to a total of 18,680,727 cwt. for the crop year 1944-45. During the later months of 1945 the milling of granular flour decreased sharply and, it was thought, might drop to about 5% of peak production—an amount which could easily be produced by a few mills.

Flour quality, as obtained from the milling of southwestern wheat of the 1945 crop, appeared to compare closely with the product of the 1944 crop obtained from the same area. Members of the American Association of Cereal Chemists, reporting on early shipments of wheat from Oklahoma and Kansas, observed from preliminary studies that test-weight (weight per bushel of wheat) tended to run high, but protein content slightly lower. The wheat milled well, producing flour of ash content and gluten quality comparable to 1944. In general, weather conditions in the central, western and southwestern sections of the United States were favourable to wheat growth during 1945.

In view of a substantial carryover of wheat from the previous year, and, since the spring wheat crop—estimated at 315,301,000 bu.—was the greatest crop in 17 years, it appeared that ample grain for flour milling would be available in the United States for 1945-46. (See also BREAD AND BAKERY PRODUCTS.)

**BIBLIOGRAPHY.**—*Southwestern Miller; Baker & Confectioner's Journal; Northwestern Miller; Bakers Weekly; Bakers Helper.*  
**FILMS.**—*Bread; Principles of Baking* (Encyclopædia Britannica Films Inc.). (H. E. BA.)

**Fluorspar.** The demand for steel during World War II led to increased requirements, in the United States in 1945, for fluorspar which were made even larger by other war uses. Hydrofluoric acid and its derivatives are used in the making of artificial cryolite, insecticides (DDT and aerosol bombs), refrigerating liquid (freon), and high octane gasoline. The important place which these products gained in the war program was expected to carry over to peacetime, and to lead to a continued high demand for fluorspar. The development of the industry during the war years is outlined in the table.

*Data of Fluorspar Industry in the U.S., 1940-44*  
(In thousands of short tons)

	1940	1941	1942	1943	1944
Shipments . . . . .	233.6	320.7	360.3	406.0	413.8
Imports . . . . .	11.9	7.5	2.2	43.8	87.2
Consumption . . . . .	218.5	303.6	360.8	388.9	410.2
Iron and steel . . . . .	160.1	214.7	250.4	241.4	238.0
Acid . . . . .	35.7	56.0	81.6	113.6	129.6

The production rate at the end of 1944 was well below the average for the year, and continued to decline in 1945. Shipments in the first ten months of 1945 totalled 286,787 tons, and consumption 309,256 tons. Imports remained high, the total for the first three quarters being almost as large as the total for the full year 1944.

Production figures for other countries for 1944 (and 1943) were limited to the following, in short tons: Canada 6,924 (11,210), France 14,137 (27,388), Mexico, exports, 62,225 (24,768), Newfoundland 65,308 (74,137), Spain 56,242 (39,585). (G. A. Ro.)

**Food and Drug Administration:** see DRUGS AND DRUG TRAFFIC; FEDERAL SECURITY AGENCY.

**Food Research.** In food research, as in other branches of science, interest in 1945 was keen to appraise wartime achievements for the purposes of peace. Principles discovered were expected to have permanent value, even if many of the applications had to be changed. For example, military demands for dehydrated products brought forth in the United States a forty-fold increase in the dehydration of vegetables and fruits. Processors started many new dehydration plants and expanded old facilities. They turned out, in 1945, dehydrated products much superior to those available before World War II; but only the future could tell if these products could compete successfully with fresh, canned and frozen vegetables and fruits.

In some respects World War II retarded progress in the commercial application of food-research findings—for example, the commercial development of quick freezing, which ran into shortages of equipment and manpower. Nevertheless, the research itself continued to advance. For example, the Pennsylvania Agricultural Experiment station developed a process for making a new frozen concentrated milk. Velva fruit, a frozen dessert, was another promising new product of research in food freezing; it utilized tree-ripened fruit, much of which was too soft for shipment. Gathered along with other fruit, and preserved by freezing until it can be processed, the ripe fruit is thawed, made into a puree, and refrozen, in which form it retains the original flavour, colour and nutritive value. Food-freezing research far outstripped commercial development facilities. Yet an increasing amount of food was being preserved by freezing.

Study of the vitamin A content of butter showed that milk and butter produced in the summer, when most cows are on pasture or other green roughages, are much richer in Vitamin A than milk and butter produced in the winter. The difference results largely from the difference in the carotene content of the summer and winter feeds. It was, however, prohibitively expensive for farmers to include enough high carotene feeds in the winter rations. Research workers were consequently trying to develop methods of harvesting, handling and storing summer feeds without loss of their carotene content. Other dairy studies showed that under certain conditions milk production per cow could be increased as much as 10% and butterfat production from 15% to 25%, or more, by administering synthetic thyroprotein to dairy cows. Feeding experiments with synthetic urea indicated a means of furnishing additional protein for milk production. Though urea contains no protein itself, it contains nitrogen, which the cow can combine with other feed constituents, to make protein in her body.

The Wisconsin station demonstrated the presence of cobalt deficiency in dairy cattle in the northeastern part of the state. Afflicted animals showed poor appetites, reduced milk production and lowered haemoglobin levels in the blood. Feeding cobalt sulphate at the rate of 1 oz. to 100 lb. of common salt gave spectacular results on the affected farms; the haemoglobin rose slowly, appetite and milk production were restored, and a generally bettered physiology resulted. Although polycythaemia can be produced in rats by too much cobalt, 50 mg. of this mineral per day—20 times the amount used in practice—did not induce this excessive production of red corpuscles in the blood of heifers. Similar findings had been reported earlier by the Michigan station as applying to various areas in that state.

A discovery important to farmers and fishermen was announced by Pennsylvania State college; it is a method for converting waste liquor from sulphite process paper mills into a valuable soil improver. Waste liquor poured into streams causes serious stream-pollution. It contains annually about 1,500,000 tons of lignin, a major constituent of the wood used in manufacturing paper. Added to soils, the lignin forms humus through precipitation by chemical and biological processes. This material, with certain harmful constituents removed, results (in freshly plowed ground) in the formation of water-stable granules or clods which render the soil more permeable to air and water, and consequently more suitable for crops.

Food research extends to the growing of food plants and livestock, as well as to the processing and distribution of food products. Soil differences affect plant and animal nutrition, and therefore indirectly affect human nutrition. Modern discoveries in nutrition emphasize the impor-

tance of mineral and other dietary essentials, which can vary widely in food crops according to their source. In many areas animals and human beings suffer from nutritional ills because the soils, and consequently the crops and livestock grown thereon, lack certain nutrients. Experiments and tests have indicated soil deficiencies in manganese, cobalt, copper, phosphorus and other minerals that play a part in nutrition. Genetic and climatic factors influence the food value of foods—for example, the vitamin content of tomatoes. Studies at Ithaca, N.Y., showed that the vitamin C content of tomatoes may vary as much as 60% according to the amount of sunshine they receive just prior to harvesting.

Reports by the United States department of agriculture in 1945 emphasized this and related aspects of food research. Investigations with regard to fertilizers included attention to nutritional results. So did studies of the effect of growing and harvesting methods on the quality of fruits and vegetables, and on their suitability for handling, preservation and transportation. Plant and animal breeding experiments sought to develop quality, palatability, vitamin content and other nutrition factors, as well as size, rate of growth and disease resistance. Food research influences the volume of production in many ways. One instance reported in 1945 was a new method of using preharvest hormone sprays to prevent the dropping of apples and pears. Adding carbowax (a polyethylene glycol) to naphthaleneacetic acid considerably increased the efficacy of the hormone in preventing preharvest fruit drop, and lengthened the duration of the effect.

Hydroponics or tank agriculture made progress, partly through experiments under United Nations military direction. The largest hydroponics installation was in 1945 on Ascension Island, an airway station in the South Atlantic. This British possession, called "The Rock," has no soil and no rain but plenty of cinders and ash. In 1945, it was providing more than 1,000 men with fresh vegetables every day from beds that occupied less than one acre of space. Cinders mixed with asphalt furnished material for making water-tight tanks seven inches deep. Partially shaded, filled with cinders, and saturated every second day with distilled sea water containing nitrates, potash, phosphorus, calcium and magnesium, these improvised growing beds produced excellent tomatoes, lettuce, radishes, cucumbers and peppers. Such vegetables cannot be grown successfully in the tropics by the usual methods. U.S. and British military forces cooperated in this experiment with the help of technicians who had developed hydroponics gardens in Florida and elsewhere. Other hydroponics gardens were being started on coral islands in the Pacific. Where soil is lacking or not free from dangerous contamination, hydroponics can be an efficient and safe method of supplying fresh foods.

Studies in the economics of nutrition yielded data of practical value, particularly in connection with malnutrition among low income groups. In the war years the nutrition of the lower income groups improved in the United States, in Great Britain, and in some of the other United Nations, in spite of difficulties occasioned by shortages of manpower, shipping and other necessities. But this improved average level of nutrition must be maintained. Needless to say, moreover, food consumption was not yet entirely sufficient even in the best-nourished countries. Over most of the world it was not nearly adequate, usually from sheer lack of production rather than from inequalities in distribution. But in the technically advanced countries the main trouble was on the demand side. Too many people could not afford good nutrition.

In 1941, according to figures published for the United States, urban families whose incomes per capita amounted to less than \$260 a year had to spend more than half their incomes for food. This is a very excessive proportion; it leaves far too little money for other essentials. The bureau of human nutrition and home economics said that in 1941 it would have cost about \$170 per person on the average to provide a low-cost minimum adequate diet for the low-income urban groups. In the entire urban population of the United States some 5,400,000 households or about one-fifth of the urban total could not have spent \$170 per person per year for food without allocating for that purpose more than 40% of their per capita incomes. Even 40% of the per capita income is excessive for food. Farm families spend less money for food than urban families, but they supplement their purchased food with home-produced food. Programs for improving the nutrition of low-income farm families emphasize the equal need of more production on the farm for use in the farm home and more cash income to buy necessary foods. Few farm families can produce all the foods they need.

Lower distribution costs could help to solve nutrition problems. After studying marketing margins and costs in the baking industry, the U.S. department of agriculture recommended some economy steps. The recommendations included prohibition of stale bread returns, an end to the practice of furnishing bread racks to retailers, and reductions in deliveries, in calls paid by bakery salesmen and in packaging costs. Distribution costs more for bakery products than for most other manufactured food products. Chiefly recommended as a remedy was elimination of highly competitive selling practices which entail avoidable costs. Profitable originally when used by only a few firms, these practices through general adoption had become burdensome. (See also DIETETICS.) (A. P. Cw.)

**Football.** One of the finest teams college football has produced, boasting the most devastating pair of backs of modern times in the U.S., dominated the gridiron in 1945, the fourth and final season of the war.

The team was Army. The backs were Felix (Doc) Blanchard and Glenn Davis. Blanchard, the fullback, was voted the Heisman trophy as the outstanding player of the year. Halfback Davis placed second in the balloting.

The West Point cadets, coached by Colonel Earl Blaik, finished the season with a perfect record, as they did in 1944,

extending their two-year string of victories to 18. This marked the first time Army ever went through two successive seasons without a setback.

In their final game, the cadets defeated their chief rival, Navy, by the score of 32-13. They scored 20 points in the opening period and then ran into their stiffest opposition of the year as Navy more than held its own for the remaining three quarters. The midshipmen from Annapolis were unbeaten up to this contest, though tied by Notre Dame.

A crowd of 100,000 filled the Philadelphia Municipal stadium for the game, which marked the return of the service classic there for the first time since their 1941 meeting a week before the attack on Pearl Harbor. President Truman and his family were in the vast assemblage. The cadets massacred Notre Dame, Pennsylvania, Duke and all other opponents, except Michigan, which made the best fight next to Navy in holding the West Point eleven to 28-7.

Navy, which defeated Pennsylvania, Duke, Michigan and Georgia Tech, among others, was generally ranked the second best team in the U.S., but in the final nation-wide poll of the Associated Press Alabama squeezed ahead of the midshipmen by 942 points to 941. Alabama went through with a perfect record, though it did not have too strong a schedule. Indiana was ranked fourth and then followed Oklahoma A. & M., Michigan, St. Mary's of California, Pennsylvania, Notre Dame and Texas.

Indiana, under Alvin (Bo) McMillin, won the Western Conference championship for the first time in the 46 years it has been a contender and went through unbeaten for the first time in history, though tied by Northwestern. Michigan finished second in the conference. McMillin was voted the coach of the year. Colonel Blaik was second in the balloting and Lou Little of Columbia was third.

Alabama won the Southeastern conference crown, paced by its great passer, Harry Gilmer. Duke took the honours again in the Southern conference. In the East, Pennsylvania, which lost only to Army and Navy, was ranked the best team after the service elevens and retained the honours in the ivy group. This group, which has no official champion, adopted an agreement, effective in 1946, barring athletic scholarships and imposing other restrictions to make their football the purest of the pure. Yale, defeating Princeton and Harvard, took the unofficial laurels in the Big Three. Columbia had its best season in years, losing only to Pennsylvania.

Missouri won the Big Six crown. Texas finished at the top in the Southwestern conference, Southern California in the Pacific Coast conference and Denver in the Big Seven.

Southern California got the bid to the Rose Bowl for the third year in a row and Alabama was chosen as its opponent in the game on New Year's day at Pasadena. Alabama was the winner of the classic by the score of 34-14, marking the first time the Trojans have ever been beaten at Pasadena.

Oklahoma A. & M., led by Bob Fenimore, defeated all opponents and was picked with St. Mary's to play in the Sugar Bowl at New Orleans. St. Mary's, which had one of the year's outstanding backs in Herman Wedemeyer, vanquished all opponents on its schedule until it was upset by U.C.L.A. in its final game of the season. The Sugar Bowl contest resulted in a 33-13 victory for Oklahoma A. & M.

Texas and Missouri met in the Cotton Bowl at Dallas. The game was won by Texas, 40-27.

For the Orange Bowl at Miami, the selections were Holy Cross and Miami university of Florida. Holy Cross, with one of the game's best backs in Stanley Koslowski, won from all opponents during the season except Temple. In the Orange Bowl the team from Worcester, Mass., lost to Miami, 13-6.

The 1945 season was marked by the return of numerous

war veterans to the campus to reinforce squads that had been made up in good part of freshmen and other inexperienced players. Many of these servicemen did not become eligible until the second half of the season began in November. At that time, also, there were shifts of navy personnel, with the result that some teams were weakened and others strengthened.

Among the returning war veterans who distinguished themselves on the football field were Pete Pihos of Indiana, Bob Evans of Pennsylvania, Meryll Frost of Dartmouth, Len Will of Columbia, Frank Barzilauskas of Yale and Dick Fisher of Ohio State. Frost, who spent 18 months in the hospital having plastic surgery done on his face after crashing in a flaming bomber in Italy, was the shining light of the Dartmouth team, whose coach, DeOrmond (Tuss) McLaughry, came back after serving as a major in the marine corps.

Numerous other coaches returned from the service in 1945. They included Dick Harlow of Harvard, Bernie Bierman of Minnesota and Wallace Wade of Duke, who served in an advisory capacity to Eddie Cameron. Bierman, one of the most successful coaches in the U.S. for years, found wartime football a different matter and Minnesota lost its last five games.

The coaches who had been away from the game for two or more years found upon their return that the T formation had supplanted the single wing and the Notre Dame box in popular favour. Among the teams who used the straight T, with its quick-opening plays, flankers, man-in-motion and man-to-man blocking, were Army, Navy, Notre Dame, Cornell and Yale. Many teams used a variation of the T, such as the wing-T or an unbalanced-line T, in conjunction with the single wing in most cases. These included Indiana, Columbia, Michigan, Ohio State, Colgate and Princeton.

The changes in the rules did not materially affect the style of football. The most important changes permitted forward passing from anywhere behind the line of scrimmage, as in professional football, and eliminated the out-of-bounds kick-off. Coaches were hard put to work out defenses against the T, and near the end of the season there was a trend to the use of the seven-man line with a diamond secondary, the defense for which Gilmour Dobie was harshly criticized a decade before as being behind the times. The six-man line was most widely in use and the five-man line was much in evidence.

The 1945 season saw most of the colleges that had dropped football resume full-scale varsity competition. They included Princeton, Vanderbilt, Baylor, Detroit, Oregon, Oregon State and Washington State. Harvard, starting informally, added Yale to its schedule after a two-year lapse of this ancient classic. Colleges that continued to remain out of the picture were Stanford, Fordham, Georgetown, Duquesne, Manhattan and Santa Clara.

Blanchard and Davis of Army topped all other players in national celebrity. Other backs who were named on most All-America teams were Wedemeyer of St. Mary's, Gilmer of Alabama and Fenimore of Oklahoma A. & M. Frank Dancewicz of Notre Dame, Pihos of Indiana, Koslowski of Holy Cross, George Taliaferro of Indiana, Clyde Scott of Navy, Ollie Cline of Ohio State, George Clark of Duke and Evans of Pennsylvania also were honoured.

The outstanding linemen were DeWitt Coulter, tackle, and John Green, guard, of Army; Warren Amling, Ohio State guard; Dick Duden, Navy end; Vaughn Mancha, Alabama centre; and George Savitsky, Pennsylvania tackle. Al Nemetz, Army tackle; Hubert Bechtol of Texas and Henry Foldberg of Army, ends, and Dick Scott, Navy centre were picked on some teams. Others honoured were Robert Ravensberg of Indiana, Max Morris of Northwestern and Bob Skoglund of Notre Dame, ends; Tom Hughes of Purdue, Tom Dean of Southern Metho-

dist and Jim Kekeris of Missouri, tackles, and John Mastrangelo of Notre Dame, Jim Carrington of Navy, Joe Dickerson of Penn and Jim Lecture of Northwestern, guards.

It was a big year for football at the box office. For the first time within memory, two games attracted 100,000 or more spectators each on the same day. At Los Angeles, 103,000 saw Southern California defeat U.C.L.A. while Army and Navy were playing before 100,000 at Philadelphia.

Attendance was generally up 35% over 1944. All-time records were broken in the Western and Southern conferences and for the biggest crowd in all Dixie for a regular season game. Michigan and Ohio State played to 85,000 fans at Ann Arbor, Army and Notre Dame to 75,000 in New York, and Navy and Notre Dame to 82,000 in Cleveland. Notre Dame, Michigan and Ohio State each drew more than 500,000 people, and Pennsylvania set a record at Franklin Field with 477,000. The Western conference drew 1,983,683 spectators, 172,303 more than the previous high mark of 1941.

**Professional Football.**—Professional football, too, had a highly prosperous year, even though the quality of the football was markedly below normal standard, as in college football. The New York Giants, badly weakened by losses of manpower to the armed forces, were eliminated early from the race for the championship but, nevertheless, had their best season at the box office. The Washington Redskins played to a sell-out crowd regularly at home. The play-off for the championship between the Redskins and the Cleveland Rams at Cleveland in freezing weather set a record with its gross of \$164,542.

The Rams, under a new head coach in Adam Walsh, centre on the famous Four Horsemen team of Notre Dame, were the surprise eleven of the National Football League. The Rams, with the prize newcomer of the year in Bob Waterfield, displaced the Green Bay Packers as the top team in the Western division while the Chicago Bears, formerly the scourge of the professional circuit, were badly weakened in the line and never were in the running.

In the East, the Washington Redskins came out on top, although the Philadelphia Eagles were rated the strongest in their division, if not in the entire circuit. The Giants killed off the Eagles' chances of winning sectional honours by overcoming their 21-0 lead to win by 28-21 on the passes of the ancient Arnold Herber. The following week the Redskins clinched the Eastern honours by clearly outplaying the Giants to win by 17-0 and did not have to rely on the passes of the renowned Sammy Baugh. In the play-off for the championship between the Redskins and the Rams, the Rams won by 15-14, to succeed the Green Bay Packers, as the new kings of the league.

In the final standing, the order of finish in the Eastern division was Washington, Philadelphia, New York, Boston and Pittsburgh; in the Western division, Cleveland, Detroit, Green Bay, Chicago Bears and Chicago Cardinals. Steve Van Buren of the Eagles set a league record in scoring 18 touchdowns and was high scorer for the year.

The Brooklyn team lost its grounds at Ebbets Field and merged for 1945 with the Boston Yanks. Before the end of the season a sensation was created when Dan Topping, owner of the Brooklyn club, joined forces with the new All-America conference, which was to begin operations in 1946. Topping, part owner of the New York Yankees Baseball club, negotiated with the New York Football Giants for a division of dates in New York, planning to put a team in the Yankee stadium in the National league.

When he was unable to make a satisfactory deal with the New York Football Giants, Topping jumped the National league and went over to the new All-America conference. His team was called the New York Professional Football Yankees, and the conference, established in New York at the stadium, loomed as a real challenge to the National Football league for public patronage. A football war between the two leagues, similar to the baseball wars of old, seemed to be in prospect.

**Canada.**—Football in the dominion was back almost on a prewar basis and the East-West playoff for the Grey cup was resumed after a year's lapse. The Big Four, the Intercollegiate, the Western Canada and the Ontario Rugby Football unions all were operating again, though the last two played shortened schedules.

The Toronto Argonauts won the Grey cup, emblematic of the dominion championship, by defeating the Winnipeg Blue Bombers in the play-off, 35-0. Ted Morris, former brilliant back on the team, was the new coach of the Argonauts and developed one of the strongest clubs Toronto has known. Behind a powerful, experienced line Argo had a set of fleet young backs, led by Joe Krol.

Krol signed with the Detroit Lions of the National Football league at the start of the season. His return to Canada and appearance in the Argonauts' lineup stirred up a heated controversy over the question of eligibility. He was finally declared eligible after a member of the Big Four executive committee had resigned.

The Argonauts earned the right to represent the East in the Grey cup play-off by defeating Balmy Beach, champions of the Ontario union. The University of Western Ontario, intercollegiate champion, declined to take part in postseason games.

Their victory over the Bombers gave the Argonauts their fourth Canadian championship in 13 years. The game was played in snow-flecked Varsity stadium in Toronto before 19,000 spectators. The passing of Krol and the running of Billy Myers, Royal Copeland, Fred Doty and Doug Smythe yielded six touchdowns, four conversions and a single. On the final play of the game Myers ran 70 yards for a touchdown.

(A. D.A.)  
Great Britain.—Wales was again outstanding in the Rugby union game

SGT. CHARLES TRIPPI of Georgia university, captain of the Collegiate All-Stars, has the ball in this play during the 12th annual all-star game. The Green Bay Packers, National Football league professional champions won the game at Chicago on Aug. 30, 1945, with a score of 19 to 7

in Great Britain in 1945, for it beat England twice, at Swansea and at Gloucester, and in each case fairly easily. England and Scotland had two very good games, and honours were easy. There was one superb game in the services competition—that between the army and the R.A.F. at Coventry. The army won by 18 points to 15. France surprisingly beat the army in Paris by 21 points to 9. But when the Frenchmen came to Richmond in April they were quite outplayed by a British empire side. Cambridge won both university matches, and the sevens competition was won by Nottingham, thanks to a brilliant display by Jack Heaton, the former Lancashire and England player. It was expected that the Twickenham ground would be reopened for the first time for the England and New Zealand match on Nov. 24. The best Rugby league sides were Bradford Northern and Halifax, and England beat Wales at Wigan.

In Association football England completed a splendid record for wartime football, its 29 matches against Scotland and Wales resulting in 19 victories and only 5 defeats. The last season opened with a grim struggle at Liverpool where England and Wales drew (2-2), and closed with rather a lucky draw for England against France at Wembley (2-2). The Frenchmen played excellent orthodox football, all in the best traditional English style. S. Matthews was as good as ever, and so was T. Lawton. The "find" of the year was Swift (Manchester City), who looked like becoming a great goalkeeper. Bolton Wanderers beat Chelsea in the cup winners' match at Stamford Bridge; Rangers beat Motherwell for the Scottish southern league cup, and Linfield beat Glentworth (4-2) for the Irish cup.

Great interest was aroused in the sporting world generally when a Russian Association football side paid a short visit to Great Britain in November. They were the Dynamos, the champion club of Moscow. They played four games—against Chelsea, the Arsenal, Cardiff City and Glasgow Rangers. Two they won and two they drew. Their football was quick, clever and clean, and the positioning and passing were in the best traditions of English Association football. In the first peacetime university matches Oxford and Cambridge drew the Association match and on Dec. 12 at Twickenham Cambridge won the inter-university Rugby match by one goal and two tries (11 points) against Oxford's one goal and one penalty goal (8 points).

(D. R. G.)

**Foreign Economic Administration.** The Foreign Economic Administration was created by executive order 9380 issued September 25, 1943, and represented a merger of several agencies whose functions pertained to international economic activities. The constituent agencies merged were: Office of Economic Warfare, Office of Lend-Lease Administration, parts of the Office of Foreign Relief and Rehabilitation Operations, and that part of the Office of Foreign Economic Coordination of the department of state that dealt with foreign economic operations. In addition, the functions of the War Food administration and the Commodity Credit corporation with respect to the procurement of food in foreign countries were transferred to the Foreign Economic Administration by executive order 9385 of

Oct. 6, 1943. The Office of Economic Warfare included certain corporations which were transferred to the office July 15, 1943: U.S. Commercial company was to engage in the acquisition, sale or carrying of strategic materials, principally to compete with enemy countries with respect to goods which might be of use to the enemy, and to engage in programs to rid the western hemisphere of axis and axis-influenced interests in the communications and related fields. After its integration in FEA, the company performed many of the FEA commercial operations, such as its regular foreign procurement program, and procurement abroad for the needs of liberated areas.

The Rubber Development corporation was authorized to perform all activities relating to the development of foreign rubber sources and the procurement of rubber in foreign countries.

The Petroleum Reserves corporation engaged in buying or otherwise acquiring reserves of crude petroleum from sources outside the U.S.

The Export-Import Bank of Washington aided in financing and facilitating exports, imports and exchanges of commodities between the U.S. and any of its territories or insular possessions and any foreign country and its agencies or nationals. In 1940 the bank was further granted authority to make loans to assist in the development of resources, stabilization of economies and orderly marketing of products of the countries of the western hemisphere.

By executive order 9630 of Sept. 27, 1945, the Foreign Economic Administration was terminated and its functions transferred to other agencies. Transferred to the department of state were all functions of the Administration and its agencies with respect to lend-lease; participation by the U.S. in the United Nations Relief and Rehabilitation Administration; activities in liberated areas concerned with supplying the requirements of these areas and procuring materials in these areas; the gathering, analysis, and reporting of economic and commercial information abroad; and the planning of measures for the control of occupied territories.

There were transferred to the Reconstruction Finance Corporation the Rubber Development corporation, the Petroleum Reserves corporation and the U.S. Commercial company, their functions, capital stock, assets and liabilities; and the functions

of the administration with respect to the procurement of commodities abroad, exclusive of such functions transferred to the department of agriculture.

Transferred to the department of commerce were all the functions of the administration and its agencies with respect to: export control; the Technical Industrial Intelligence committee; the facilitation of trade, including functions affecting foreign trade and domestic commerce and the functions of the Clearing Office for Foreign Transactions and Reports; and the final liquidation of the administration and those functions not otherwise transferred.

The functions of the Office of Foreign Food Programs and all other functions of the administration with respect to food, food machinery and other food facilities were transferred to the department of agriculture.

Liquidation of the lend-lease program at the end of the year was in the hands of the liquidation commissioner in the state department. The export-import functions and trade promotion activities of the Foreign Economic administration were performed in the newly created Office of International Trade in the department of commerce.

The functions of the Foreign Economic administration performed during the war may be described as follows:

(1) The administration of the Lend-Lease act, which included arranging for the procurement, purchase, and transmission of supplies, services and information to countries eligible for lend-lease aid and arranging for the receipt by the U.S. of reverse lend-lease aid from these countries. This was the major task of the administration, for lend-lease aid amounted to more than \$42,000,000,000 by July 1, 1945, and reverse lend-lease totalled approximately \$6,000,000,000.

(2) The procurement and development of vital materials abroad. This involved the location of strategic commodities needed in the war effort, development operations to increase their production and arranging for storage and transport. In the case of certain commodities such as quinine and manila fibre, it was necessary to find entirely new sources of supply to replace those lost to the enemy; in the case of other commodities, such as copper, although domestic production was great, war needs were greater, and it was found necessary to import almost one-third of U.S. requirements.

(3) Control, for war purposes, through export licensing and other similar methods, of the exports of all commodities from the U.S. Through these controls, supplies from the U.S. were prevented from reaching the enemy; what were needed for the U.S.'s own war effort and civilian requirements were conserved at home; and commercial exports were channelled to the fighting Allies and to other friendly nations producing supplies for U.S. war production.

(4) Assembly and analysis of information relating to the enemy war economy and to economic conditions within neutral countries for purposes of economic warfare, such as black lists, blockade measures, and preclusive buying, and to assist the military in strategic bombing and planning. The black list, officially known as the Proclaimed List of Certain Blocked Nationals, was a list of persons and firms, principally in neutral countries, found to be co-operating with the enemy. No export licences were issued to anyone on this list.

(5) The preclusive purchasing abroad of commodities which were of importance to the enemy for military or civilian needs and which otherwise might have fallen into their hands. These purchases supplemented the War Trade Agreements program, whereby, in return for permission to obtain through the Allied blockade essential supplies carefully limited to the needs of their own people, the neutrals were pledged to prohibit re-export to Germany of any of these supplies, or commodities similar

"END OF THE LINE." Aug. 21, 1945, marked an abrupt end to the flow of foodstuffs and other lend-lease materials from the U.S. Hal Coffman of the Ft. Worth Star-Telegram noted the troubled reaction of Allied nations who faced a hungry winter.

in nature, and to prohibit or reduce their exports to Germany of critical materials which they produced. Preclusive buying operations were conducted jointly with the British in Spain, Portugal and Turkey. The most important commodities in the preclusive program were the ferroalloys, tungsten and chrome and ball bearings.

(6) The provision of aid for relief operations in liberated areas. In 1944 and 1945 FEA was given the responsibility for the procurement of goods in the U.S. for the army's civilian relief program and for the United Nations Relief and Rehabilitation administration. In addition, FEA assisted the "paying governments" to obtain supplies in the U.S.

For a time, FEA was responsible for the disposal of goods declared surplus overseas, but that function was later performed in the office of the liquidation commissioner, department of state.

The FEA, through the USCC, undertook new activities in 1945 in connection with the facilitation of trade with liberated areas. For instance, importers who had difficulty in re-establishing contacts in western European countries could call upon the USCC to help them. A subsidiary corporation to USCC was formed to expedite shipments of copra from the Philippines. This organization was known as the Copra Export Management company and was composed of representatives of corporations which had formerly been engaged in the copra trade in the Philippine Islands.

The FEA was composed of two major bureaus—the Bureau of Areas and the Bureau of Supplies—together with a number of staff officers and the subsidiary corporations. The Bureau of Areas functioned on a country or area basis. It was responsible for FEA policies and programs relating to particular countries, and represented the agency in its relationships with those coun-

tries. It dealt with the state department with respect to clearing all programs in the light of the U.S. foreign policy; and it dealt directly with the representatives of foreign governments and supervised the foreign missions of the FEA.

The Bureau of Supplies was responsible for the execution of foreign economic programs on a commodity basis. Within the framework of the country or area policies, it regulated the flow of exports, both lend-lease and commercial, and executed foreign procurement and development operations. It was responsible for all related service functions such as warehousing, transportation and shipping, and represented the FEA on intra- and inter-governmental agencies engaged in the allocation of U.S. and world commodity resources. (R. W. T.)

**Foreign Exchange:** see EXCHANGE CONTROL AND EXCHANGE RATES.

## Foreign Investments in the United States.

Foreign investments in the United States were estimated at \$13,350,000,000 on April 30, 1945, an increase of roughly \$1,000,000,000 during the previous 12-month period. The major portion of the rise reflected a sharp increase in security prices although there were net foreign purchases of almost \$120,000,000 of U.S. securities, and publicly reported foreign short-term balances increased by \$77,000,000. The number of enterprises (direct investments) established or purchased by foreigners was smaller than in previous years and appeared to be limited to oil production and brewing.

As indicated in the accompanying table, the value of foreign investments in the U.S. had risen by about 35% from Aug.

Approximate Value of Foreign Investments in the United States,  
1939, 1941, 1945  
(In millions of dollars)

Type	Aug. 31, 1939	Dec. 31, 1941	April 30, 1945
Long term:			
Stocks and bonds*	3,450	2,650	3,950
Direct	2,200	2,150	2,300
Miscellaneous	650	650	600
Total long term	6,300	5,450	6,850
Short term	3,150	3,700	6,500†
Grand total	9,450	9,150	13,350†

The above long-term estimates would probably be raised considerably when the treasury department released the details of its survey of foreign property in the United States in 1941.

\*Includes estimated holdings of \$100,000,000 of United States, national, state and municipal securities.

†Includes an arbitrary estimate of \$500,000,000 of foreign holdings of U.S. currency in 1944. No attempt was made to estimate currency holdings for other years.

Sources: Long-term data from International Payments Unit, Bureau of Foreign and Domestic Commerce, United States Department of Commerce. Short-term data from the Federal Reserve Bulletin of various dates, as adjusted by the Department of Commerce.

1939 to 1945, last war year, after having declined by \$300,000,000 between the beginning of the war and the attack on Pearl Harbor. The decline in the early period was mainly the result of the sale of investments by the British and a weakening of security prices in general, offset in part by an increase in foreign banking balances. Between the time the U.S. became a belligerent and April 1945, security prices advanced rapidly, foreigners purchased \$175,000,000 of U.S. securities, and foreign balances increased by roughly \$2,300,000,000. The increase in the latter reflected, on the one hand, the large volume of U.S. wartime purchases of goods and services from foreigners and, on the other hand, the inability of foreigners to purchase commodities in the U.S. and to transport them overseas in the quantities that might otherwise have been expected. The increase in the value of long-term investments occurred in spite of the seizure by the United States government of perhaps \$200,000,000 of former axis properties. In addition to the investments noted in the table, foreign gold under earmark in the U.S. for official foreign account amounted to \$1,135,000,000, \$2,215,000,000 and \$4,133,000,000, respectively, on the dates noted for

1939, 1941 and 1945. This asset was generally not regarded as an investment regardless of geographic location, although considerable mobility existed in the movement of foreign official funds from short-term balances to gold, and vice versa.

During 1945 the administration of controls over foreign assets in the U.S. continued to be focused on enemy and enemy-controlled properties and those of other foreigners whose relations to the former axis powers were suspect. Under a division of functions first established in 1942, the responsibility for this control was shared primarily between the treasury department and the Office of Alien Property Custodian, until June 1945. In that month President Truman, in an executive order, authorized the Alien Property Custodian to seize German and Japanese cash, gold and securities in the U.S. These assets had been frozen during the war by the treasury's Foreign Funds Control division and according to press reports amounted to about \$220,000,000. The action was interpreted as a step toward the ultimate seizure and distribution of the assets to claimants against both countries. However, the disposition of these funds and the proceeds of the sales by the custodian of enemy-controlled enterprises in the U.S. remained a matter for congressional decision. It was generally recognized that the potential funds available from these sources—roughly \$220,000,000 of short-term assets, gold and securities, and \$235,000,000 of vested properties—would fall far short of meeting merely the claims resulting from damage to U.S. properties in both countries and the losses to U.S. investors in German and Japanese bonds.

Up to Nov. 1945 the custodian had offered for public sale the government's interest in about 20 of the 387 business enterprises seized by his office. Among those so offered during 1945 were two former meeting places of the German-American bund. One of these was the well-known Camp Nordland in Andover township, Sussex county, N.J. The custodian also took further steps to destroy the corporate structure formerly controlled by the giant German chemical cartel, I. G. Farbenindustrie. The cartel's indirect holdings of the class B common stock of the Winthrop Chemical Company of Delaware, an important manufacturer of chemical products, were sold to the Sterling Drug, Inc., of Delaware, under terms that virtually prevented its return to German control after the war through "fronts," "cloaks," or other devices. At the time of the transaction the attorney general pointed out that after World War I this same property had been sold by the Alien Property Custodian to the U.S. but that it had ultimately found its way back to I. G. Farben interests. To prevent the recurrence of this experience he had recommended that restrictions be placed on the transfer of title or control of the shares.

The custodian also noted that prior to World War II, axis concealment of the true ownership of some U.S. firms had been exceedingly skilful. Indeed, in one case, it was so successful that the U.S. managers of the American Potash and Chemical corporation apparently had not known that German concerns were the beneficial owners of the company. The company was an important producer of varieties of potash, chloride, borax and other chemicals used in the manufacture of many military explosives, armour plate, ordnance articles and instrument glass used in bomb sights and gunnery fire-control devices.

In his second report, released in 1945, the custodian noted the following among the contributions to the war effort by firms he was liquidating.

Among the assets of business enterprises now in liquidation the Alien Property Custodian has discovered a variety of pieces of property which have proved to be of direct assistance in the prosecution of the war. The following are examples:

(1) A scale model of the Fiat plant at Turin, Italy, was found among the records of the Fiat Societa Anomina and turned over to the U.S. army intelligence service. It is understood that this model was used in plans for bombing the plant, which manufactured aeroplanes for the axis.

(2) Three large-scale maps showing in minute detail the cities of Osaka, Nagoya and Yokohama, Japan, were found among the property of Japan Products Co., Inc., and turned over to the U.S. army intelligence service.

(3) The files of the U.S. branch of the huge Japanese firm of Mitsui and Co., Ltd. contained a large number of books, maps, plans, specifications of machinery, etc. This material has been searched by the proper authorities and has yielded valuable information.

(4) The books and pamphlets found in the stock of Gosha-do, a Japanese book store, proved of great value to the war effort. Different items from this collection have been used by the Office of War Information, the army, the navy and the Office of Strategic Services.

(5) Two Japanese typewriters were among the assets of the Pacific Trading company. These typewriters were handed over to the U.S. army intelligence service and on the day following their receipt they were flown to General MacArthur's headquarters where, this office is informed, they have proved most useful.<sup>1</sup>

After the war with Japan had been won, the custodian announced that there was a substantial amount of vestible Japanese-owned property in the Philippine Islands and that he had established a branch office there. The major part of the Japanese assets was believed to consist of plantations in the Davao area, and there was also some cash that could be taken over. Several times during 1945 the custodian's office extended the time limit within which any person, except a national of a designated enemy country, might file a notice of a claim arising as a result of a vesting order. In November the deadline was extended to April 1, 1946, in order to protect the equity of prospective claimants.

The treasury department took two important steps during the first ten months of 1945 designed to free friendly funds from its control. The first lifted all liberated areas out of the category of enemy territory and the second, relating solely to France, suggested a pattern that might be applied to the assets of nations of other overrun Allied countries. These involved the lifting of the treasury's import and export controls over payments to and from blocked countries, and, in the case of France, released French assets (mainly banking balances, bullion and securities) in the U.S. from the treasury's jurisdiction. The complete release of the latter, however, was dependent upon certification by the French government that such assets were in fact French owned, although the U.S. reserved the right to join in the clearance of individual accounts. The certification requirement provided the French government with an opportunity to check the beneficial ownership of all property and to prevent the release of property which was held in French names but was actually enemy owned. At the time of the announcement the French government expressed the conviction that the treasury's freezing controls had placed a disadvantage on the enemy by preventing him from looting these assets while at the same time preserving them for the French people. A defrosting procedure similar to the one relating to French assets was applied to Belgian assets in Nov. 1945. (See also EXCHANGE CONTROL AND EXCHANGE RATES.)

**Foreign Trade:** see INTERNATIONAL TRADE.

**Forests.** To determine the amount of timber standing in the forests of the United States, current rates of growth and drain, the condition of forest lands and methods of management, the U.S. forest service in 1945 began a reappraisal of the forest situation in the U.S. Completion of the project was not expected before 1946. There was little doubt, however, that it would show that serious depletion of growing stocks had occurred in certain areas as a result of heavy demands during World War II, and that timber was being taken from the forests of the U.S. faster than it was being replaced by new growth.

The problem of decreasing forest resources is world-wide,

<sup>1</sup> Annual Report, Office of Alien Property Custodian, fiscal year ending June 1944.

according to a report of the Technical Committee on Forestry and Primary Forest Products of the United Nations Interim Commission of Food and Agriculture, issued in 1945. Despite the fact that forests can be managed to provide ample wood supplies and vastly increased social benefits, according to the report only 15% of the world's timberlands are being handled as a renewable and productive resource. The committee estimated that two-thirds of the world's forests receive neither care nor protection.

"Among the world's raw materials, wood ranks second only to food," the report said. "Forests are the economic backbone of some of the world's most advanced prosperous nations. . . . Over 90% of the world's annual wood harvest is retained for domestic consumption, yet the remaining 10% has reached third place in value among all commodities entering international trade. . . . In the face of rapidly multiplying uses for wood which create ever-mounting wood needs, the world is confronted by the inescapable fact that the forests—sole source of wood—are steadily diminishing."

The technical forestry committee, under the chairmanship of Dr. Henry S. Graves, dean emeritus of the Yale school of forestry, included representatives of Great Britain, Canada, the soviet union, France, Norway, Brazil, Czechoslovakia, China and the U.S.

To meet the problem of the destruction of forests by war and the enormous prospective need for wood following the war, the committee urged international action in the collection and unification of forestry statistics as a first step in balancing the world's forestry budget and planning its expansion. The United Nations organization, it stressed, should undertake to aid member nations in the development of techniques in growing, harvesting and utilization of wood products, and research into the values of thousands of tree species still of unknown quality.

The importance of wood in World War II brought the forest products laboratory, maintained by the U.S. forest service at Madison, Wis., into the forefront among technical war agencies. Many new products and processes, developed to meet war needs, held promise of creating new industries in the postwar years. Laminated wood, improved plywoods and wood and paper base plastics were finding an increasing variety of uses. Such laboratory developments as "impreg," "compreg," "papreg," "staypak" and the "uralloys," were receiving growing industrial recognition. Technical information had been developed upon which could be based an industry for the production of industrial alcohol from wood waste on a scale sufficient to meet any conceivable demands.

From logging to finished lumber products, about two-thirds of the average tree is wasted. The forest service postwar research program gave special attention to measures that would make profitable the utilization of material now wasted. Foresters urged the development of diversified manufacture so that in a given locality the waste or by-product of one plant would become the raw material of another. More complete utilization of the forest crop, the forest service said, would help in some measure to close the gap between annual growth and drain.

Japanese balloon bombs presented a new threat to forests of the western U.S. in the early months of 1945. Scores of balloons carrying incendiary bombs were released in Japan to be driven by prevailing westerly winds to the North American continent. The forest service and co-operating agencies initiated special protection measures, including the expansion of its "smoke-jumper" corps (parachuting fire fighters) who could be delivered quickly to fires in inaccessible areas. Although the balloon barrage lasted several months, no serious fires resulted.

In 1944 acreage burned by forest fires in the U.S. was held to a little more than one-half the annual average of the preceding

five years, and during the first half of 1945 it looked like this favourable record might be repeated. In the late summer months, however, there were many serious fires in the western states. The year's most disastrous fire occurred in Tillamook county, Oreg. This fire raged for nearly two months, despite the efforts of several thousand fire fighters. It spread over 130,000 acres, covering much of the same area burned by the big Wilson river fire of 1933, and completing the devastation of what was once one of the finest Douglas fir timber areas of the Pacific north-west.

By June 30, 1945, the forest service, in co-operation with state forestry agencies, had set up 100 forest farming and farm woodland marketing projects, covering 403 counties, under the Norris-Doxey Farm Forestry act of 1938. Forty additional farm forestry projects were transferred from soil conservation service to the forest service in July. In each project the services of a trained forester were made available to woodland owners to provide technical advice and assist in working out woodland management and marketing problems. Farm forests occupy 18% of all land in U.S. farms and furnish approximately one-third of the country's timber cut. In general, however, farm woodlands are producing one-third to one-half of what they could, under improved forestry practices.

Books and pamphlets on forests and forestry published in 1945 included *Behold Our Green Mansions*, by R. H. D. Boerker (University of North Carolina Press); *Your Forests*, by Martha B. Bruere (Lippincott); *Careers in Forestry* and *Let's Talk About Timber Supplies* (U.S. department of agriculture).

(C. E. R.)

**British Empire.**—The year 1945 represented a turning point in empire forestry. For nearly six years the efforts of all empire foresters had been devoted to producing the munitions of war, and now came a somewhat sudden change over from wartime to peacetime demand. Nevertheless, in spite of reduced staff, in all forest departments there was thought for the future and in many parts of the empire plans for postwar forest policy were drawn up. One result of the war was to draw the attention of governments more closely to the importance of a settled forest policy in which forestry, both protective and productive, must take its rightful place with other forms of land use. With this it was hoped that the great importance of stocktaking as a preliminary to systematic management would not be overlooked. In many parts there had been considerable overcutting of the sustained yield even before the war. Stress was being laid not only on the necessity for an adequate percentage of land under forests, but also on the distribution of such land to meet demands for forest produce.

With the end of the war in the far east, the important forest areas of Burma, Malaya and the East Indies were freed and early reports tended to show that the main forest areas had suffered very slightly. There had been, however, considerable wanton damage in the more accessible forests owing to the lack of control during Japanese occupation.

In Canada and Australia the war emphasized the value of their forests and, in Canada especially, attention was directed to the more complete utilization of the crop.

In many parts, especially South Africa, South Australia and New Zealand, the forest policy of large plantations of exotics had been more than justified and during the war these countries had to rely mainly on fellings and thinnings in their young plantations.

(H. R. Bd.)

Figures available from South Africa in December showed that the output of coniferous plantations in the union had increased from 2,000,000 cu.ft. in 1937-38 to 17,000,000 cu.ft. in 1944-45. During a most critical phase of the war these areas had supplied more than half the softwood requirements of Africa.

**Great Britain.**—The year 1945 marked the launching, with the beginning of a new planting season on Oct. 1, of the forestry commission's postwar program put forward in June 1943. This aimed at an eventual increase of Britain's forested areas to 5,000,000 ac. within a 50-year period. Within the first decade it was proposed to replant 600,000 ac. of felled or neglected timberland and plant 500,000 ac. of hitherto bare land. Towards this the first year was to contribute 10,000 ac. of replanting and 25,000 ac. of planting.

On Nov. 30 the minister of agriculture announced that parliament would be asked to replenish the forestry fund by a total sum of £20,000,000 during the financial years 1946-50. This amount should provide for the afforestation and replanting of 365,000 ac., allow for additional land for future planting and for ancillary services, and, where necessary, provide modern, up-to-date houses for workers in state forests.

An important item of policy, which the government accepted, was the dedication scheme submitted by the forestry commissioners. Under this, owners of private woodlands, in return for recommended scales of state assistance, would undertake to "dedicate" their lands to timber production on approved lines. Should there be refusal to co-operate in this way, the land might be compulsorily acquired. Increased facilities for education, training and research into all branches of the work, including timber utilization, would be associated with this large development program.

**Formosa** (TAIWAN), a Japanese colony from 1895 until 1945 and restored to Chinese sovereignty after the Japanese surrender in 1945, is a large island in the western Pacific, separated from China to the west by the Taiwan straits and from the Philippines to the south by the Bashi and Balintang channels. Under Japanese rule the Pescadores (Bōkotō) and other outlying islands formed a political division of the Taiwan government-general. Area 13,429 sq.mi.; pop. (1940) 5,872,084. Most of the inhabitants of Formosa are of Chinese stock and are ethnically related to the Chinese of the neighbouring mainland province of Fukien.

Capital, Taihoku (326,407, census of 1940) in the northern part of the island. Other large towns: Tainan (142,133), Takao (152,265); Keelung (Kirun) (100,151).

**History.**—No details of the plans for Chinese administration of the island were available at the end of 1945. The last Japanese governor-general (appointed 1944) was Admiral Kiyoshi Hasegawa. Formosa was of considerable strategic importance for the Japanese program of southward expansion. A large naval base was maintained at Mako, in the Pescadores. Formosa served as an advanced base for the Japanese invasion of the Philippines in 1941. It was bombed periodically by U.S. planes but was by-passed in the course of the advance to the north and was not invaded before the Japanese surrender in Aug. 1945.

**Education and Economics.**—There were 143 primary schools, with 1,108 teachers and 43,671 pupils for the Japanese, and 788 schools, with 7,242 teachers and 445,396 pupils for the natives in 1937. Japanese was the language of instruction. The Formosan budget was 183,014,971 yen in 1938-39 and 260,530,226 yen in 1939-40 (the yen was officially valued at 23.48 U.S. cents before the beginning of the war in the Pacific). Overseas trade, almost entirely with Japan and its colonies, amounted to 592,938,000 yen (exports) and 408,650,000 yen (imports) in 1939. Formosa is one of the world's chief sources of camphor, and there were government monopolies of camphor, salt, opium and tobacco.

LOW-FLYING medium U.S. bombers released the bombs shown floating down on parachutes during a raid in 1945. Their targets were trains in the yard at Chickunan, Formosa

There was a record sugar crop of 2,364,550,976 *kin* (the *kin* is approximately one and one-third U.S. lb.) in 1939. The rice crop increased from 330,000 tons in 1899 to about 1,600,000 tons in 1938. Tea and jute are other products, and the island contains deposits of gold and iron. There were 646 mi. of government and 317 mi. of privately owned railways in Formosa in 1937 besides 1,246 mi. of industrial railways. There were 217 telegraph offices, with 734 mi. of line and 2,946 mi. of telephone lines.

There were 633,053 savings bank depositors in 1937, with deposits of 27,136,748 yen. (W. H. CH.)

**Forrestal, James** (1892- ), U.S. secretary of the navy, was born on Feb. 15 in Beacon, N.Y. He studied at Dartmouth college, 1911-12, and at Princeton university, 1912-15. He enlisted in the U.S. navy in 1917, and was assigned to its aviation force. He trained with the royal flying corps at Toronto, Canada, and was made an ensign in Nov. 1917. Forrestal resigned from the navy with the rank of lieutenant in 1919, and resumed an earlier connection with Dillon, Read and Co., a Wall street banking firm, becoming its president in 1937. In Aug. 1940 he became undersecretary of the navy, serving in that capacity until the death of Secretary Knox, whom he succeeded on May 19, 1944. Forrestal was an advocate of a large postwar navy and the peacetime draft. He aroused the ire of some Republican congressmen when he declared (Sept. 8) that publication of facts not disclosed in the Pearl Harbor reports would "compromise sources of information . . . of great value to our national security." He actively opposed the measure to unify the armed services under a civilian secretary.

Forrestal offered (Nov. 28) a substitute plan which provided for a permanent national security council which would include joint chiefs of staff for the armed services and a "chief of staff to the president."

**Foundations:** see DONATIONS AND BEQUESTS. See also SOCIETIES AND ASSOCIATIONS.

**Four-H Clubs.** Approximately 1,700,000 rural young people in the United States between the ages of 10 and 21 years were members of 4-H clubs in 1945. A rededication of their "heads, hearts, hands and health" toward the goal of final victory for the nation characterized the attitudes and achievements of these members, guided by the 175,000 local volunteer leaders, under the direction of county extension agents co-operatively employed by the United States department of agriculture, state colleges of agriculture, and county extension organizations.

The year 1945 marked the culmination of the greatest period of accomplishment in 4-H club work. In keeping with the 4-H seven wartime goals, club members produced and conserved, after Pearl Harbor, enough food to feed 3,000,000 fighting men for one entire year, as a part of their work in gardening, in raising crops and livestock, and in conserving the surplus. They collected thousands of tons of scrap for war purposes. They bought or sold to others more than \$400,000,000 in war bonds and stamps. Throughout the war, they increased their efforts to improve their own health and that of their homes and communities. They helped to conserve needed farm and home supplies and equipment. They gained a deeper appreciation of the democratic way of life by practicing democracy more intently as they met together for mutual help and for service to others. At such meetings, through discussions of some of the important social and economic forces at work, they gained also a deeper appreciation of the good neighbour spirit at home and abroad and the steps to take in building a just and enduring peace.

Because of wartime conditions, the only national 4-H event held in 1945 was the 24th National 4-H Club congress at Chicago, Ill., Dec. 2-6. The ten 4-H club guideposts were launched in accordance with the general theme, "4-H in a Changing World." These guideposts were planned to help 4-H members to analyze their own situations, needs and interests in the new atomic-energy age to the end that they might participate in building programs which would more adequately prepare them for citizenship, physically, mentally and spiritually. These ten 4-H guideposts were: (1) Developing talents for greater usefulness; (2) Joining with friends for work, fun and fellowship; (3) Learning to live in a changing world; (4) Choosing a way

to earn a living; (5) Producing food and fibre for home and market; (6) Creating better homes for better living; (7) Conserving nature's resources for security and happiness; (8) Building health for a strong America; (9) Sharing responsibilities for community improvement; (10) Serving as citizens in maintaining world peace.

(M. L. W.)

**France.** Fully liberated in 1945, France is situated in the west of Europe; bordered north by Belgium and Luxembourg, northeast by Germany, east by Germany and Switzerland, southeast by Italy and south by Spain; with the Mediterranean sea on its southeast coast, the Atlantic ocean on the west and the English channel and the North sea to the north. Capital, Paris; government, a republic; president of the provisional government, elected by the National Constituent assembly, General Charles de Gaulle. Area, 212,736 sq.mi.; territory liberated from the Germans after V-E day included a narrow stretch of eastern France in Lorraine and small pockets in Alsace, as well as four small coastal areas along the Atlantic. Population (1936 census) 41,197,056, but probably reduced by approximately 1,000,000 in consequence of war and postwar deaths resulting directly from World War II. Of the 2,300,000 prisoners of war, forced labourers and political and racial deportees, all survivors had been returned by the end of 1945. Language: French; religion: Catholic; c. 1,000,000 Protestants.

**History.**—The year 1945 was memorable for the final liberation of all French territory in Europe and the empire from the axis enemies; the restoration of republican practices and institutions, including bitter political strife; the political but not yet constitutional establishment of the Fourth Republic; the persistence of great material hardship, together with pronounced but spotty economic recovery; revival of free cultural activity; abandonment of France's historic role as dominant diplomatic power in Europe and the assumption of a new policy of serving as the point of equilibrium between the United States (and Great Britain) in the west and the soviet union in the east; and continued diplomatic efforts to advance the French thesis that the Rhineland and the Ruhr must be detached from future German political and military control. These achievements and aspirations are discussed in detail below.

**Political-Constitutional.**—France made great headway during the year 1945 in scrapping what was left of the antirepublican Vichy apparatus of government and the emergency legislation and regulations of the early liberation period. The outstanding political developments were the series of free and open elections in October. For the first time in French history women had the vote. At the spring elections for the municipal councillors of more than 35,000 communes (corresponding roughly to the townships and villages of the U.S.), more than 20,000,000 French men and women turned out at the polls. In the popular vote the parties of the Left won 60% of the total vote cast, their gains being most pronounced in communes having a population of 4,000 or more. But the Centre and Right parties carried most of the smaller communes, especially the rural, and obtained control of substantially more than 70% of all the municipal councils in the entire country. Hence, while the election definitely forecast the renewal of the trend toward the Left which had begun in 1932, nevertheless so far as local government was concerned, the political fulcrum still rested right of centre.

The same trend toward the Left was revealed in the cantonal elections, held several months later, for the members of the general councils of the departments. The great winners were the Socialist candidates, while the Radical Socialists suffered the most severe losses. The latter, notwithstanding their misleading name, are neither radical nor socialists; they are the

great, traditional middle-of-the-road party broadly representative of the interests of the peasant proprietors and the petty *bourgeoisie* of trades, crafts and the liberal professions.

The general election of October 21, 1945, was the most important of the three, and the first of its kind after the general elections of 1936 which had returned the Popular Front to power. First, the voters elected deputies to the first regularly elected national assembly in nine long years. The Provisional Consultative assembly, instituted at Algiers in the fall of 1943, had passed into history two months earlier. Composed of nominated deputies representing the Resistance and the anti-Pétain wings of the old political parties, it had served its country well as an interim guardian of the legislative republican tradition; but its role was ended. Secondly, the voters had to vote "yes" or "no" on two very important questions of a referendum: (1) whether or not the new national assembly would at the same time be a constituent assembly, *i.e.*, be empowered to draft a new constitution to replace the 1875 constitution of the Third Republic; and (2) if the verdict were "yes," whether or not the country would accept the plan originally drawn up by De Gaulle but modified by the Consultative assembly to regulate the relations between the new assembly and the executive branch of the government. As De Gaulle had originally worded the second question, the new assembly would not have been sovereign. As finally modified by the Socialist party under Leon Blum's inspiration, it incorporated the responsibility of the government (De Gaulle and the cabinet), at least after a fashion, to the assembly.

Since even the modified definition of relations had been rejected for entirely different reasons by the communists on the Left and the radical socialists on the Right-Centre, the second proposition was in a sense a test of General de Gaulle's standing in the minds as well as in the hearts of his countrymen. Conversely, the voting on the first proposition was actually a way of determining whether liberated, post-Resistance France would go forward and establish a Fourth Republic, or firm in its traditionalism, march backward to a patched-up Third Republic.

More than four-fifths of all registered voters went to the polls. The result seemingly was convincing proof that the France of 1945 had turned its back upon the institutions, the leaders and the conservative defeatist spirit of the republic which had committed moral suicide at Munich before collapsing in shattering physical defeat in 1940, since the voters gave an overwhelming, almost unanimous "yes" to the first question of the referendum. Thus the most important task of the assembly was to draft a new constitution. To the second proposition the voters gave a more than two-to-one affirmative reply. This was a tribute to De Gaulle all the more amazing in that the opposition to his proposal was systematically and strongly organized. It was at the same time a highly disturbing symptom of political division, for the 33% "no" vote, largely Communist, was a powerful protest against the danger of one-man rule as represented by De Gaulle and also an attack on the Vichy economic bureaucrats whom he was keeping in office.

Of the 586 seats in the assembly, 435 were won by three great parties of the Left, the Communist (152), the (Catholic) Popular Republican (151) and the Socialist (132) in the order named. If the rise of the Communist as the leading party, with 27% of the total vote, was surprising, the success of the Resistance-born Popular Republicans was astonishing, even to themselves. The Radical Socialist, for years the dominant political party of the Third Republic, was decimated; and the vote cast for the parties of the Right was negligible. The new assembly, which held its first session on Nov. 6, 1945, was predominantly a young body, the average age of the deputies being in

A DP (displaced person), one of millions of foreigners in Germany liberated during 1945, returns to his village at Annoeulin, France. Released by U.S. troops after five years of imprisonment, he cycled, hitchhiked and rode freight trains on the 400-mile journey home

the middle thirties. Thirty-two women sat in its midst. The colonies too were represented. It included 86 professors and teachers, 59 white-collar workers, 43 journalists and 36 farmers. It was young France, the France of the Resistance and post-liberation. But De Gaulle still towered over the parties.

Thus the political line in France in 1945 was no longer drawn between the Left and the Right; it divided instead the three parties that nominally were of the Left, though it was not sure how Left the Popular Republicans actually were. The points of agreement among them were many. They all accepted the social principles laid down in 1944 by the National Council of Resistance. They stood resolutely against everything that smacked of the Vichy administrative practices. They were stalwart defenders of the individual liberties of thought, expression and conscience. They subscribed to the ideal of social and economic democracy. They all believed in a strong international organization. But agreement ended there, since they started from conflicting principles and disagreed vehemently over methods. The Communists and, to a great extent the Socialists, advocated and agitated for a sweeping program of nationalization of economic enterprise; the Popular Republicans—most of whom were Catholics in religion and not a few former conservatives in politics—opposed what they called the materialistic and extremist policies of the Marxist parties. Their left wing wished the nationalization of selected monopoly industries, and within such publicly controlled and administered ventures the maintenance of freedom of initiative and personal responsibility. But their right wing members were keen defenders of private property who would keep a large sector of French economy free for private enterprise without state control or supervision. They endorsed the ideal of a secular state and the lay school, but they reserved themselves the right during the constitutional debates which were forthcoming to argue the question of Catholic schools and state subsidies. That was not all. Whereas the Com-

munists were anxious to have the new constitution (which the assembly was to draft within a period of seven months from the election and then submit to a national referendum) provide for a strong single chamber and a weak executive, the Popular Republicans, who were enthusiastic hero worshippers of De Gaulle, demanded a stronger executive with scant opportunity for the chamber to overthrow the cabinet. A strong one-chamber parliament seemed to be favoured. Finally, on foreign policy, the Popular Republicans (and most of the Socialists) were in favour of a pact with Great Britain and the creation of a "western bloc," while the Communists, whose enthusiasm for soviet Russia ran high (too high in the opinion of De Gaulle and many other Frenchmen), opposed this development out of fear that it would line up western Europe, with the United States behind it, in an unfriendly coalition against the soviet union. These currents and cross currents buffeted the Socialists more than the other groups. As the key party, the Socialists faced both ways: some of them looked to the Communists, and an equally important section had friends and ties with the Popular Republicans.

These differences were not easily to be composed, and parliamentary clashes were to be expected. In these circumstances it was not surprising that Frenchmen in 1945 looked anxiously into the future and feared that the outcome would be a swing to an authoritarian regime. By the end of 1945 the France of the Fourth Republic had weathered one great political storm, and De Gaulle had gained his first major victory over the Communist opposition. On Nov. 13 he was elected president of the provisional government by the unanimous vote of the assembly. But he broke almost immediately with the Communists, when he refused to give them one of the three cabinet posts, foreign affairs, war or interior, which they claimed as the largest party in the assembly. In taking his stand he also made an appeal to the nation which the Communists strongly resented as a reflection on their patriotism. Although he proffered his resignation, the assembly re-elected him, this time the Communists voting against him; and within a few days he worked out a compro-

mise solution which salved the wounded feelings of the Communists without, however, giving them the desired cabinet positions. In his cabinet of national unity each of the three leading political parties received an equal number of posts. The Communists obtained the key ministries dealing with economic matters, the Popular Republican, Georges Bidault, kept the ministry of foreign affairs, the Socialist, Adrien Tixier, retained the ministry of the interior, while De Gaulle himself, in addition to being virtual premier, became defense minister, naming a Communist as one of his four subordinates.

Apart from these political and constitutional developments, the most spectacular happenings in domestic policy were the treason trials of Marshal Henri Petain and the former premier, Pierre Laval. After a drawn-out and dreary trial in which most of the prewar political leaders appeared for the prosecution, and unloaded responsibility for defeat on Petain, the high court found Petain guilty of intelligence with the enemy (Aug. 15, 1945) and sentenced him to death. But De Gaulle accepted the court's recommendation that the sentence not be carried out, and accordingly commuted it to life imprisonment. Two months later, after a brief, melodramatic trial, Laval was sentenced to death by the same court. He attempted to commit suicide, but was revived by physicians long enough to be executed by a firing squad. Late in the year the government did away with all special provisions for the trial of indicted collaborators, a measure which only aggravated the complaints of the former Resistance press that the purge and treason trials were being hamstrung.

*Economic.*—French economy in 1945 improved over 1944, but progress was slow and spotty. Prices continued to rise, and the black market remained a cheerless reality. War and disease had cut heavily into the population. The death rate for children, according to estimates, rose 50% above 1944. Tuberculosis was up 40% after the end of World War II, particularly in the 25-29 age group. Twenty per cent of teen-age children were undernourished. Once again the French people faced a cold and hungry winter. The greatest shortages were coal, raw materials and new machinery, food, skilled manpower (even though supplemented by German prisoner of war labour), timber for building and facilities for rail and water transportation. More than anything else, coal was lacking. Domestic production was up sharply, but France had always been dependent on coal imports. The nonarrival of expected imports from the United States and the expected reparations quota from the Ruhr mines slowed up the entire pace of industrial activity. Drastic restrictions were in force on the private consumption of coal and electricity, and many industrial enterprises were running only three days a week.

A few selected figures will serve to illustrate both the difficulties and the progress. Railroad traffic, while still far below normal, made considerable gain: 1,550 mi. of war-damaged tracks and hundreds of bridges were repaired; 7,800 locomotives were in use versus the 2,900 available in 1944; passenger-mile traffic increased tenfold; 2,000,000 tons of traffic cleared the ports as against 40,000 in 1944. Rebuilding and new construction were only in the blueprint stage, although the government was hopeful that its carefully drawn program would be implemented in 1946, because in none of such important activities as steel, electricity, textiles, shoes, chemicals, or glass had increased production reached the half-way mark of prewar figures. Least pronounced of all was the recovery in agriculture, where for lack of fertilizers, machinery, livestock, fodder and manpower, and because of mined fields and heavy drought, the situation was desperate. The wheat crop alone was estimated at little more than half of normal.

Meantime, the long awaited program of social reform had only begun in true earnest. The political Left and organized labour were bitter over the delaying governmental tactics. They

also feared that the unpurged Vichy bureaucracy together with the new De Gaulle bureaucrats would combine to thwart the practical execution of any reform program. On Dec. 2, 1945, the assembly voted the nationalization of the Bank of France and four large private banks and placed all commercial credit institutions under sharp governmental supervision. According to the plan, stockholders would receive compensation for their shares in the form of negotiable and interest-bearing bonds; the existing personnel was to be retained; and the new governing boards would be composed of representatives designated by the government, capital and labour without having members of the assembly or the civil service serving on the boards. In addition to this long step toward nationalizing private credit, which had so frequently in the past dominated governmental policy, the assembly began a preliminary investigation looking toward nationalizing electricity.

France was also slowly restoring its prewar commercial relations with other European states as well as with the United States. By Dec. 1945, it had made commercial and financial agreements with Great Britain, Belgium, the Netherlands and Czechoslovakia. In the last week of the year the assembly passed a series of important measures which were expected to be of profound significance for future economic developments. It ratified the Bretton Woods agreement, endorsed the credit agreement with the Export-Import bank, whereby an additional credit of \$500,000,000 was made available for French purchases over and above the unexpired credits under lend-lease, and finally voted to devalue the franc and establish a new rate of exchange of 119.107 francs to the U.S. dollar. Manifestly, the desire behind these measures was to speed up the plan of foreign help, especially from the United States, without which French economy and reconstruction could not be revitalized.

PIERRE LAVAL testifying in defense of Henri Petain (seated right). Convicted of intelligence with the enemy on Aug. 15, 1945, Petain was given the death sentence, later commuted to life imprisonment. Laval was subsequently tried on similar charges and executed on Oct. 15

Whether devaluation would help was, however, an open question.

*International.*—The key to French foreign policy in 1945 was the steadfast determination of Bidault, and De Gaulle behind him, to have France serve as the point of equilibrium between the two great world forces—the United States in the west and the soviet union to the east. Concretely, the French problem had resolved itself into reaching agreement with Great Britain and the United States on the one hand and the soviet union on the other over Germany, the Mediterranean and the middle east. The French very realistically took the stand that without agreement on Germany there could be no real stability for Europe and the world, since unless and until France balanced the interests of the United States and Great Britain with those of the soviet union over the German settlement, the western and the eastern powers would remain alarmingly at odds everywhere else where they had overlapping interests. Hence a pact with Great Britain, serving as the nuclear centre of a wider and future “western bloc” to include all the countries west of the Rhine, remained a pivot of French policy. While France and Great Britain had composed their long rivalry and differences in Syria and Lebanon by their pact of early Dec. 1945, they had yet to reconcile their divergent views over the German question.

The French position on Germany was clear. Before any discussion of program for central administration in Germany or German economic rehabilitation, the Allies had to agree to destroy the German industrial potential by permanently removing the Saar, the Rhineland and the Ruhr from German military and political control. Simultaneously, provisions had to be worked out to ensure international economic utilization of the resources of these vitally important industrial areas. Without these measures, France would have no security, and the world no peace. Russia had already gained security on its frontier against Germany—why not France—was the argument. And to a state which had undergone the French experience of three invasions from 1870 and had lived under the fear that the United States forces might soon withdraw from their zone of occupation, such an argument was indeed real. Consequently, the French viewed with great anxiety the real or fancied intention of the United States to centralize the German administration and return it to the Germans in advance of the settlement of the Rhineland and the Ruhr, as well as the British intention of keeping the Ruhr politically within a future German state while temporarily assuming control over its industrial resources.

This anxious concern over Germany also helped explain the truculent efforts of France to prevent the “Big Three” from assuming sole responsibility for the shaping of the world to be. On the whole, although the French methods caused irritation, they brought De Gaulle’s government results. France became a permanent member of the Security council of the United Nations organization. It won a separate zone of occupation in southwestern Germany, and its representative sat on the Allied Control council in Berlin. At the Berlin conference France was invited to send its representative to the Council of Foreign Ministers of the “Big Five” (U.S., Great Britain, Russia, France and China) who were to conduct preliminary negotiations leading to the final peace settlement. And at the Moscow meeting in Dec. 1945, France was invited to sit with the representatives of the three great powers in drafting peace terms for Italy (though not for the Balkan enemies). Toward its former enemy, Italy, France followed a friendly policy, welcoming such democratic tendencies as Italy was permitted to make manifest; and toward the Spain of General Francisco Franco, France was cautiously exploratory, waiting for the United States and Great Britain to accept its proposal of joint talks on future relations with anti-Franco Spanish republicans in exile.

FRENCH WOMEN, voting for the first time, outnumbered men at the polls during the municipal election of April 29, 1945, which was also the first French election held after 1940

Outside of Europe a storm was brewing in the southeast Pacific where France was wooing the nationalists of Indo-China with a reform project promising large autonomy within a new colonial federation while at the same time combating the forces of the nationalists (the Viet Nam) with tanks and planes. (See also ANTI-SEMITISM; FRENCH COLONIAL EMPIRE; INTERNATIONAL LAW; WORLD WAR II.)

BIBLIOGRAPHY.—Kenneth Pendar, *Adventure in Diplomacy. Our French Dilemma* (1945). (L. Gy.)

**Franco, Francisco** (1892– ), Spanish soldier and statesman, was born Dec. 4, at El Ferrol, Galicia, and was graduated from the military academy of Toledo in 1910. After a varied military career, in which he saw service in Morocco, he became army chief of staff in 1935. Franco played a prominent role in the early days of the Spanish civil war (1936–39) and following the death of Gen. José Sanjurjo, he became the military leader of the rebels. After a bitter three-year struggle, in which he had received considerable aid in the form of men and matériel from Hitler and Mussolini, Franco defeated the loyalists in 1939 and emerged as the “caudillo” (leader) and prime minister of Spain. In the early days of axis victories in World War II, Franco affirmed Spain’s solidarity with Germany and Italy in the struggle against “bolshhevism.” When Allied arms began to triumph, he hastened to profess his neutrality and he denied that Spain had even been fascist or secretly allied with the axis powers. In 1945, following the collapse of Germany, he declared (May 20) that Spain was not a “dictatorship.” He followed this with an intimation (July 17) that a plan had been worked out under which the traditional monarchy would replace his regime. Then on Oct. 22, he issued a “bill of rights” which included freedom of worship and expression and the right to petition, provided these liberties did not run counter to the “fundamentals of the state.” (See also SPAIN.)

**Fraser, Sir Bruce Austin** (1888– ), British naval officer, was the son of an army general. Educated at Bradfield, he later joined the royal navy and was a gunnery officer in World War I. In 1926, he constructed an improved fire-control table which provided for greater accuracy in long-range firing. He was a flag captain in the East Indies and then was assigned to the battleship “Warspite” as chief of staff of the Mediterranean fleet. From the “Warspite,” Fraser went to the admiralty as Third Sea Lord

and Controller (1939-42), and in May 1940 he was promoted to vice-admiral. Adm. Fraser was second in command of the British Home fleet (1942) and commander in chief of the Home fleet (1943-44). In 1944, he was promoted to the rank of full admiral and given command of the British Eastern fleet which was based at Ceylon. This force assisted the land operations of Lord Louis Mountbatten's troops in the Burma-India theatre. On Dec. 10, the British admiralty announced formation of a new British Pacific fleet—one of the largest ever mustered by the royal navy—with Sir Bruce as commander in chief. Units of this naval force joined the U.S. 5th fleet in attacks against the Ryukyu Islands and the Tokyo area in the spring and summer of 1945. At the surrender ceremonies aboard the U.S.S. "Missouri," Sir Bruce represented the United Kingdom and signed the Japanese surrender document Sept. 2, which formally ended World War II.

**Fraser, Leon** (1889-1945), U.S. banker, was born Nov. 27 in Boston, Mass. A graduate of Columbia university, New York city, in 1910, he received his Ph.D. degree in 1915. He was admitted to the New York bar in 1914, although he held no law degree, and became an instructor in public law at Columbia. At the start of World War I, Fraser, a pacifist, organized a group opposed to the Plattsburg training camps, and this imperilled his position on the Columbia staff, from which he was subsequently dropped. When the United States entered the war, he enlisted as a private and was sent overseas at his own request. By the end of the war, he was a major and judge advocate in the A.E.F., he had won the D.S.M. and he was decorated by the French, Belgian, Italian and Yugoslav governments. He later became associated with the bureau of war risk insurance and was executive officer and an acting director of the Veterans' bureau. After leaving government service in 1922, he went to Paris to practise international law. Fraser was appointed to the vice-presidency and directorship of the Bank for International Settlements at Basle, Switzerland, in 1930; he was president of that body and chairman of the board, 1933-35. He became vice-president of the First National Bank of New York in 1935 and president of that institution in 1937. Fraser was found dead, presumably a suicide, at his estate in North Granville, N.Y., April 8. Notes which he left told of a melancholia condition which was steadily becoming worse.

**French Colonial Empire.** 'Total area (excluding Syria and Lebanon) (approx.) 4,579,000 sq.mi.; total pop. (est. Dec. 1939) 67,591,000. Certain essential information on the French colonies, protectorates and mandates is given in the table on page 330.

**History.**—Political unrest in north Africa and Indo-China marked the year 1945. In north Africa the unrest was caused largely by scarcity of food. The committee for north African affairs met in February under the chairmanship of General Charles de Gaulle to discuss the position. Visits of investigation were made by ministers and by a delegation from the assembly, the question being debated in the assembly itself in July. In Indo-China, after a period when the Nationalists were in virtual control of the country, a measure of order was restored and French authority reinstated with the help of British forces, assisted by Japanese troops. In April a new department of the ministry for colonies was created, to plan economic and social development in the colonies. Measures such as the granting of limited self-government to Indo-China and the convening

of a largely elected assembly in Madagascar were accompanied by increasing emphasis on the close integration of France with its empire, while in official quarters the term "France overseas" was substituted for that of colonies. An ordinance of August entitled France's overseas possessions, with the exception of Indo-China and of the protectorates of Tunisia and Morocco, to send 33 representatives to the constituent assembly.

**Algeria.**—Disturbances which started early in May in Oran, Algiers, and Sétif, spreading to Canrobert, Bougie, Philippeville and Blida, continued sporadically throughout June. Conditions approaching famine existed in parts of the country, which proved the opportunity for leaders of an Arab nationalist movement called "Friends of the Manifesto" party. Estimates of casualties varied but they ran into four figures. More than 2,400 arrests were made including those of the leaders, Fehrat Abbas and Dr. Saadane. The Egyptian government sought to obtain a reprieve for those condemned to death. Meanwhile the French government sent cereals intended for France, in order to relieve the economic situation, and Adrien Tixier, the French minister for the interior, visited Algeria in June. The government decided to grant family allowances to Algerian workers. The harvest was again bad. The electoral campaign for the municipal elections opened in the middle of July. The elections resulted as follows: "France Combattante" (including communists, socialists and Resistance) 31; Moslems 15; Conservatives 5.

The port of Oran was formally returned to the French authorities by the Allies in February. Trade through normal commercial channels began in March.

**Tunisia.**—General Charles Mast, resident-general, visited Paris in April, and in July the bey, Sidi Mohammed Al Amin (Sidi Lamine Pasha), accompanied by his son, visited France and German battlefields, returning to Tunisia at the end of the month. The ports of Sfax and La Goulette were again in use by April. A drought in the spring was followed by a bad harvest, the bread ration in April being 250 grams a day. Disturbances resulted in the retention of a ban on meetings at Sfax and Gabès and an order in July that persons circulating rumours likely to cause disorder were to be tried by courts-martial. The bey, on his visit to France, pleaded for the lives of Tunisians condemned to death by French military tribunals. Further incidents occurred in September. In November it was announced that 1,200 Italian families who had been actively pro-fascist during the war would be expelled to Italy.

**Morocco.**—In March it was estimated that 2,000,000 people in Morocco were suffering from hunger. The same month the right to hold meetings was suspended. Drought resulted in a harvest one-quarter the normal size and the bread ration was 250 grams a day, while prices had increased 400-500% from 1939. The sultan, Sidi Mohammed ben Youssef, visited French and German battlefields in June, returning to Morocco at the beginning of July. A visit by a consultative assembly delegation resulted in a debate in the assembly at the beginning of August in the course of which Georges Bidault, French foreign minister, outlined plans for reforms in Morocco, including a penal code, the reform of justice, no discrimination between French and Moroccans and the improvement of education. A dam in course of construction at Bin Al Ouidan was expected to produce 300,000,000 kw.hr. per annum.

**French West Africa.**—It was decided to build a French air and naval base at Dakar. A postal service functioning every second day between the United States and Dakar was established in February. A dam was planned at Richard-Tollin, in Senegal, and a sawmill in the Ivory Coast to enable lumber to be exported to the U.S. Wages increased and trade largely returned to private channels during the year. The harvest was good. Pierre Louis Maestracci was appointed governor of Senegal in succession to M. Dagain.

**French Equatorial Africa.**—The weekly production of meat in the Chad was estimated at between 4 and 5 tons and the production of cotton for 1945 at 45,000 tons, which was double that for 1939.

**Madagascar.**—In accordance with the agreement signed on Dec. 25, 1944, the naval base of Diego Suarez was handed back to France by the

ANNAMITE NATIONALISTS, captured during the Indo-Chinese insurrection which began in Sept. 1945. Rebels fought the return of French colonial rule and were opposed by British and French troops in Saigon

British in January. A decree of Feb. 14 established a government of southern Madagascar, comprising Fianarantsoa, Fort-Dauphin, Tuléar and Morondava with a governor appointed by the minister for the colonies but under the authority of the governor-general of Madagascar, Pierre de Saint-Mart. A representative council set up in April was convened at Tananarive in September. The council consisted of 60 delegates, 30 of whom were elected on a wide franchise and 30 appointed.

**Réunion.**—Damage caused by a cyclone in January was estimated at 60,000,000 francs (1 franc [Oct. 1945] 2.0189 cents U.S.). A cyclone in July caused much damage.

**French Somaliland.**—General Casseville replaced General George Lelong as general officer commanding East Africa.

**French India.**—Women were entitled to vote in the general elections held in October.

**New Caledonia.**—Local elections were held in June.

**Martinique.**—Georges Parisot, the new governor, arrived on Jan. 14. There was a strike of employees in the new sugar factory in June.

**Indo-China.**—An inter-ministerial committee to deal with the reconquest of Indo-China was formed in Paris in February, and De Gaulle made a statement the same month reaffirming France's sovereignty in the colony. The Japanese, by seizing control of the administration in March, disarming French troops and imposing martial law, forestalled effective French resistance which was in process of organization. Sporadic French resistance continued throughout April and May growing progressively weaker, largely owing to an insufficient supply of arms by air.

Declarations of independence in Annam, Cambodia and Luang Prabang followed the Japanese seizure of control, and Annam changed its name to Vietnam and proclaimed a new flag and national anthem. The emperor of Vietnam was Bao Dai and the prime minister Tran Trong Kim. Meanwhile the French government announced plans for limited self-government in Indo-China. A federation of Tongking, Annam, Laos, Cochinchina and Cambodia was to have a federal government, under a governor-general, composed of both Indonesians and French. The Japanese declared the full independence of Indo-China on Aug. 15, after an offer of surrender had been made, and proceeded to arm the Indonesians.

The sudden collapse of Japan found British and Chinese troops the only forces in a position to occupy the country, which they proceeded to do early in September. The Indonesians were in virtual control of the administration of the country and actively pursuing a policy of victimization of the French. Despite numerous incidents, the British were able to declare martial law on Sept. 20 and to make possible a successful French coup d'état in Saigon by which French authority was restored. The coup d'état was followed by fighting in which surrendered Japanese troops assisted the British and French while other Japanese helped to organize Annamite resistance. Meanwhile French reinforcements were rushed to the area with British help, General Jacques Leclerc arriving early in October and the new high commissioner, Admiral Thierry d'Argenlieu, proceeding later. An Anglo-French pact was signed in London in October by which Great Britain recognized France's rights in Indo-China. In November it was announced that Cambodia had been granted internal autonomy. Meanwhile in the north Chinese troops not only entered Tongking as had been agreed but also Laos, which provoked a French protest. A French general who had previously been refused permission by Chinese forces to enter Hanoi was enabled to do so only after strong representations had been made by the French to the Chinese government. An independent Viet-Minh administration was in control at Hanoi; while Chinese troops were in occupation of the area. (See also PACIFIC ISLANDS, FRENCH; SYRIA AND LEBANON.) (D. K. M. K.)

**French Possessions in America.**—The colonies of France in America fall into three regional groupings: the small islands of St. Pierre and Miquelon (area, 93 sq.mi.; pop. about 4,000) at the mouth of the Gulf of St. Lawrence; French Guiana and Inini (area, c. 34,740 sq.mi.; pop. c. 37,000) on the east coast of South America north of the Amazon river; about 6 islands in the Lesser Antilles, the most important of which are Martinique (area, 386 sq.mi.; pop. 260,000) and Guadeloupe (area, 690 sq.mi.; pop. 310,000). Population of the other small Antillean islands was estimated at about 23,000 in 1942.

Gov. Georges Parisot took over his post as governor of Martinique in Jan., 1945; his appointment had been made by Gen. Charles de Gaulle the previous year. Elections held in Martinique in August resulted in a definite leftist trend as in France. In Fort-de-France, the capital, 29 communists were reported elected to the 32-member city council, and throughout the island the Socialist party carried 11 communes, the Radical socialists 7, and the communists 3.

The economic situation in the Caribbean colony improved slightly in the first half of 1945, but continued to be affected by a greatly reduced production of the major crop, sugar cane, due to shortages of equipment and fertilizer. Guadeloupe, able to raise more foodstuffs and cattle than Martinique, was better off. There was considerable labour unrest, and the sugar cane grinding season in Martinique was delayed by wage controversies until the governor in March decreed a 25% wage increase. Two other measures tended to reduce import prices: one decree cut profit margins for merchants, the other temporarily suspended tariff duties on certain basic food items.

A new loan of 200,000,000 francs (1 franc [Oct. 1945] 2.0189 cents U.S.) was reported as proposed for a public works program in Martinique covering improvement of port and harbour facilities and the construction of airports. For a similar program in Guadeloupe 10,000,000 francs had been included in plans for construction, and French Guiana had been authorized in 1944 to borrow 1,200,000 francs for improvement of port and transportation facilities.

French possessions outside of the Caribbean received little mention in 1945; St. Pierre and Miquelon were noted as having operated under republican laws, with regulations of the Vichy government voided in the latter part of 1944.

**Finance.**—The Martinique budget for 1945 estimated receipts at 250,319,000 francs (1944: 243,806,000 francs), expenditures at 250,319,000 francs (1944: 243,806,000 francs). The budget for Guadeloupe for 1945 totalled 199,377,000 francs, not including a public works budget of 10,000,000 francs.

**Trade.**—Sugar production in Martinique reached a new low of 2,990 metric tons in 1944, with estimates for the 1945 crop placed at 9,182 metric tons. Rum production in 1945 was estimated at about 22,000,000 litres (1944: approx. 18,000,000 litres). Guadeloupe exported about 47,000 metric tons of raw sugar in 1944; 572,289 proof gals. of rum were also exported to the U.S. during the year.

**Resources.**—Main French Guiana products were: gold, cabinet woods, cacao, fish glue, rum. St. Pierre and Miquelon were dependent on fishing. The French West Indies produce sugar and rum, vanilla, coffee, bananas and cacao. (D. Rb.)

**French Literature.** Alterations in the French literary scene which were discernible in outline immediately after the liberation of Paris, deepened as World War II came to a close, and by midsummer, 1945, it had changed so radically that little remained of the essential features of "pure poetry" and "pure intellectualism" that characterized so much French writing between the two wars. For not only were the ranks greatly thinned by the four-year toll of death, collaboration and exile, but also, the gruelling experience of the occupation years, during which only the most fragmentary (usually clandestine) literary production was possible for the noncollaborator, was accompanied by deep probings of the literary conscience, the fruit of which proved to be a sterner concept of the writer's relation to society than was witnessed in France from the time of Émile Zola, or Victor Hugo. A *littérature engagée* (a responsible literature) was demanded by Jean Paul Sartre, one of the dominating figures of Resistance and postwar French letters, who, introducing his new review *Temps Modernes* (Oct. 1945) wrote:

"Were we dumb and immobile as stones, our very passivity would constitute an action. The abstention of one who devotes his life to writing novels about the Hittites entails taking up some kind of attitude. The writer is situated in his time; each word has its reverberations, each silence, too. I hold Flaubert and Goncourt responsible for the repressions which followed the Commune, because they wrote not a single line to prevent them. It might be said that it was none of their business. But was the case of Calas the business of Voltaire? the sentencing of Dreyfus the business of Zola? the administration of the Congo the business of Gide? Each one of these writers in some particular circumstance of his life, weighed his responsibility as a writer. The occupation has taught us ours. Since, by our very existence, we influence our time, we must decide that this influence shall be deliberate. . . . It is not by chasing after immortality that we shall make ourselves eternal. We shall not make ourselves absolute by reflecting in our works the desiccated principles which are sufficiently empty and negative to pass from one century to another, but by fighting passionately in our time, by loving it passionately, and by consenting to perish entirely with it."

This viewpoint, although only formulated publicly by Sartre in 1945, was the same that animated all the Resistance writers during the occupation. Its statement, therefore, constituted both a reaffirmation of intention and a new appeal to the literary conscience. It is significant that not only Sartre himself, whose preoccupations along these lines were further manifest in his *L'Age de Raison* and *Les Sursis*, constituting the first two volumes of a trilogy entitled *Les Chemins de la Liberté*, but also such writers as Simone de Beauvoir, author of *Le Sang des Autres* and a philosophical treatise entitled *Pyrrhus et Cinéas*; as Albert Camus, for many months leading editorialist of the newspaper *Combat*, whose much discussed plays *Caligula* and *Le Malentendu* were produced during 1945, and whose new work *La Peste* was ready for publication; as Romain Gary, whose remarkable and widely praised *Education Européenne* was awarded the *Prix des Critiques*; as Roger Vailland, author of *Drôle de Jeu*, generally considered to be the most profound work yet to have appeared on the subject of the Resistance; in other words, that most of the more gifted, younger writers had already consciously or unconsciously, espoused the cause of *la littérature engagée*.

In addition to the impetus resulting from this determination, already evidenced in the works of André Malraux, to restore to literature its status of social function, particularly with regard to intention, literary activity was further accelerated by the creation in Paris of what promised to become the first authentic literary-philosophical "school" after the early 1920s, when surrealism first made its appearance. Again under the leadership of Sartre (see his *L'Être et le Néant*) the movement known as "Existentialism," many of whose tenets stem from Martin Heidegger and Søren Kierkegaard, although accused by some of advocating the "negation of all creation and hence of all morality," and attacked by others with the sharp barbs of ridicule, nevertheless continued to constitute a decided pole of attraction for most of the more alive and original elements in current French literature. Even so aggressive an attack as Julien Benda's *La France Byzantine*, which, although directed chiefly at what he termed the "anti-intellectual" attitude of such writers of the older generation as Paul Valéry (who died July 21, 1945, at the age of 73), André Gide, Marcel Proust, Jean Giraudoux, Alain (Emil Chartier), et al., but which referred in passing to the Teutonic origin of the masters "of one of our most fashionable philosophies" as "an immense victory for Germany," left "Existentialism" well supported by most of the literary *avant-garde*. It should be noted here, however, that Camus, whose *Le*

*Mythe de Sisyphe* (1944) opposed the "existentialist" philosophers, declared in an interview, *Les Nouvelles Littéraires* (Nov. 15, 1945), that although he and Sartre had much in common he did not consider himself an "existentialist."

One of the most impressive features of French letters in 1945 was that of luxuriant abundance, and this despite almost insurmountable material difficulties. In Paris alone more than a dozen weekly newspapers published original and critical literary material of excellent quality and two of these, *Les Lettres Françaises* and *Les Nouvelles Littéraires*, devoted practically their entire space to literary matters. In addition to these, some 25 literary and artistic reviews, appearing monthly or quarterly, eight of which were new, furnished ample opportunity of expression to all schools and shades of thought. Among these, mention should be made of such prewar periodicals as *La Revue de Paris*, *Cahiers du Sud*, *L'Amour de l'Art*, *Esprit*, all of which maintained a high literary standard; as also a number of more recent reviews such as *Les Temps Modernes*, *L'Eternelle Revue*, *Poésie '45*, *Confluences*, *Fontaine*, *L'Arche*, *La Nef*, certain of which originated in other cities and only went to Paris after the liberation.

A number of new names, too, were added to the list of already established publishing houses, which fact, according to many indications, would seem to have created a more favourable "climate" for the younger newcomers than had existed for many years. Both newcomers and established writers, however, fared well, and there was hardly a writer of repute who was not represented in the year's output, either by a reprint, or by a new work. To mention only a few titles: *La Marche à l'Etoile*, a long short story, by "Vercors" (published in a new edition of the 24 vols. constituting the entire clandestine *Editions de Minuit*); *Les Mandrins*, novel, by Joseph Kessel; *L'Etoile et la Clef*, novel, by Loys Masson; *Mon Village à l'Heure Allemande*, novel, by Jean Louis Bory (Prix Goncourt 1945); *Le Premier Accroc Coute Deux Cents Francs*, novel, by Elsa Triollet (Prix Goncourt, 1944, distributed early in 1945); *Plusieurs Femmes*, by G. du Genet; *Noces*, by Camus; *Inventaire de l'Abîme*, essays, by Georges Duhamel; *Nous Autres Français*, essay, by Georges Bernanos; *A l'Echelle Humaine*, essays, by Léon Blum; *Sainte Marguerite de Cortone et Le Baïllon Dénoué*, by François Mauriac; *Servitude et Grandeur des Français*, by Louis Aragon; *Anthologie de l'Humour Noir* (re-edition) by André Breton; *Voltaire*, by Valéry; *Sur Nietzsche et Volonté de Chance*, by Georges Bataille; *Gigi*, by Colette; *Péguy*, by Romain Rolland (in 2 vols. of 300 pages each); *La Poésie Moderne et le Sacre*, by Jules Monnerot; *Seuls Demeurent*, poems by René Char; *Poèmes et Paroles pendant la Guerre de Trente Ans*, poems, by Paul Claudel; *Dignes de Vivre*, poems, by Paul Eluard; *Univers de la Parole*, essays on poetry, by Roland de Renéville, etc.

Many beautifully presented deluxe editions were also published, among which may be mentioned: *Le Bain avec Andromède*, by Robert Desnos (who died in Germany, after liberation from a concentration camp); *En Avril 1944: Paris Respirait Encore*, by Eluard, with illustrations by Jean Hugo; as well as works by Claudel, Aragon, Léon-Paul Fargue, Gérard de Nerval, Giraudoux and others.

Two books by Breton: *Arcane 17*, illustrated by Echaurren Matta, and *Le Surréalisme et la Peinture*, appeared in New York, as did a popular edition of *Anabase*, by St. Jean Perse. *Le Serpent dans la Galère*, a long poem inspired by Paris under the occupation, by Georges Duthuit, with numerous illustrations by André Masson, also appeared in New York, in a limited deluxe edition. Gide's translation of *Hamlet*, begun some 20 years before and completed in Tunisia during World War II, was published in New York.

*Les Lettres Françaises*, the excellent wartime literary review which appeared in Buenos Aires from 1941, ceased publication in the spring, because of the return to France of its director, Roger Caillols.

No account of the year's literary activity would be complete that did not mention the brilliant revival of the theatre as an important literary form. Such plays as Camus' *Caligula* and *Le Malentendu*; as Sartre's *Les Mouches* and *Huis-Clos*; as de Beauvoir's *Le Sang des Autres* (adapted from her novel); as Giraudoux's posthumous *La Folle de Chaillot*; served to stimulate public interest in the theatre to the point of making it necessary to seek new locations to house the numerous plays ready to be staged.

Despite its interest in native production, the French public also showed great curiosity concerning the literature of other countries (of which they were so long deprived), and many translations from a variety of foreign literatures were published. Notable among those from the English language were works by Aldous Huxley, Evelyn Waugh, Katherine Mansfield, Elizabeth Barrett Browning, Erskine Caldwell, Eugene O'Neill, John Steinbeck, etc.

In the United States, the Philosophical library published *The Creative Mind*, by Henri Bergson; an important anthology of Aragon's prose and poetry was published in translation, as well as a new "bedside" edition of translated French short stories, brought up to date to include such writers as Malraux, Kessel, Sartre and Antoine de St. Exupéry. A number of articles and short anthologies dealing with current French literature, appeared in the *Sewanee*, *Yale*, *Partisan* and *Kenyon* reviews. In London, the review *Horizon* devoted several numbers to the presentation of the Paris literary scene to English readers. (E. Js.)

**Friedeburg, Hans Georg von** (1895-1945), German naval officer, was born

July 15 at Strasbourg. After Grand Admiral Karl Doenitz became the reich fuehrer in the final days before Germany's surrender in 1945, Adm. Friedeburg was appointed commander-in-chief of the German navy, Doenitz's old post. Friedeburg was assigned the task of negotiating the surrender, announced by the Allies on May 4, of all German forces in Holland, northwest Germany and Denmark, including Helgoland and the Frisian Islands, to Marshal Montgomery's 21st Allied army group. The following day (May 5), he said that the German navy must meet "with armed resistance every attempt at disarmament." This was an empty statement, however, as negotiations for the final surrender of the reich already had begun and Friedeburg himself was one of the German signatories to the unconditional surrender document signed at Reims, France, May 7, 1945, that closed the European phase of World War II. Friedeburg also signed the Berlin document formally ratifying the surrender, May 8. On May 23, he and other members of the Doenitz government and the German high command and general staff were taken into custody by Allied officers and interned, temporarily, aboard the German liner "Patria" in Flensburg harbour. Although precautions had been taken by the Allied officers to prevent the Germans from committing suicide, Friedeburg succeeded in evading the Allied escort officers and swallowed poison. His death was reported May 23.

**Friends, Religious Society of.** The Religious Society of Friends represents a spiritual movement which had its origin in England more than 250 years ago under the leadership of George Fox. Its central doctrine proclaims that a divine light dwells in each individual, revealing that which is evil and raising up that which is good.

In organization the Religious Society of Friends is composed of 53 yearly meetings and annual conference groups with an approximate membership of 164,000, representing 30 countries. In the United States in 1945 there were 27 yearly meetings with a membership of approximately 113,000. In Great Britain there is one yearly meeting with a membership of approximately 19,694.

The Five Years meeting with headquarters at 101 S. Eighth St., Richmond, Ind., held its quinquennial session in Oct. 1945. Eleven yearly meetings are affiliated with this body, which carries on its work through boards on peace, missions, Christian education, public morals, evangelism and social order. Its board of missions conducts mission work in East Africa, Cuba, Jamaica, Mexico and Palestine. The mission board celebrated its 50th anniversary in Aug. 1944. The official publication of the Five Years meeting is the *American Friend*. The Friends general conference with headquarters at 1515 Cherry St., Philadelphia, Pa., was to hold its next conference in 1946. Six yearly meetings belong to this conference group and are drawn together by their common interest in religious and secular education, social service and the advancement of Friends' principles. The *Friends Intelligencer* is the weekly religious journal representing this group of Friends.

The Conservative group of Friends have no central organization, but the six yearly meetings keep in close correspondence with one another. Philadelphia yearly meeting with headquarters at 304 Arch St. might naturally be included in this group, but it also has closer association both with the Friends general conference and the Five Years meeting.

The four remaining yearly meetings are more evangelistic and fundamentalist in nature and outlook. They conduct mission work in Africa, China, India and in Bolivia, South America.

The American Friends fellowship council with headquarters at 20 S. Twelfth St., Philadelphia, Pa., was established in 1936 to help promote the spirit of unity and understanding throughout

the Society of Friends in America. Among its activities is the Wider Quaker fellowship which is composed of persons who belong to other religious groups but who also desire fellowship with Friends. The three yearly meetings in Canada hold joint sessions. The two yearly meetings in New England had after June 1945 a united yearly meeting. Both orthodox and general conference yearly meeting groups in New York city, Baltimore, Md., and Philadelphia hold some joint sessions. This tendency toward unity and co-operation between the various groups was a marked trend after 1939.

The Friends world committee for consultation was organized at the Friends world conference held at Swarthmore, Pa., in 1937. There are three main sections of the committee as follows:—The European section including Denmark, Ireland, France, Germany, Great Britain, Holland, Prague group, Norway, Sweden and Switzerland. The American section includes the yearly meetings in the U.S., Canada, Mexico, Cuba and Jamaica. Also in this section should be the work the California yearly meeting does in Alaska, Guatemala and Honduras. The far eastern and African section includes East and South Africa, Hawaii, Madagascar, Pemba, China, Japan, India, Syria and Palestine, Australia and New Zealand. The work of the committee is promoted through intervisitation, national and regional conferences and publications.

The Friends committee on national legislation with headquarters in Washington, D.C., keeps in close touch with national legislation of interest to religious groups. Through its monthly newsletter, American Friends are kept informed on important legislative issues.

The American Friends service committee, 20 S. Twelfth St., Philadelphia, Pa., with branch offices in Los Angeles, Calif., Seattle, Wash., Chicago, Ill., and Boston, Mass., is the organization in the Society of Friends in America, which unites with the Friends service council in England in work of relief and social welfare throughout the world. The service committee carries on its work through its sections on foreign service, social-industrial, peace, clothing and civilian public service.

Through its foreign service section relief work was undertaken in the occupied countries soon after the cessation of hostilities in Europe. In 1945, relief work was carried on in Finland, France, Spain, Italy, North Africa, India and China. In the U.S. the social-industrial section carried on a program of rehabilitation projects in underprivileged areas and race relations education in localities where race tension was high. Thirteen annual institutes on international relations were held throughout the various sections of the U.S. as a part of the education program of the peace section.

Civilian public service was a program in which approximately 7,000 conscientious objectors were permitted by selective service to do work of national importance under civilian direction. Together with the Brethren and Mennonite service committees, the Friends directed this program from its beginning in 1940. The projects included soil conservation, farm service, fighting forest fires, acting as guinea pigs for medical research and serving as attendants in mental hospitals and training schools for mentally deficient children. Because of the end of World War II this program was to terminate early in 1946. (See also CHURCH MEMBERSHIP.) (HA. H.)

**Frings, Joseph** (1887— ), cardinal archbishop of Cologne, was born at Neuss, Germany, on Feb. 6. He was ordained in 1910, and served as rector of the Major seminary at Bensburg for many years.

He was named archbishop of Cologne in 1942 to succeed Joseph Cardinal Schulte. During World War II he fearlessly condemned nazi bombings and atrocities; defiantly censured

"evils perpetrated by the nazis" in numerous pastoral letters; remained with his flock throughout terrible bombings of Cologne, sharing their sufferings and privations, and even during bombardments never abandoned his episcopal residence, which was located in the heart of the city. He presided at the Fulda conference of the German hierarchy.

In 1945 he had laid plans to restore the famous Cologne cathedral to its former splendour by 1948, the year of the 700th anniversary of its foundation.

On Dec. 23, 1945, it was learned that he was among the 32 new cardinals appointed by Pius XII. He was created and proclaimed a cardinal on Feb. 18, 1946.

**Fruit.** The 1945 season in the United States, was one of varied returns of fruits ranging from several high record crops to some near-failures. The estimated combined total of 13 fruit crops was down 5% from 1944 but higher than any other year and 35% above the 1923-32 average. The greatest loss was that of apples which was only about a half crop. At the same time peaches made a new record production. Citrus fruits were abundant, grapefruit making a high record and oranges yielding only 2% less than 1944. Prices held firm through the year, consumers continuing the high rate of fruit consumption which had been growing during World War II. The decrease of military needs did not come into effect to any appreciable extent in the 1945 season.

Table I.—U.S. Apple Production in Leading States, 1945 and 1944

State	1945 bu.	1944 bu.	State	1945 bu.	1944 bu.
Washington . . .	25,840,000	31,100,000	Ohio . . . . .	984,000	395,000
California . . .	9,240,000	6,144,000	Indiana . . . .	828,000	1,363,000
Virginia . . . .	3,145,000	14,580,000	Missouri . . . .	817,000	660,000
Oregon . . . . .	2,774,000	3,432,000	Maryland . . . .	689,000	1,863,000
Illinois . . . . .	2,684,000	2,418,000	Connecticut . . .	511,000	1,523,000
Pennsylvania . .	2,470,000	9,100,000	New Mexico . . .	472,000	760,000
Idaho . . . . .	2,465,000	1,900,000	Utah . . . . .	420,000	629,000
New York . . . .	2,160,000	17,010,000	Massachusetts . .	410,000	2,747,000
West Virginia . .	1,625,000	4,356,000	Tennessee . . . .	405,000	351,000
New Jersey . . .	1,295,000	2,090,000	Wisconsin . . . .	316,000	805,000
Colorado . . . .	1,275,000	2,002,000	Arkansas . . . . .	312,000	568,000
Michigan . . . .	1,250,000	7,625,000	Montana . . . . .	290,000	400,000

**Apples.**—The commercial apple crop was a near-failure in 1945 being the smallest of late years. The United States department of agriculture estimated the total at only 64,400,000 bu. compared with 124,754,000 bu. in 1944 and a ten-year average of 119,046,000 bu. 1934-43. The crop was shortest in the eastern and central states which together had only one-third of the United States crop compared with two-thirds in 1944. The very early warm weather, followed by spring freezes and bad weather for pollination were the causes of the failure. Insect damage was also severe and accounted for the low quality of the fruit harvested. Commercial production in the western states was 8% below 1944, only California having a crop larger than in 1944. Summer and fall varieties were better crops than the winter sorts. The summer varieties were 21% short of 1944, fall varieties 41% and winter varieties 47% less. Winter apples usually amount to four-fifths of total commercial production.

Prices of apples were at ceilings, because of the short crop, most of the year. Prices to producers for apples averaged \$2.84 per bu. in October compared with \$2.05 a year earlier. Consumers paid high prices for the choice western varieties which brought from \$3.50 to \$4 per bu. Ceiling prices were advanced 4 cents per bu. on western apples and 7 cents on others, beginning Oct. 1, 1945. A larger proportion of the western crop came to eastern markets. Dryers reduced their purchases because of the high prices. The government issued a set-aside order in October requiring about 25% of all the northwest crop be subject to its purchase.

**Avocados.**—The 1945-46 avocado crop was estimated at 21,800 tons, a gain of 42% over the 15,300 crop of 1944 but below the record of 25,900 in 1943. California production was responsible for the gain, being 18,600 tons in 1945 compared with 9,500 tons in 1944 while the Florida crop was only 3,200 tons compared with 5,800 tons a year earlier.

**Bananas.**—The supply of bananas increased slowly through 1945 but was far short of supplying the demand. The shortage of properly equipped ships and the labour problems of producers were the principal handicaps. The Mexican crop was about the same in 1945 as a year earlier or nearly 20,000,000 bunches of 50 lb. each. Hurricanes destroyed a large area in Chiapas. During the first eight months of the year the United States imported more than 3,800,000 bunches from Mexico. Larger quantities were brought in from Nicaragua, Haiti, Cuba and Puerto Rico. The total supply was expected to exceed that of 1944 when 31,600,000 bunches were imported compared with a prewar normal of about 56,000,000 bunches. Growers' troubles in Central America were the principal handicap on production. High prices in the United States and Canada were an incentive to the prompt revival of the trade.

**Cherries.**—Total production in the 12 cherry states was estimated at 140,660 tons in 1945, 30% less than the 1944 crop and 8% below the

average. Sweet cherry production was the highest on record after 1938 at 95,870 tons but sour cherries amounted to only 44,790 tons, the lowest after 1938 except for 1943. Washington had a record crop of sweet cherries and Oregon and California near records.

**Cranberries.**—The 1945 cranberry crop in the United States was estimated by the U.S. department of agriculture at 649,000 bbl., 76% larger than the very light crop harvested in 1944 and 3% above the ten-year average of 631,660 bbl. 1934-43. The Massachusetts crop which was a near-failure in 1944 was 11% above the average in 1945. Harvest was late but the crop was of good quality. Labour shortage delayed harvest into November in Massachusetts and New Jersey, but was completed early in Wisconsin, Washington and Oregon. The production by states was as follows: Massachusetts 470,000 bbl., Wisconsin 81,000 bbl., New Jersey 49,000 bbl., Washington 36,400 bbl. and Oregon 12,600 bbl.

**Dates.**—A crop of 4,520 tons of dates was harvested in California in 1945 compared with 13,140 tons in 1944 and 5,064 tons average, 1934-43. Early rains damaged the crop and reduced the early prospects.

**Figs.**—California harvested a smaller crop of figs in 1945. Dried figs totalled 30,800 tons or 12% less than the 35,200 tons crop of 1944. The crop for sale fresh and for canning was 14,000 tons in 1945 compared with 19,000 tons in 1944. The Texas fig crop was 1,100 tons for canning, compared with 750 tons in 1944 and an average of 1,180 tons 1934-43.

Table II.—U.S. Production of Grapefruit by States, 1945† and 1944

State	1945 boxes*	1944 boxes*	State	1945 boxes*	1944 boxes*
Florida			California		
Seedless . . .	13,000,000	8,400,000	Desert Valley . .	1,330,000	1,530,000
Other . . . .	19,000,000	13,900,000	Other . . . . .	2,200,000	2,250,000
Texas . . . . .	23,000,000	22,300,000	Arizona . . . . .	4,500,000	3,750,000

\*Net contents of boxes of grapefruit are 60 lb. in California; in Florida and other states, 80 lb. †Estimates for 1945-46 production are preliminary.

**Grapefruit.**—The total grapefruit crop of 1945 was of all-time record size 21% above 1944 and 70% above the ten-year average reflecting the rapid growth in the production of this fruit. The crop was estimated at a total of 63,030,000 boxes compared with 52,130,000 boxes in 1944 and 37,000,000 boxes 1934-43. Florida came back after great loss from the hurricane in 1944. Of the Florida grapefruit used before Dec. 1, 1,900,000 boxes were processed and 2,700,000 boxes sold fresh. In 1944 2,900,000 boxes were canned and 2,400,000 sold fresh. Texas grapefruit production was also expanding steadily. Prices were well sustained through the year. World production of grapefruit was doubled in ten years and new plantings were expected to give an increasing output for several years ahead.

**Grapes.**—The 1945 crop of grapes was the second largest on record, 2,804,500 tons, 2% above 1944 and 13% above the ten-year average, 2,474,000 tons 1934-43. The severe frost damage in the eastern states held the crop to less than half the average. California which usually produces about 92% of the nation's total in 1945 produced 95% or an increase of 6% over 1944 but 4% less than the record production of 1943. All of the increase was in raisin varieties but a smaller percentage of the raisins were dried and raisin output fell off. California's crop of table grapes was 23% above average while the wine varieties were near average. The crop in the Pacific northwest was very good.

**BANANA WAREHOUSE** in Chicago where produce was threatened by spoilage when the truck drivers' strike of May 1945 held up local deliveries

Table III.—U.S. Production of Grapes in Leading States, 1945 and 1944

State	1945 tons	1944 tons	State	1945 tons	1944 tons
California . . . . .	2,678,000	2,514,000	Tennessee . . . . .	1,900	2,300
New York . . . . .	30,000	59,300	Nebraska . . . . .	1,700	1,300
Washington . . . . .	18,000	17,300	Alabama . . . . .	1,500	1,200

Texas . . . . .	2,100	2,100	Virginia . . . . .	250	1,800

**Lemons and Limes.**—The California lemon crop was estimated at 13,900,000 boxes in 1944 and the ten-year average 11,339,000 boxes 1934-43. This compares with the record production of 17,236,000 boxes produced in 1940. Imports of lemons were practically stopped during the war and did not begin in 1945. Prices continued high through the year at around \$7 per box at auction in New York.

The 1945 crop of limes, all grown in Florida, was estimated at 200,000 boxes compared with 250,000 boxes raised in 1944 and 93,000 boxes the average 1934-43. The drought through the citrus belt was the principal cause of a smaller harvest than in 1944.

**Olives.**—The California olive crop did not do well because of unfavourable weather. The total 1945 crop was only 31,000 tons compared with 42,000 tons harvested in 1944 and an average of 41,100 tons 1934-43. The crop of 1943 was a record at 57,000 tons.

Table IV.—U.S. Production of Oranges by States, 1945 and 1944

State	1945 boxes*	1944 boxes*
California . . . . .	51,300,000	60,300,000
Valencias . . . . .	32,400,000	38,200,000
Navels and miscellaneous . . . . .	18,900,000	22,100,000
Florida . . . . .	50,000,000	42,800,000
Early and midseason . . . . .	26,000,000	21,700,000

Louisiana . . . . .	310,000	360,000

\*Net content per box of oranges in California and Arizona approximates an average of 77 lb.; in Florida, Texas and other states, 90 lb.

**Oranges.**—Total United States orange production in the 1945-46 season was put at 107,350,000 boxes which was 2% less than the preceding record crop but 46% larger than the ten-year average of 73,725,000 boxes. The crop of early and midseason oranges was 3% more than in 1944 while Valencias were 5% below the previous year. The Florida crop might have been larger had not the drought from February to June caused a light set of fruit. The total production of Florida approached that of California for the first time. With the decline of military needs prices of oranges began to decline in the fall months with the appearance of new fruit on the market. In spite of increasing production after 1938 prices advanced steadily until the middle of 1945.

**Tangerines.**—The 1945 Florida tangerine crop was estimated at 4,000,000 boxes, the same as in 1944 but 44% above the average. This fruit was enjoying a new popularity and prices were well sustained.

Table V.—U.S. Peach Production in Leading States, 1945 and 1944

State	1945 bu.	1944 bu.	State	1945 bu.	1944 bu.

Alabama . . . . .	2,440,000	1,380,000	Pennsylvania . . . . .	1,222,000	1,886,000

**Peaches.**—A record peach crop was harvested in 1945 of a total 81,578,000 bu. compared with 75,963,000 bu. in 1944 and 57,201,000 bu., the ten-year average. The previous record crop was 77,846,000 bu. harvested in 1931. All of the principal peach-growing areas had large crops except in a few localities where the early freeze killed some of the crop such as Virginia, West Virginia, Maryland and Delaware. The ten southern states had very favourable weather that resulted in a production 56% above 1944 and 71% above the average. In the far west the yields were high, California clingstones being 35% above average. The freestone crop was also large. Losses due to lack of labour at harvest and packing time amounted to about 5% of production compared with 10% loss in 1944. Prices held up close to ceilings despite heavy shipments through July but receded later in the season. The average for 1945 was about the same as the \$2.29 per bu. received for the 1944 crop.

**Pears.**—Production of pears made a new high record of 33,574,000 bu., 5% above 1944 and 17% above the prewar average. The crop in the west was a third above average but in the north Atlantic states the crop was only one-fourth of average due to the spring frosts. In the three Pacific states production of Bartlett's was 16% above the year earlier and 40% above average.

Prices of pears were close to the ceilings throughout the year. These ceilings which were first applied to pears in 1944 were \$3.60 per box for California pears at the beginning of the season, advancing with the season to \$4.60 per box beginning April 1, 1946, when the last of the

Table VI.—U.S. Pear Production in Leading States, 1945, 1944 and 10-Yr. Average

stored crop would be marketed. Kieffers sold at prices a little below the previous year but Seckels were higher.

**Plums and Prunes.**—The 1945 plum crop at 73,200 tons was 25% below the 1944 record crop of 98,200 tons. Both California and Michigan had smaller crops. California harvested 71,000 tons compared with 92,000 tons in 1944 and an average of 66,200 tons, 1934-43 while Michigan had only 2,200 tons compared with 6,200 tons in 1944 and 4,930 tons average.

Table VII.—U.S. Production of Prunes in Tons, by States, 1945 and 1944

Washington . . . . .	300	300
Frozen . . . . .	10,200	8,800
Farm household use . . . . .	6,800	6,900

Prune production for all purposes in Idaho, Washington and Oregon was estimated at 144,800 tons (fresh basis) compared with 110,300 tons in 1944 and an average of 142,930 tons, 1934-43. In California production was 212,000 tons (dry basis) in 1945 compared with 159,000 tons in 1944 and an average of 205,000 tons. In 1945, 1,000 tons were reported as unharvested in California and 12,400 tons of prunes in western Oregon.

**Pineapples.**—Florida produced 10,000 crates of pineapples in 1945 compared with 15,000 crates in 1944, 3,000 crates in 1943 and an average of 10,800 crates 1934-43. Imports of pineapple increased 881,000 crates arriving in 1944 compared with 602,000 crates in 1943. Large quantities of prepared and candied pineapple were also being imported. **FSA:** see FARM SECURITY ADMINISTRATION; FEDERAL SECURITY AGENCY.

**FSLIC:** see HOUSING.

**FTC:** see FEDERAL TRADE COMMISSION.

**Fuel Briquettes.** The production of fuel briquettes in the United States expanded rapidly during the years of World War II, since it provided a satisfactory fuel from otherwise low-grade material. Output increased by 14% in 1944 and value by 22%, from 2,163,998 short tons in 1943 to 2,464,961 tons in 1944. In 1944 there were 30 plants operating in 15 states, with 7 more under construction. Wisconsin had 10 plants and about half the output, using bituminous coal slack that accumulated at the Great Lakes shipping ports.

(G. A. Ro.)

**Fuel Oil:** see BUSINESS REVIEW; PETROLEUM.

**Fuller's Earth.** The production of fuller's earth in the United States increased from 247,258 short tons in 1943 to 294,737 tons in 1944, the highest figure after the record peak of 1930, and nearly double the output of

1940. The refining of mineral oils took 61% of the total, vegetable oils 8%, rotary drilling mud 10% and absorbent uses 19%.  
(G. A. Ro.)

**Furniture Industry.** At the close of 1945, 2,300 factories in the United States manufacturing wooden household furniture had increased by 5% their 1944 production, despite their heavy contribution to the war effort, producing a total output of \$640,000,000 (wholesale) as compared with \$610,000,000 in the previous year. This was the highest volume after 1941, during which year production consisted of household furniture only and reached \$660,000,000. During 1945 the industry also produced approximately \$200,000,000 worth of war supplies, for a total production of more than \$800,000,000, the greatest dollar volume in the industry's history.

While output gained in value, it dropped in units because of increased prices granted newcomers and a 5% increase granted all furniture manufacturers in 1944. As compared with 1941, however, volume showed a much greater loss because only medium- and high-priced furniture was produced in 1945 while low-priced furniture was popular in 1941.

Wage earnings in the wooden household furniture industry reached an all-time peak in 1945 while employment dropped to 117,000, the same as in 1934. Average hourly earnings in 1945 were 89 cents compared with 55.5 cents in 1941 and weekly earnings rose from \$22.64 for a 41-hour week in 1941 to \$39.00 for a 44-hour week in 1945, a gain of nearly 70% in take-home pay. Simultaneously output per man-hour rose to an all-time high to partially offset this wage burden.

Although furniture factories can quickly reconvert from war work to peacetime production, the supply of household furniture after V-J day showed little improvement due to a shortage of manpower and a scarcity of lumber and upholstery fabrics. At the close of the year returning veterans were reapplying for jobs in furniture factories, the army and navy were reducing their lumber and fabric requirements and all indications pointed to capacity production of household furniture by the end of the first quarter of 1946.

Prices set by the Office of Price Administration (OPA) in late Dec. 1945 encouraged manufacturers to return to the production of low-priced furniture. The new prices allowed manufacturers 20% more for low-priced lines, 13% for medium-priced and 6½% for their highest priced goods. Upholsterers were granted smaller increases, 7% and 4%. This brought low-cost furniture prices up 25% above 1941, medium-priced up 18% and the top bracket of each line up 11½% for case goods, but only 12% and 9% for upholstered goods, above the 1941 price-freeze level.

During 1946 few factories were expected to be ready to export any of their output but thereafter U.S. furniture might find its way to Europe as well as Mexico and South America where a small part of each year's output was sold before World War II. England and Canada were returning rapidly to normal furniture production and factories in Italy and Belgium were coming back into production, but Germany's furniture industry was reported prostrate and Russia's badly disrupted. (See also INTERIOR DECORATION.)

FILMS.—*Furniture Craftsmen* (Encyclopædia Britannica Films Inc.).  
(J. A. G.)

**Furs.** The fur industry of the United States was active during the first half of 1945. There was a strong demand for skins except opossum, skunk, raccoon, red fox and a few other long-haired furs. All other furs of North American origin were in demand. There was a good market for South American nutria

and spotted cats. Some furs from Russia and Europe reached the U.S. market late in the year but the quantities were not great and no official import figures were available. London began to import raw furs in the fall of the year and became an active buyer in Canada and the U.S. The import of Persian lamb in 1945 during the period January to October inclusive totalled 4,928,482 skins and these imports were valued at \$45,650,843. These represented imports of raw lamb skins from Russia, Afghanistan and South-West Africa. Russian skins imported totalled 741,458 skins in the above period, valued at \$7,434,839. Imports from Afghanistan totalled 2,275,871 skins valued at \$26,106,220 and from South-West Africa 1,911,153 skins valued at \$12,109,784. Lamb skins from other sources were comparatively small. Imports of rabbit skins were greatly reduced from normal levels but prospects for a resumption of more normal trade with all foreign countries including China were greatly enhanced late in the year.

The American Fur Merchants association reported a total of \$59,388,890 (incomplete) in member sales for the 12-month period Dec. 1944 to Nov. 1945. This total compares with \$44,262,599 in the corresponding period Dec. 1943 to Nov. 1944. This gain was largely due to an increase in prices as well as sales. In addition there were other imports and exports which did not come within the association activities and were, therefore, not recorded in the association figures.

Many new and several old sources of supply were opened during the last quarter of 1945. The ending of World War II in Europe and Asia was the signal for the U.S. industry to regain quickly part of its former foreign markets. The demand in the U.S. for fur apparel was strong. Popular furs such as muskrat, in various dyed shades, Persian lamb (black and gray), mink (wild and ranch), beaver, nutria, Alaska seal and broadtail were the favourites followed by Indian lamb and the increasingly popular mouton.

Rabbit sold well but was slightly in eclipse with the rising of the mouton star. There was a persistent consumer demand for all types of better quality and luxurious fur apparel. The demand was at times stronger than the supply on such items as muskrat, mink, mouton, platinum fox and such luxurious items as stone marten, Russian sable and U.S. and Canadian marten.

The breeding of mink and fox was well maintained in spite of difficulties. Wild mink remained in favour throughout the year and sold at auction up to \$60 and over for finest Canadian skins. Ranch mink was in excellent demand and brought various prices for the best skins between \$50 and \$60. The mutation minks were more numerous and in excellent demand. A new mutation, royal pastel, was introduced at Seattle, Wash., but was not to be sold until Feb. 1946.

The end of the war in Europe and Asia brought a general feeling of confidence to all branches of the fur farming industry. The outlook for 1946 was encouraging with a great revival in the fur farming business anticipated. The year 1945 brought relief to the fur industry in the fact that men released from the army and navy returned to the fur business. They were badly needed since the beginning of 1945 found the number of workers available to the trade at a low point. It was only through the continuous efforts of the workers that production, even though below normal, was maintained. No official production figures were available at the end of the year but the trade had little or no unemployment and this applied to all branches of the trade in all parts of the United States.

According to U.S. government department of internal revenue figures, the fur industry paid \$52,172,280.67 in taxes for the first nine months in 1945, which amount represented 20% of all money collected at retail on the sale of taxable fur and fur-trimmed apparel. This was a gain in revenue as compared with

the amount of tax collected during the corresponding period in 1944 and which totalled \$37,076,362.04. The figures for the 12-month period were not available. The unions gained during the year with new and favourable labour contracts granting them further security of jobs and minor advantages but no official pay increase above prevailing rates. There was a gradual increase in the number of workers who returned following discharge from the army and navy. It was estimated that about 15% to 20% more workers were available to the trade the last half of the year.

**FWA:** see FEDERAL WORKS AGENCY.

**Galen, Clement August von** (1878– ), cardinal archbishop of Munster, was born at Dinklage, Westphalia, Germany, on March 16. He was ordained in 1904, and named bishop of Munster in 1933.

One of the most outspoken and fearless opponents of nazi doctrine and practices, Bishop von Galen never failed to protest to Hitler by telegram or letter whenever the latter violated the concordat he had signed with the Vatican. He condemned from the pulpit and in his pastoral letters the unauthorized "murders" of invalids and the mentally ill. He vehemently denied the charge that all the German people were "equally responsible" for the crimes and atrocities committed during the war. His episcopal palace destroyed by the nazis, he retired to a Catholic hospital at Sendenhorst where he resided until peace was declared.

It was revealed on Dec. 23, 1945, that he was among the 32 new cardinals appointed by Pius XII. He was created and proclaimed a cardinal at consistory on Feb. 18, 1946.

**Gambia:** see BRITISH WEST AFRICA.

**Gandhi, Mohandas Karamchand** (1869– ), Hindu nationalist leader, was born at Porbandar (Kathiawar), India. For his biography, see *Encyclopædia Britannica*. On Jan. 22, 1937, Gandhi announced his retirement from active Indian politics, but by 1940 he was as prominent as ever in Indian affairs of state. The All-India congress on March 20, 1940, delegated to him the direction of negotiations with Great Britain for national independence. On Sept. 17, 1940, the congress committee elected Gandhi its leader. In April 1941, he announced that the congress had temporarily abandoned its aim of independence for India, but he reaffirmed his personal policy of nonviolence. On Dec. 30, 1941, Gandhi resigned from its leadership.

On March 27, 1942, Gandhi conferred with Sir Stafford Cripps; later he rejected the latter's proposals for Indian post-war independence. On Aug. 9, after the All-India Congress party had approved his proposals for a civil disobedience campaign, Gandhi was arrested with 200 other Indian leaders and was held as a political prisoner in the Aga Khan's palace in Poona. He was released in May 1944 because of failing health. Gandhi warned (Feb. 18, 1945) that a new and bloodier war would come about unless India and governments in similar positions were given their independence. Several days before the Simla conference proposed by the viceroy of India, Field Marshal Viscount Wavell, Gandhi said the time had come when he should step aside as leader of India's independence movement. While he approved the parley (June 19) as a "great advance," he did not attend. Some sources ascribed his refusal to attend to Wavell's rejection of his suggestions for changes in the composition of the proposed Indian council. (See also INDIA.)

**Garnet:** see ABRASIVES.

**Gas, Natural.** The marketed production of natural gas in the United States increased from 3,414,689,000 cu.ft. in 1943 to 3,780,232,000,000 in 1944; the corresponding figures for domestic consumption were 3,403,479,000,000 and 3,766,207,000,000. The small differences between production and consumption represent exports, mainly to Mexico. The over-all classification of types of consumption remained substantially unchanged at 6% for commercial, 15% for domestic and 79% for industrial uses, but consumption by petroleum refineries, carbon black plants and public utility power plants ran well ahead of the industrial average, while portland cement showed a decrease. The proportion of the output treated for the recovery of natural gasoline declined from 99% in 1940 to 89% in 1943 and 88% in 1944.

The figures above include only marketed output; gross output in 1943, in addition to the marketed production, included 824,803,000,000 cu.ft. used in repressuring oil fields, 18,953,000,000 put back into the ground for storage, and 624,175,000,000 of loss and waste, making a gross total of 4,942,560,000,000, of which 65% was from gas wells, and 35% from oil wells. No figures were available on production in 1945, but the recovery of natural gasoline in the first half of 1945 was 17% greater than in the same period of 1944, indicating a similar increase in gas production.

Canadian production of natural gas increased from 44,276,000,000 cu.ft. in 1943 to 45,957,000,000 in 1944, and to 37,601,000,000 in the first three quarters of 1945. (G. A. Ro.)

**Gas Turbines:** see POWER ENGINEERING.

**Gaulle, Charles de** (1890– ), French soldier and leader of the forces of Fighting France after the armistices of June 22–24, 1940, graduated from St. Cyr military college at Paris shortly before the German invasion of France in 1914. Wounded three times during World War I, he was captured by German troops at Verdun in 1916, but escaped and saw further action on the western front and in the near east. After 1918, De Gaulle tried to persuade France to mechanize its armies, but the conservative French general staff preferred to place its trust in static defense. When German mechanized armies skirted the Maginot line and overran France in May–June 1940, De Gaulle fled to London, formed, June 23, 1940, a French exile regime, and rallied many French colonies to the Allied cause. In Sept. 1941 the Free French National council was formed with De Gaulle as its president. He aligned his policy with the U.S., Great Britain and Russia and declared his council at war with Japan, Dec. 8, 1941. After Adm. Jean Darlan's assassination, Dec. 1942, De Gaulle shared power in North Africa with his rival, Gen. Henri Giraud, and on June 3, 1943, the two leaders were co-presidents of the newly formed French Committee of National Liberation. But in November, Giraud resigned, leaving De Gaulle in full control. By April 1944, De Gaulle was made supreme commander of French armed forces. He returned to Paris after its liberation and was acclaimed by the populace. On Oct. 23, U.S., Britain, Russia and Canada recognized his regime as both the *de facto* and *de jure* authority for France.

With the defeat of the reich in 1945, De Gaulle reiterated that France must be given "proper recognition" as a great power. He also maintained that the Ruhr and Rhineland should be internationalized. In June, he exchanged bitter recriminations with Churchill over Britain's temporary assumption of

authority in the Levant and in August he visited Pres. Truman in Washington where the two leaders agreed on the necessity of "even closer co-operation" in the future. The French national elections held Oct. 21 were interpreted in some quarters as a victory for De Gaulle personally, although the communists and socialists emerged as the two strongest parties. In accordance with procedure legalized by the elections, De Gaulle resigned Nov. 6 and was unanimously elected interim president of the provisional government by the new constituent assembly.

**Gay, Maisie** (1883-1945), London-born musical comedy and revue actress. She first appeared at Blackpool in the chorus of Seymour Hicks's *The Cherry Girl* in 1903 and within a year was playing Nan in George Edwardes' *The Country Girl*. In three years she played the part more than 1,000 times and became a nationally-known actress. She subsequently played in *Our Miss Gibbs* and *The Quaker Girl* and in many Cochran and Charlot revues. Her most notable creation was the Cockney character Mrs. 'Arris, the renowned invisible companion of Mrs. Gamp. Ill-health caused her premature retirement in 1930. Her real name was Mrs. Harris, her husband being Oscar Harris, theatre manager. She died at Kingsdown, Box, Wiltshire, Sept. 13.

**Gayford, Oswald Robert** (1893-1945), British air force officer, was born May 18. He attended Bishop's Stortford school, Herts., Eng., later joined the royal navy as a seaman and served in that capacity until 1916 when he was commissioned as an observer in the royal naval air service. Following World War I, he saw service with the R.A.F. in British Somaliland and in the near east. Commodore Gayford, who was graduated from the R.A.F. staff college in 1930, became commander of R.A.F. long-range experiments in 1931. He set a world long-distance flight record in 1933 of 5,339 mi. in 57 hr. and 25 min., and some five years later a fleet of three bombers under his command set a new record, flying nonstop 17,162 mi. from Ismailia, Egypt, to Port Darwin, Austr., in 52 hr. He was attached to the air ministry staff, 1936-37, and was commander of an R.A.F. bomber station, 1939-41. He died Aug. 10, according to a London report.

**Geiger, Roy Stanley** (1885- ), U.S. marine corps officer, was born Jan. 25 in Middleburg, Fla. After graduating from Stetson university, Deland, Fla., in 1907, he enlisted in the marine corps and was commissioned a 2nd lieutenant in 1909. During World War I he served with the 1st marine aviation group in France. A graduate of the Command and General Staff school, the Army War college and the Naval War college, he directed marine aviation, 1931-35. In World War II Geiger commanded all army, marine and navy aviation units at Guadalcanal, 1942, and the following year it was disclosed that Maj. Gen. Geiger had succeeded Lt. Gen. Vandegrift as commander of army and marine forces on Bougainville; in July 1944 he commanded the expeditionary force that reconquered Guam Island. Geiger also headed marine forces in the Okinawa landings, April 1, 1945. His promotion to the rank of a lieutenant general was confirmed June 19, and three days later (June 22), he was made commander of the Pacific fleet marine force. Geiger opposed the war department proposal for a merger of the armed forces (Dec. 8) and also objected to the establishment of a separate air force which he maintained was the real purpose of the proposed merger.

**Gems and Precious Stones.** Conditions during World War II more or

PEARLS worth an estimated \$25,000, cupped in the hands of a U.S. soldier stationed on Bahrein Island, centre of the Persian Gulf pearl trade. The holder, while enjoying pearl diving as a recreation during 1945, undoubtedly did not own the pearls

less disorganized the gem industry, except insofar as the stones in question might have had industrial uses applicable in promoting the war program. For this reason diamonds (*q.v.*) fared better than other gems, and sapphires were also in some demand.

The gem-producing areas of Burma, Siam and Indo-China were in enemy hands, and presumably were operated only to a minor degree, if at all. In Ceylon and Madagascar graphite was more important than gems, and had priority on labour. Nothing was heard from the Indian ruby and sapphire fields, but it was possible that the U.S. troops in India provided some market and encouraged some output. The Colombian emerald mines were not operated for several years.

In the United States 4,500 oz. of sapphires were produced, mostly of industrial grades. The estimated total value of crude gem production declined from \$240,000 in 1941 to \$67,000 in 1943 and \$41,000 in 1944. (See also MINERALOGY.)

**General Education Board:** see SOCIETIES AND ASSOCIATIONS: *Rockefeller Foundation*.

**General Federation of Women's Clubs:** see SOCIETIES AND ASSOCIATIONS.

**Genetics.** The most significant advances in genetics in 1945 were made in studies on micro-organisms. S. Spiegelman, Carl C. Lindegren and G. Lindegren reported a new case of cytoplasmic inheritance. They hybridized two yeast species and showed that a gene-determined enzyme which fermented the sugar, meliobiose, could be transmitted indefinitely through the cytoplasm as long as the meliobiose substrate was present, even in the continued absence of the gene which initiated the enzyme formation. Millislav Demerec and Ugo Fano discovered more than 700 mutations in the bacterium, *Escherichia coli*, each mutation making the bacterium resistant to one or more of seven strains of bacteriophage. S. E. Luria found mutations in two of these strains of bacteriophage which were able to attack the mutant bacteria resistant to the original phages.

**Human Genetics.**—William G. Lennox, E. L. Gibbs and Frederic A. Gibbs studied the electroencephalograms, brain waves, of 55 pairs of monozygotic and 19 pairs of dizygotic twins. They found that there was an agreement in physical and brain wave tests of identity in about 90% of the cases studied.

Most pairs of identical twins had brain wave records markedly similar in character. M. Zlotnikoff described a human bilateral mosaic, a woman 24 years old, with the right side of the body normal and the left side heavily splotched from head to foot with heavily pigmented areas. B. Glass pointed out that the case could be most satisfactorily explained as a dominant mutation in one cell at the two-cell stage of development. E. B. Sonn and Alexander S. Wiener published four pedigrees of the transmission of one of the rare Rhesus factor alleles and three pedigrees of another of these rare alleles. Laurence H. Snyder, M. D. Schonfeld and E. M. Offerman reported that a significantly high proportion of mothers of 122 feeble-minded children were Rh negative. This would seem to indicate that the Rhesus factor is concerned in some cases of feeble-mindedness.

**Cytogenetics.**—B. M. Slizynski published a new map of the fourth salivary chromosome of *Drosophila melanogaster* with about 130 bands. C. D. Darlington and L. F. La Cour showed that there was an interplay between X-ray effects on the cytoplasm and nucleus of plant cells and that this was dependent upon changes in the amount and form of nucleic acid in the cell. E. B. Lewis demonstrated in *Drosophila melanogaster* that the closely linked genes, star and asteroid, represented repeated loci which have become established in the species. The two loci exhibited position effects.

**Population Genetics.**—S. Gershenson investigated mixed populations of the mutant black hamster and the normal type in the Ukraine over a six-year period. From data based on more than 1,000,000 specimens he concluded that the black hamster was increasing in the west and decreasing in the east. Significant seasonal fluctuations also occurred. From an extensive study of *Drosophila melanogaster* populations in five areas of the United States Philip T. Ives found that from 45% to 67% of the second chromosomes carried lethals or semilethals. He concluded that the species breeds in large populations in the U.S. Harrison D. Stalker studied populations of the fly, *Scaptomyza graninum*, from New York and Missouri and found a higher number of recessive mutants present than in populations of *Drosophila*.

**Hybridization and Speciation.**—By hybridizing tobacco, *Nicotiana tabacum* and *Nicotiana glutinosa* D. U. Gerstel was able to transfer to tobacco a chromosome which carried a factor resistant to mosaic disease. S. G. Stevens found that leaf shape in new world cottons was controlled by a multiple allelic series containing at least four members. These four alleles were differentially distributed to the three species studied, and their phenotypic expression depended on the genetic background of each species. William H. McGibbon hybridized Muscovy and mallard ducks and found that the former species contained some eight cellular antigens not present in the latter. Malcolm R. Irwin and Leon J. Cole demonstrated through hybridization and subsequent backcrosses that cellular antigens specific to the Senegal dove segregated at random in the backcrosses. They concluded that the nine or more chromosomes carrying these factors paired normally with their ringdove chromosome partners in the hybrids. John T. Patterson and Theodosius Dobzhansky crossed two subspecies of *Drosophila pallidipennis*, one from Brazil and the other from Mexico. The subspecies crossed readily but male hybrids were completely sterile. They concluded that "the different components of the process of speciation characteristic for the genus *Drosophila* are largely independent."

## Geography.

The end of World War II in 1945 found most geographers in an introspective frame of mind. The unprecedented demands placed upon the field of geography during the course of the conflict had on the whole been successfully met, and Allied forces had been provided with the foreign geographic intelligence they had required. The stresses and strains of the years of war had, however, done two important things: (a) revealed certain shortcomings in previous geographic training programs, and (b) introduced new techniques and suggested new avenues of development.

It appeared likely, in 1945, that during the coming years of peace a degree of change would take place in geographic discipline, probably along four principal lines. (1) Graduate training programs in the universities would undergo some revision, some changes in emphasis. (2) Available stores of geographic research materials would be bolstered by the release from government files of declassified intelligence reports and maps. (3) Possibilities inherent in "team research" might be further explored. (4) Emphasis upon the field of maps might be increased.

**Revised Training Programs.**—Wartime administrators had noted three chief deficiencies in the performance of geographers. First, there had often been a lack of ability to sift from available information those facts particularly relevant to the problem at hand.

This, though by no means confined only to geographers, had been serious in view of the breadth and diversity of the materials handled by them.

More experience in "problem" assignments at the graduate level appeared to be indicated.

Second, a lack of facility in foreign languages and an unfamiliarity with foreign publications was also a difficulty. Again, greater emphasis in this type of training appeared to be the answer.

Third, there had seemed to be a tendency on the part of some geographers toward superficiality in treatment of func-

STAGE SET showing a huge miniature of Japanese industrial targets, built on a scale of 1 foot to the mile. From this and similar sets, motion pictures were made for briefing B-29 pilots in the bombing of Tokyo, Nagasaki, Hiroshima and Yokohama, it was revealed in 1945

tional problems of various types. This had apparently stemmed from a lack of specialization in graduate study in topical fields, as for instance transportation, minerals, etc.

**Augmented Research Materials.**—The staffs of several intelligence agencies had co-operated during the war in the preparation of a series of reports on specific areas of critical importance. These reports, taken together with numerous accompanying maps, constituted important additions to existing geographic knowledge, and appeared likely to be released. Moreover, large federal mapping agencies, which had contributed much toward adequate coverage of foreign areas, were already taking steps to release surplus stocks of maps.

**Further Use of Team Research.**—A troublesome characteristic of wartime problems had been their complete lack of respect for the boundaries among academic disciplines. As a result, workers in different fields had found themselves compelled to pool their resources—to engage in what was described as “team research.” Under conditions of controlled research and direct responsibility, this technique had met with considerable success, producing results in short periods of time. In 1945, viewing this experience in retrospect, geographers were weighing the possibilities for successful application of team research under conditions of peace in the universities and research foundations, as well as in the government.

**Increased Effort in Maps.**—The proverb “One ‘picture’ saves a thousand words” never carried a more pointed application than during World War II. As geographers developed skill in cartography, maps became more and more important to effective reporting of geographic intelligence. Skills gained during the war would not be lost, and it appeared probable not only that maps would increase in importance to research, but that greater emphasis would be placed on cartography in geographic training programs.

Large numbers of foreign maps had been made available during the war by the development of an aggressive procurement policy in foreign areas. These maps, covering a wide range of topics and areas, were in 1945 a forceful reminder to United States geographers that U.S. cartography had lagged behind that of certain other nations. Furthermore, geographers learned that a great store of map intelligence relating to foreign areas was being produced abroad. It appeared probable that the demand would continue for these maps and that they would be made increasingly available both through government and university efforts.

It appeared possible in 1945 that employment horizons for trained geographers would be broadened in the postwar years. Geographers leaving government employ were turning not only toward educational institutions, but also to the fields of industry and commerce. A number of geographers, particularly younger men who had received much of their experience in practical problems during the years of war, were, at the conclusion of hostilities, moving into employment in large corporations. The field of air transportation, for example, stimulated by the war and expanding on a large scale into foreign commerce for the first time, apparently constituted a receptive field for the application of geographic training. Other businesses, planning expansion into foreign markets in the face of increasing competition, were also indicating interest in the application of the skills of economic geography to their various problems. (See also NATIONAL GEOGRAPHIC SOCIETY; SOCIETIES AND ASSOCIATIONS.)

**FILMS.**—*Our Earth; Far Western States; Middle States; Northeastern States; Northwestern States; Southeastern States; Southwestern States* (Encyclopædia Britannica Films Inc.). (R. S. McC.)

**Geology.** The year 1945 witnessed a return from predominantly wartime pursuits of many geologists to more

normal peacetime interests, although the literature on geology reflected to a large extent the concentration of effort on strategic minerals during World War II.

Concrete illustrations of some of the applications of geology in Great Britain during the war were brought out by E. B. Bailey in the *Journal of Geology* for May 1945. The record of the far-flung activities of the United States Geological survey during the world conflict was not completely disclosed, but it was known that this organization played an important role at the battlefronts as well as behind the lines.

The improvements in technique in prospecting, and of map making and interpretation on the basis of aerial photographs developed during the war was expected to be a boon to geology and the mineral industry for many years to come.

An important book of the year for those interested in the mineral industry in war and peace was *Minerals of Might* by W. O. Hotchkiss. A striking assertion was, that mineral production during the previous 30 years (1915–1945) was as great as that during all the earlier history of man.

It remained to be determined at the council table whether the principle of equal access to mineral raw materials to the nations of the world, victors as well as vanquished, would prevail or if the policy would persist which had caused so many international festers to form in the past.

As a result of the rapid depletion of the reserves of mineral resources during the world conflict and the abnormal pent-up, civilian demand for mineral products, geologists were expected to be employed by industry for exploration and exploitation in much larger numbers than before the war. There was a more general realization that effective discovery and development of mineral deposits required the services of highly trained technicians. The presidential address of J. M. Boutwell on “Economic Geology” which appeared in the Nov. 1945 issue of the magazine bearing the same name was pertinent in this respect.

The problem of conserving known, waning natural resources, including soils, is as much a geological endeavour as the finding of new reserves. All phases of mineral exploration and development were also requiring more research. All these factors presage a growth in opportunities for well-trained geologists which could not be foreseen in prewar years. The greater responsibilities of geologists, both pure and applied, called for a greater effort on the part of educators in stimulating interest in the subject and in training men and women for the profession.

The increase in demand for well-trained geologists, coupled with the abnormally low production of scientists by colleges and universities during the later war years, promised to create a serious shortage of personnel for several years. Some factors which would tend to alleviate this situation are: (1) the return of a large number of veterans to industry and to educational institutions and (2) the awarding of graduate scholarships and fellowships in larger numbers than usual. The National Research council was taking the lead in the latter program.

The revised curricula for geology and geological engineering of many colleges and universities gave greater emphasis to field courses designed to fit the students more satisfactorily for practical work.

The volume of textbooks and other contributions to geology fell off noticeably during 1945. To what extent this was due to paper shortage was not revealed, but it was believed that there was a dearth of manuscripts submitted as a result of the all-out war effort as well as difficulties of publication.

Probably the most important additions of general interest to the field of geology during the year were the books: *Principles of Physical Geology* by Arthur Holmes; *Volcanoes as Landscape Forms* by C. A. Cotton; *The Story of the Great Geologists* by the Fentons, Carroll Lane and Mildred Adams; *Food or Famine, The Challenge of Erosion* by W. Shepard; *Fortress Islands of the Pacific, Their Geography and Strategic Importance* by W. H. Hobbs; and the Daly volume of the *American*

*Journal of Science*, entitled *Problems in Geology and Geophysics*, a symposium comprising 26 topics by 28 authors.

Three stimulating articles of 1945 were: (1) "Late Geologic History of the Pacific Basin," by H. T. Stearns, which appeared in the November issue of the *American Journal of Science*; (2) "Lithology of the Sea Floor off Southern California," by K. O. Emery and F. P. Shepard, in the April *Bulletin of the Geological Society of America*; and (3) "Erosional Development of Streams and Their Drainage Basins; Hydrophysical Approach to Quantitative Morphology," by R. E. Horton in the March number of the *Bulletin* of the same society. The latter contribution is a masterly analysis of stream development based upon hydrodynamic concepts.

The May 1945 issue of the *American Journal of Science* presents a symposium of ten papers on loess, covering such subjects as properties, character, types, origin and significance in the classification of soils.

In the field of volcanology the studies of the active Mexican volcano, Parícutín, being conducted under the direction of the United States Committee for the study of Parícutín Volcano, National Research Council, in co-operation with a corresponding Mexican committee are yielding valuable results. Three fruitful papers by investigators involved in the project appeared in the Oct. 1945 *Transactions of the American Geophysical Union*, viz.: (1) "The Genetic Significance of Parícutín" by L. C. Graton; (2) "Geologic Setting of Parícutín Volcano" by Howel Williams; and (3) "Observations on the Preservation of Plants in the Parícutín Area" by Erling Dorf. (See also MINERALOGY; PALAEONTOLOGY; SEISMOLOGY.)

**George VI.** Repeated ovations from great London crowds outside the floodlit balcony of Buckingham palace, where he appeared with the queen and the two princesses on the victory nights of May and Aug. 1945, marked the re-emergence of King George VI from his mostly concealed war-time activities to full public exercise of his royal functions. Both victory rejoicings were followed by a state drive to St. Paul's cathedral for a national thanksgiving service. As part of the May celebrations the king, with the queen and princesses, drove through east and south London. Several historic precedents were set by the king during ceremonial visits to the outlying self-governing parts of his home realm. On June 7 and 8, accompanied by the queen, he spent two full days in the newly-liberated Channel Islands. A month later, this time with Princess Elizabeth also, the king and queen went (July 4-6) to the Isle of Man where the king, first British monarch to do so, presided over the 1,000-year-old Tynwald, the annual open-air reading of the laws. Finally, on July 17 the king opened the Northern Ireland parliament, the first time this assembly had been so honoured.

On Aug. 2 at Plymouth, the king met President Harry S. Truman, calling there on his way home from the conference at Berlin. Visits were exchanged on H.M.S. "Renown" and U.S.S. "Augusta." Messages of congratulation with all the principal Allies were exchanged on the conclusion of peace, and exiled royalties returning to Europe paid calls at Buckingham palace. Home ceremonial occasions included a farewell parade on Dec. 3, 1944, in Hyde Park of 7,000 men in representative detachments from the home guard, then standing down; another, also in Hyde Park, on June 10, 1945, of 2,500 men and women of the civil defense services, on disbanding; and on May 21 the march past Buckingham palace of a two-mile procession of British Legion veterans of World War I. Resuming some of his more social movements the king saw one of his horses win a race at Ascot.

The king broke his autumn holiday at Balmoral for three state visits. With the queen he went on Sept. 25 to open at Ladybower, Derbyshire, the last reservoir of the Derwent valley water scheme which jointly supplies the cities of Sheffield, Nottingham, Leicester and Derby. On Sept. 26 and 27 their majesties paid their second state visit of the year to Edinburgh for victory ceremonies and on Sept. 28 the king spent a day with the royal navy at Rosyth. On Nov. 13 and 14 the king and queen visited Wales in state.

During the flat-racing season which ended on Oct. 31, the king won 13 events with a total of £7,738 in prizes.

On Oct. 25 the king spoke at the centenary celebration in the Albert hall, London, of the Imperial College of Science and Technology and his tribute to science was broadcast, and on Dec. 4, with the queen, the king attended at St. Paul's cathedral the royal artillery memorial service to those who had fallen in the two world wars. (See ENCYCLOPÆDIA BRITANNICA.)

(L. Du.)

**Georgia.** A southern state, one of the original states of the union; popularly called the "Empire State of the South." Area 58,876 sq.mi. (including 358 sq.mi. of inland water); pop. (1940) 3,123,723; urban 1,073,808 (34.4%); rural 2,049,915 (65.6%); native white 2,026,362 (64.9%); Negro 1,084,927 (34.7%); foreign-born white 11,916 (.4%); other races 518. Capital, Atlanta (302,288); the next largest cities are Savannah (95,996); Augusta (65,919); Macon (57,865). On July 1, 1944, the bureau of the census estimated the population of the state at 3,223,727.

**History.**—The general assembly met from Jan. 9 to March 4, 1945. The primary accomplishment was the preparation of a new constitution for the state. This constitution was ratified by the people on Aug. 7. It provided among other things for repeal of the poll tax; establishment of the office of lieutenant governor; allocation of all state revenues to the general treasury from which appropriations were to be made under budgetary control; granting constitutional status to the public service commission and to the state board of correction; permitting towns and cities to issue certificates of indebtedness to acquire power plants of their own.

A special session was held in the summer of 1945 for the purpose of writing into the constitution a provision permitting a governor to run for re-election. The effort failed. Georgia governors under the new constitution at the end of 1945 could not run for re-election until four years had elapsed from the end of their term of office.

State officials at the end of the year 1945 were: governor, Ellis G. Arnall; attorney general, Eugene Cook; secretary of state, John B. Wilson; treasurer, George B. Hamilton; comptroller general, Homer C. Parker; chief justice, R. C. Bell; superintendent of schools, M. D. Collins; U.S. senators, Walter F. George and Richard B. Russell, Jr.

**Education.**—There were in 1943-44 (latest figures available at end of 1945) 363,602 white and 230,174 Negro students enrolled in the elementary schools; 108,832 white and 25,849 Negro students enrolled in the high schools. There were 1,894 white schools (including 854 high schools) and 3,121 Negro schools (548 high schools). There were 10,194 white and 6,221 Negro teachers of elementary grades; 4,982 white and 1,357 Negro teachers of high schools.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—As of June 30, 1945, there were 67,044 persons who received \$9,058,771.50 in old age assistance; 9,987 dependent children, benefits, \$1,181,961; 2,030 blind, benefits, \$348,562.50.

Unemployment benefits paid in Georgia from Jan. 1, 1939, to Oct. 20, 1945, inclusive, amounted to \$18,001,084.67. Payments issued from Jan. 1, 1945, to Oct. 20, 1945, inclusive, amounted to \$1,481,796.00 and were paid to approximately 20,000 persons. As of Oct. 20, 1945, the state of Georgia had a balance in the unemployment compensation trust fund of \$79,504,795.74.

The following budget allotments were made for welfare institutions for the fiscal year ending June 30, 1945: board of pardons and paroles, \$97,176.12; prisons, state department of corrections, \$766,131.16; public welfare benefits, \$5,424,566.32; state institutions, \$2,564,886.79.

At the Milledgeville State hospital on June 30, 1945, there were 8,442 patients; at the Boys Training school, 287; the Girls

Training school for white, 110; the Girls Training school for Negroes, 17; the Georgia Training school for mental defectives, 422.

**Communication.**—There were in Georgia on Jan. 1, 1945, 89,955.4 mi. of unpaved roads; 9,741.9 mi. of paved roads. Expenditures by the state highway department for the fiscal year 1944-45 amounted to \$4,446,878.77 for construction and \$5,152,912.87 for maintenance. Budget allotment to the state highway department for the fiscal year ended June 30, 1945, amounted to \$9,186,180.34; highway grants to counties for the period were \$4,300,000; memorandum allotments to maintain normal annual appropriation for highways for the fiscal year ending June 30, 1945, \$2,703,819.66.

There were in 1944 (latest figures available in 1945) 6,454 mi. of railways in the state. At the beginning of 1945 there were 40 civilian airports in Georgia. Approximate air route mileage within the state amounted to 2,000 mi. On Oct. 1, 1945, there were 289,782 telephones operated by the Bell system and 31,953 by independent companies.

**Banking and Finance.**—There were in Georgia as of June 30, 1945, 251 state banks with seven branches. These banks had total resources of \$651,185,875.60; loans and discounts, \$136,607,318.75; demand deposits, \$444,520,357.70; savings deposits, \$77,972,528.41. On that date there were 48 national banks with total loans and discounts of \$164,165,000; demand deposits, \$816,771,000; time deposits, \$138,046,000.

There were 21 building and loan associations reported at the end of 1944 with total assets of \$14,537,551.93.

Total state receipts for the year ending June 30, 1945, amounted to \$63,193,875.80. Chief sources of revenue in order of importance were: motor fuel tax, \$21,052,733.88; income tax, \$14,085,861.79; cigar and cigarette tax, \$4,630,753.28; general property tax, \$4,062,281.97; alcoholic beverage tax, \$3,600,225.22. Total budgetary allotments for operation and debt amounted to \$58,484,816.38. In addition memorandum allotments of \$4,549,332.79 were made bringing budget allotments to a grand total of \$63,034,149.17. The net obligations of the state of Georgia not covered by cash reserves were \$2,146,679.78 on June 30, 1945.

**Agriculture.**—The value of all Georgia crops produced in 1945 amounted to \$387,348,000. This was 4% above the 1944 total and was exceeded only by the all-time high valuation of \$578,000,000 in 1919. The leading agricultural products for the state in 1945 are shown in the accompanying table.

Leading Agricultural Products of Georgia, 1945 and 1944

Crop	1945	1944	Value, 1945
Cotton, bales	665,000	810,000	\$75,145,000
Cottonseed, short tons	266,000	320,000	13,566,000
Corn, bu.	48,678,000	40,802,000	73,504,000
Peanuts, lb.	704,700,000	683,620,000	57,081,000
Tobacco, lb.	108,035,000	93,780,000	43,884,000
Peaches, bu.	8,091,000	4,590,000	23,868,000
Hay, short tons	840,000	710,000	17,133,000
Potatoes, sweet, bu.	8,010,000	8,272,000	16,420,000
Commercial truck crops			12,091,000
Oats, bu.	15,000,000	13,080,000	12,000,000
Pecans, lb.	36,850,000	33,500,000	10,282,000

Source: U.S. department of agriculture.

**Manufacturing.**—No census of manufactures was taken after 1939. There were, in 1939, 3,150 manufacturing establishments in Georgia that produced goods valued at \$677,402,657, employed 170,165 persons, and paid in salaries and wages \$132,188,496.

**Mineral Production.**—In 1944 (latest complete year) Georgia produced 27 different minerals and mineral products including 80% of the kaolin produced in the United States. Value of mineral and mineral products was \$20,195,547, of which \$19,192,547 came from non-metallic minerals. Clays and clay products headed the list in values, \$6,954,021; stone was second,

\$5,037,596. Metallic minerals were valued at \$1,003,000; coal, \$85,000. Industrial and municipal water produced was valued at \$2,000,000 and water used in hydroelectric installations, \$31,700,460.

Minerals produced include agricultural lime, asbestos, barite, bauxite, cement, clay, coal, fuller's earth, gold, granite, iron ore, kyanite, lime, limestone, magnesium sulphate, manganese ore, manganiferous ore, marble, mica, ochre, peat, sand and gravel, silica, slate, stone, talc and umber. (E. C. Gr.)

**German Literature.** No notable literary work appeared in Germany during the catastrophic events of 1945, but a revival of sound intellectual life was seen in the re-establishment of many good German newspapers. More than 20 had begun to appear in the U.S. zone of occupation, representing various shades of political opinion. They were staffed by able young Germans under the supervision of the Allied military authorities, and carried good literary articles and notes as well as ordinary news. An interesting two-day conference of more than 40 editors was held at Marburg on Oct. 21-22.

Goethe's house at Frankfurt was destroyed by Allied bombing, but the Goethe museum and archives at Weimar were fortunately unharmed and were reopened. (S. B. F.)

**Germany.** A country under Allied military government, in central Europe, extending from the Alps to the North and Baltic seas, and lying mainly between the Oder and Rhine rivers. Capital, Berlin (*q.v.*). Chief cities (1939 census): Berlin (4,332,242); Hamburg (1,692,695); Munich (828,355); Cologne (768,426); Leipzig (701,606); Essen (659,871); Dresden (625,174); Frankfurt-on-Main (546,649); Duesseldorf (539,905); Dortmund (537,000). The population of all these cities was considerably reduced as a result of World War II. Religion (1933): Protestants 62.7%; Roman Catholics 32.5%; Jews 0.7%; others 4.1%.

**Area and Population.**—The area of Germany at the end of 1945 was 143,243 sq.mi. with an estimated population of at least 63,200,000, not including the armies of occupation. According to the census of May 17, 1939, the last available source for reliable statistics, the area of the old German reich, not including Hitler's annexations of 1938 and the following years, was 182,471 sq.mi. with a population of 69,622,483.

As a consequence of World War II, many changes affecting the total population of Germany and its dislocation took place between May 1939 and Dec. 1945. Some of the most important changes were the following. By the Allied Potsdam declaration of Aug. 2, 1945, Germany was deprived not only of all Hitler's annexations of territory, but also of all former German reich territory east of the Oder and western Neisse rivers. (See BERLIN CONFERENCE.) Of this territory east of the Oder, the northern half of East Prussia including Koenigsberg was transferred to the soviet union; the rest of East Prussia, together with most of Silesia and Pomerania and a part of Brandenburg, was transferred to Poland. The transferred territory contained about 40,000 sq.mi. and a population in 1939 of 9,300,000, *i.e.*, nearly a quarter of the area and about one-seventh of the population of the old reich. A large part of the men of working age were taken by the Russian armies to perform labour services in the soviet union. During 1945 what was left of this German east-of-the-Oder population—mainly women, old men and children—were uprooted and deported in large numbers to the truncated reich west of the Oder.

In addition, there were deported into the new Germany west of the Oder more than 2,000,000 German-speaking persons who had lived for generations in Danzig, the Polish Corridor, Czecho-

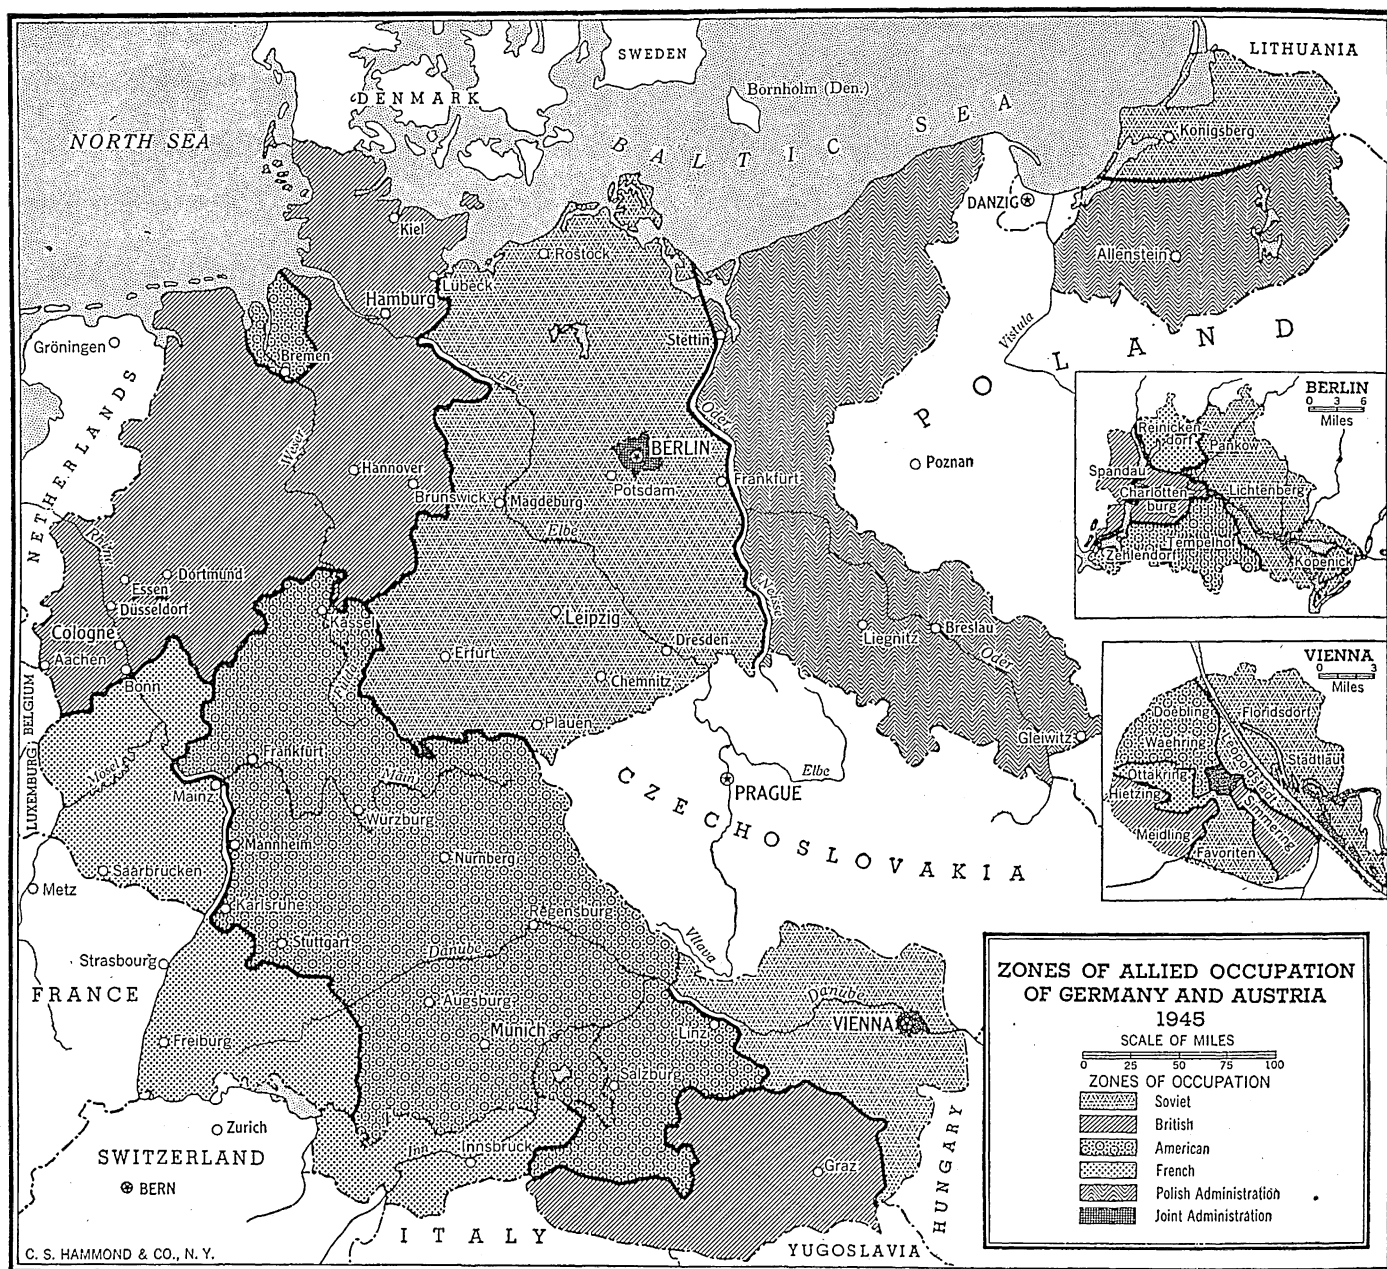

slovakia and Hungary, or who had been transplanted by Hitler during the war from the Baltic provinces and the Austrian Tyrol and given new homes in nazi-conquered lands. It was expected that during 1946 at least 2,000,000 more of these homeless, hungry, destitute deportees would be thrust into Germany to increase the difficulties of the Allied armies of occupation and to aggravate the food and unemployment problems already existing.

In May 1945, there were also 8,600,000 foreign "slave labourers"—6,400,000 civilian workers and 2,200,000 working prisoners of war—whom Hitler had brought into Germany from nazi-conquered lands to labour in the fields and factories in the place of Germans conscripted into the nazi fighting forces. These "displaced persons" were at once liberated by the Allies and repatriated as fast as inadequate transportation and other difficulties allowed. By the end of 1945 there were only about 1,000,000 remaining to be repatriated; these consisted mainly of Poles, Baltic Germans and some Russians, who hated the bolshevists and violently resisted repatriation which would have again subjected them to soviet domination.

The number of Germans in the armed forces who were killed or permanently disappeared and lost may be conservatively

estimated at 4,000,000. In addition, more than 300,000 civilians were killed in air raids. These figures do not include a much larger number who were wounded, permanently disabled, or taken prisoner. More than 2,000,000 German prisoners were detained or transferred abroad to perform labour services in France or Russia. The increased civilian death rate during the war years, because of war privations, disease, suicides, death in concentration camps and purges by the nazi police, was in part offset by the nazi efforts to stimulate the birth rate.

**History.**—The history of Germany in 1945 is the catastrophic story of military defeat, political collapse, and apathetic resignation to Allied military control. The invasion of Germany by the Anglo-U.S. forces across the Rhine and by the Russians across the Oder early in 1945 was preceded by terrific Allied bombing aimed primarily at munitions plants, aeroplane factories, synthetic gasoline works and the whole transportation system. This was so effective that the German armies had little or no air protection, no means of knowing exactly where the Allied armies were striking or rushing forward, and no way of transporting German troops quickly to threatened sectors. As a result, the Allied armies were able to cut behind the German troops and force them to surrender by the hundreds of thou-

Above: GERMAN GOLD RESERVES, estimated at 100 tons, were discovered by troops of the U.S. 3rd army at Merkers, Germany, on April 7, 1945. They were stored in a 2,100-ft.-deep salt mine together with currency and priceless art treasures

Below: MAIN STREET in a German town as it looked to men of the U.S. 3rd army entering in May 1945. Homes lining the street were either totally destroyed or mere shells of brick

Right: CHILDREN of Berlin, foraging in a U.S. army mess hall during 1945, hunt for scraps to supplement their own thin rations

Bottom: VICTIMS of the Belsen concentration camp awaiting burial. Troops of the British 2nd army who liberated the camp on April 15, 1945, are reported to have found 29,000 persons dying of typhus, typhoid, tuberculosis and starvation

sands. On May 7 the Allied terms of unconditional surrender were signed by German officers at Rheims and confirmed next day in Berlin.

As the German armies collapsed or surrendered, many nazi leaders committed suicide, or tried to disguise and hide themselves. Hitler, after having expelled Goering and Himmler from the nazi party because of their efforts earlier to open peace negotiations through Sweden, shot himself in his air-raid shelter in the Berlin chancellery. Eva Braun, whom he had just married, died with him, and their bodies were said to have been so thoroughly consumed by fire that they could not be found. Across the street next day, in the basement of the propaganda ministry, Goebbels gave poison to his six children, and then shot himself and his wife. A little later, Heinrich Himmler, head of the gestapo, and Field Marshal Ritter von Greim, Goering's newly appointed successor as head of the luftwaffe, swallowed the cyanide of potassium which many nazi leaders carried with them in these last fatal days.

On May 1 Admiral Doenitz announced over the Hamburg radio that Hitler was dead, and that he himself, by Hitler's will, had been appointed his successor as reichspresident. The Allies allowed him and some other generals and admirals to exercise authority for three weeks in order to avert complete chaos and to facilitate the surrender and demobilization of the remaining troops. Then, on May 23, Doenitz and some 300 other highest officers and civilian officials were taken into custody at Flensburg in Schleswig. This marked the final end of the third reich, which Hitler had boasted would endure "for a thousand years."

On June 6 the Allies announced that Germany west of the Oder would be ruled for an indefinite period in four military zones, administered respectively by U.S., British, French and Russian authorities. Greater Berlin (341 sq.mi.; estimated pop. 3,200,000) was to be jointly administered by the four Allies. Unity of administration was to be secured as far as possible by a Four-Power Control council sitting in Berlin, but it could act only by unanimous vote of the four Allies, and this often proved difficult to secure. The approximate area and the estimated population of each of the four zones on Dec. 31, 1945, was as follows.

The U.S. zone (43,136 sq.mi.; pop. 17,800,000) comprised Bavaria and west central Germany, and also an enclave territory around Bremen within the British zone. The U.S. zone had a well-balanced economy with both agriculture and industry. De-nazification was carried out more completely there than elsewhere. Fraternization of U.S. troops with the German population was at first forbidden, but later permitted because the prohibition was difficult to enforce.

The British zone (36,869 sq.mi.; pop. 18,900,000) was made up mostly of Prussian territory, and stretched across north Germany from Luebeck and the Baltic sea to the Dutch and Belgian frontiers. It included a larger population and was more highly industrialized than any of the other zones. The British were more inclined than the other Allies to aid some German industrial recovery, in order to give employment and to furnish the country with needed manufactures and with exports with which to buy food and raw materials from abroad.

The relatively small French zone (21,558 sq.mi.; pop. 6,900,000) included two triangular districts separated from each other: Baden and western Wurttemberg in the southwest; and the Saar and Rhineland in the west. The French wanted their zone closely linked to France or placed under international control.

The Russian zone (41,339 sq.mi.; pop. 16,400,000) lay largely between the Oder and Elbe rivers, and included most of Brandenburg, Mecklenburg, and the industrial Saxon and Thuringian

territories. The Russians at once carried off great amounts of industrial equipment from their zone, and began to divide up the large landed estates in order to create small farms.

**Education.**—In the old reich in 1938 there were 51,118 public elementary schools (*grundschule*) with 7,596,437 pupils; 1,563 elementary "middle schools" teaching English and French with 272,635 pupils; 2,282 secondary schools with 670,895 pupils; 10 technical high schools with 9,554 students; and 25 universities with 48,139 students. The nazis also established many special schools for training "leaders," with emphasis on comradeship, sports, nazi ideology and leadership.

As a consequence of the war, practically all education collapsed in the spring of 1945. In Berlin, for instance, 149 school buildings were destroyed and 36 badly damaged. The Allied military authorities at once took steps to rehabilitate the schools by screening teachers for political reliability, printing new textbooks, and restoring or adapting buildings for school purposes. In Berlin, by December, 213 buildings were being used for primary and secondary education, though only 90 were in sound condition. Lack of coal and scarcity of wood throughout Germany made it often impossible to heat the schools, so that some had to be closed in cold weather. Because of the lack of enough new textbooks, some instruction was given by using films.

By the end of 1945 ten universities (Berlin, Jena, Goettingen, Heidelberg, Marburg, Hamburg, Kiel, Halle, Tuebingen, Freiburg) had again begun instruction in some or all of their faculties, medical, theological and technical courses being the first to be reopened. The buildings of the universities of Berlin, Wuerzburg, Cologne, Munich and Leipzig were largely destroyed, and those of several others were so damaged that new quarters had to be found. Great difficulty was experienced in finding satisfactory professors. More students applied for admission than could be accommodated.

**Defense.**—By the terms imposed on Germany the country was left without any army, navy or air forces. All war equipment was delivered over to the Allies or destroyed. Some munition plants were blown up and machinery in war producing plants, so far as it had not already been destroyed by Allied bombing, was either destroyed or confiscated for removal from Germany as part of Germany's reparation payments. Germany was forbidden to have or to build any aeroplanes either for military or commercial uses.

**Finance.**—The unit of currency is the German mark, nominally equivalent to 40.3325 U.S. cents, but actually hardly worth a quarter as much, because of the inflationary printing of new money. After U.S. troops entered Germany, General Eisenhower provisionally fixed the exchange value of the mark at 10 cents. The Allies seized or compelled the delivery of all monetary gold and paper money in the banks. In Jan. 1945, the reich debt was 315,000,000,000 marks; the note circulation had risen to 47,000,000,000 marks as compared with 3,500,000,000 marks in 1933—an inflationary increase from 50 marks per capita in 1933 to 670 marks in 1944. These conditions contributed to widespread "black market" operations in the summer and autumn of 1945.

**Trade and Communications.**—Germany's prewar trade is given in Table I.

Its trade in 1945 was greatly cut down by the loss of reich territory east of the Oder, by the industrial destruction caused by the war, and by the Allied reparations policy. By the Potsdam declaration of Aug. 2 and subsequent enactments, the Allies provided that Germany was to pay reparations, not in long-term payments reckoned in cash as after World War I, but in the delivery of gold, assets held abroad, and—most important—all machinery and equipment of plants making arms and munitions, ocean shipping, synthetic ammonia and gasoline,

Table I.—Imports, Exports and Balance of Trade, 1932–39

	Total Yearly			Monthly Average		
	Imports Million marks	Exports Million marks	Balance Million marks	Imports Million marks	Exports Million marks	Balance Million marks
1932 . . . . .	4,667	5,739	+1,072	389	478	+89
1933 . . . . .	4,204	4,871	+ 667	350	406	+56
1934 . . . . .	4,451	4,167	– 284	371	347	–24
1935 . . . . .	4,159	4,270	+ 111	347	356	+ 9
1936 . . . . .	4,218	4,768	+ 550	352	397	+46
1937 . . . . .	5,468	5,911	+ 443	456	493	+37
1938* . . . . .	6,052	5,620	– 432	504	468	–36
1939† . . . . .	2,755	2,814	+ 59	458	468	+10

\*Figures do not include Austria and Sudeten area.

†Figures are for the first six months of 1939 only.

aeroplanes, aluminum, magnesium, synthetic rubber and various other equipment. The amount of this equipment was to be determined by Feb. 1, 1946, and it was to be removed from Germany within six years.

The purpose of the reparations provisions was mainly threefold: to deprive Germany of all equipment which might help it prepare for another war; to help the countries which Germany conquered and exploited to bring about their own economic recovery and to become strong industrial nations; and to see that Germany would not enjoy a standard of living exceeding that of the other countries of Europe. The effect would be to reduce so greatly Germany's exports, which normally consisted mainly of manufactured goods, that Germany would have great difficulty in acquiring foreign exchange with which to pay for imports of vitally needed food and raw materials. For two or three years Germany would have to be fed in part by the Allies unless its population was to starve; but it was calculated that by 1948 it might have enough exports to pay for imports to make it self-supporting at a standard of living not much below that of 1932—the worst year of the depression.

German railways and rolling stock, as well as the canal system, were largely destroyed by the war, so that lack of adequate transportation was one of the most serious obstacles to any beginning of economic recovery in 1945.

**Agriculture, Manufactures and Mineral Production.**—Germany's prewar agricultural production is shown in Table II.

Table II.—Agricultural Production from 1932 to 1939

(In thousands of short tons)							
	Rye	Wheat	Barley	Oats	Potatoes	Sugar Beets	Fodder Beets
1932 . . . . .	9,219	5,515	3,543	7,330	51,826	8,681	38,014
1933 . . . . .	9,620	6,177	3,823	7,663	48,579	9,456	33,858
1934 . . . . .	8,385	4,996	3,531	6,010	51,566	11,457	37,262
1935 . . . . .	8,243	5,144	3,733	5,936	45,211	11,648	38,262
1936 . . . . .	8,142	4,879	3,747	6,193	51,062	13,332	41,696
1937 . . . . .	7,628	5,534	4,012	6,526	59,083	17,307	44,685
1938 . . . . .	9,329	6,065	4,604	6,916	53,682	18,960	45,966
1939* . . . . .	...	...	...	...	60,119	19,180	43,541

\*Figures for 1939 are estimated. The total grain harvest was estimated at 30,236,089 short tons, i.e., 6.4% more than the total for 1938.

The year 1945 was a poor harvest year because of the war, lack of agricultural manpower and bad weather conditions. Moreover, in losing the territory east of the Oder, Germany lost about 25% of its agricultural production, thus greatly aggravating the food problem in the new smaller Germany where more than 63,000,000 have to be fed as compared with less than 60,000,000 in the same area in 1938.

Germany's prewar mineral production is shown in Table III.

Table III.—Production of Minerals and Manufactured Products, 1933–37

(In short tons)					
	1933	1934	1935	1936	1937
Coal . . . . .	120,737,785	138,234,593	158,170,460	176,099,700	203,374,350
Lignite . . . . .	139,723,800	151,261,354	162,216,783	177,940,872	203,594,810
Iron ore . . . . .	2,857,162	4,787,289	6,662,301	8,344,411	10,793,722
Lead . . . . .	100,309	108,466	134,811	153,220	174,715
Zinc . . . . .	178,573	234,569	225,972	228,948	214,177
Rock salt . . . . .	2,029,665	2,231,276	2,289,698	2,627,663	3,050,064
Potash . . . . .	8,116,014	10,600,488	12,866,597	12,968,119	15,939,258
Pig iron . . . . .	5,783,217	9,608,418	14,160,366	16,867,946	17,592,708
Steel . . . . .	8,149,524	12,788,554	17,651,681	20,492,749	21,370,290

Most of the lead and zinc and about a third of the coal supply was lost by the transfer of Silesia to Poland. The production

of other minerals in 1945 was estimated at 20%–50% of pre-war amounts. What coal was produced went almost wholly to supply the needs of the armies of occupation or of Germany's neighbours, very little being available for the Germans themselves.

**Gerow, Leonard T.** (1888– ), U.S. army officer, was born July 13 in Petersburg, Va. He was graduated from Virginia Military institute, Lexington, Va., in 1911 and was commissioned a 2nd lieutenant on joining the U.S. army. He served in the Mexican campaign and went overseas with the U.S. expeditionary forces to France in 1918. Following the end of World War I, Gerow was stationed in Shanghai and the Philippines. He was chief of staff of the war plans division during the Pearl Harbor incident and until Feb. 1942 when he was promoted to the rank of major general. He went to England in July 1943, where he became commander of U.S. field forces. He later became commander of the U.S. 5th corps (July 1944). Gen. Gerow participated in the Normandy landings in the summer of 1944, the drive on Paris, the Aachen battle and the Ardennes campaign in the winter of 1944–45. In Jan. 1945 he was named for promotion to the temporary rank of lieutenant general and the following March he was assigned to form a new army, the U.S. 15th. Subsequently Supreme Allied headquarters announced that the 15th army would take over the occupation of the U.S. zone of Germany. Gen. Gerow asserted (July 15) that he was leaving the command of the 15th army to become head of a board of U.S. officers to make a detailed study of the war. Testifying (Dec. 5) before the congressional committee investigating the Pearl Harbor attack, Gerow said he accepted the responsibility for not having instructed Gen. Walter C. Short to strengthen the defense measures at Pearl Harbor after the war department warned of the possibility of a Japanese attack.

**Gilbert and Ellice Islands Colony:** see PACIFIC ISLANDS, BRITISH.

**Gilroy, Norman** (1896– ), Cardinal archbishop of Sydney, was born at Sydney (N.S.W.) suburb of Glebe on Jan. 22. At 18 he left Marist Brothers college, Kogarah, to take a position in the telegraphic department of the postmaster general's office. He enlisted in World War I, and served as radio operator on a troopship. He entered seminary immediately after discharge from service, and following his ordination in 1923, went to the Urban College of Propaganda in Rome to complete his studies.

He became secretary to the apostolic delegate to Australia in 1924 and secretary to bishop of Lismore in 1931, and served as chancellor of diocese of Lismore from 1931 to 1935, when he was named bishop of Port Augusta. He was elevated co-adjutor archbishop of Sydney, with right of succession, in 1937, and was designated archbishop of Sydney on March 8, 1940.

He carried on a vigorous campaign against the proposed lifting of the legal ban against the communist party in Australia, which was the object of an intensified campaign among the extreme section of trade unions and other organizations.

He was among those nominated to the Sacred College of Cardinals in Dec. 1945. Created and proclaimed cardinal at

consistory on Feb. 18, 1946, he became the first of Australian birth to be elevated to the sacred purple.

**Girl Scouts.** In 1945 the Girl Scouts, by helping relieve the sufferings of war-torn countries, gave tangible evidence of the good will and friendly attitude of the United States towards neighbours across the sea. Through the Juliette Low World Friendship fund, maintained by Girl Scout pennies, the Koloshan orphanage near Chungking received a gift of \$10,000 and the American Relief for Italy received \$1,000 for the purchase of 7,500 lb. of soap. Girl Scouts assisted in the preparation of 250,000 garments for Philippine war relief, and friendship bags filled with toys, clothing and toilet articles were sent to the bombed out children of Britain.

Plans for continued constructive participation in world affairs were made when the Girl Scouts, having been offered an opportunity to design their own plan of work for 1946, chose projects which emphasized world friendship and international understanding. A new share-the-food project was launched for the purpose of helping relieve the food situation in Europe, and the Scouts raised, harvested and canned more than 1,000,000 qt. of fruits and vegetables for overseas relief. An international division was established to develop more world-wide activities and a member of the division attended the first postwar meeting of the World Association of Girl Guides and Girl Scouts held in Switzerland.

The Scouts continued to alleviate the man and woman power shortage by assisting in homes, nurseries, playgrounds, schools and on farms. The rural program was enlarged to care for more girls in farm sections and plans were in the making for further expansion of the Wing Scout program.

At the end of Aug. 1945 total membership was 1,182,423, an increase of 166,359 over the figure at the end of Aug. 1944. (C. M. R.)

**Glands:** see ENDOCRINOLOGY; MEDICINE.

**Glass.** During the greater part of 1945, the United States glass industry operated under increasing handicaps imposed by wartime conditions. Demand for all kinds of glass products remained high, but orders could not be completely filled. Window glass was an important exception because of low activity in new construction.

Employment did not reach the high level of 1944, because men were not available. On the average, 85,000 persons worked in glass factories in the U.S., earning for the year 1945 about \$125,000,000. Strikes in plate-glass plants seriously reduced employment and production during the closing months of 1945. Because of these conditions, the total value of product fell below the \$550,000,000 mark set in 1944.

Bottles and containers again occupied a leading position in U.S. glass manufacturing, in numbers well over 100,000,000 gross. Further progress was made in making lightweight bottles to save transportation costs, and square jars for milk, which became immediately popular because they economize space. Paper continued scarce for wrapping and cartons; lumber for boxes and crates was lacking; freight traffic was hampered by military needs, by lack of help and by weather conditions in the cold months; certain chemicals needed for colouring and decolorizing remained hard to get. However, the fuel supply was above expectations.

The famous antimonopoly suit brought by the U.S. against holders of patents controlling the container industry, which had been decided against the defendants by the trial court, was reviewed by the supreme court, which sustained the basic findings of violation of the antitrust laws but ordered revisions in the severe injunctions laid. The case was remanded to the lower

court, which was to prepare a final judgment in conformation to the high court's opinion.

The extensive use of radar and radio by the armed forces continued to stimulate developments in vacuum tube and bulb manufacture. New glasses, new alloys and improved techniques changed materially the all-important art of sealing conductors into glass.

As an indispensable material for war, glass increased its usefulness as laboratory apparatus, insulation, aeroplane windows and cowls, bullet-resisting panes and optical glass for instruments. The progressive condition of the industry was attested by the fact that U.S. patents in the glass field, during a year when industrial patents were generally few, increased from 188 in 1944 to 195 in 1945. (S. R. S.)

**Glennon, John Joseph** (1862- ) Cardinal archbishop of St. Louis, was born at Kinnegad, County Meath, Ireland, on June 14. He was ordained at Kansas City, Mo., 1884, and served as vicar general of diocese of Kansas City. Consecrated titular bishop of Pinara and coadjutor bishop of Kansas City June 29, 1896, he was transferred to St. Louis as coadjutor to archbishop, April 27, 1903, and became archbishop of St. Louis Oct. 13, 1903.

Oldest member of the U.S. hierarchy in point of service he looks back upon sacerdotal and episcopal careers that are among the most distinguished in the history of the church anywhere.

World War I saw the intensification of Archbishop Glennon's already amazing activity. He had frequently expressed the hope that the United States might be spared the disasters of war, but once war was declared he threw himself unreservedly into the patriotic works that it required. He was one of the signers of the document of Catholic loyalty and patriotism sent to President Wilson on April 19, 1917.

During World War II, Archbishop Glennon constantly urged civilian defense, as a task for each man "joining with his neighbour to save his community." He stressed defense of U.S. rights and liberties, not only against threats from abroad but against abuse in the U.S.

Nominated to the Sacred College of Cardinals, according to an announcement of Dec. 23, 1945, he was created and proclaimed a cardinal at consistory, Feb. 18, 1946.

**Gliding.** Military gliders participated up to the close of World War II in the European and Pacific theatres, in bringing up supplies to the front, thus hurdling the obstacles of jammed roads and lack of airports. The use of gliders for the evacuation of personnel and wounded was dramatized by the glider rescue on June 29, 1945, of the survivors of a wrecked transport plant, from the hidden valley in New Guinea, using glider pickup technique.

Civilian gliding in the U.S. was stimulated tremendously by the government's releasing for sale the army two-place training gliders. As one of the results, the first One Design Contest with ten Laister-Kauffmann two-place sailplanes competing, took place Sept. 2 and 3 of Labour day week end. The first prize was won by Lieut. Donald Pollard, U.S.N.R., with a soaring flight of 2 hr. and 30 min.

Beginning July 1, 1945, the Civil Aeronautics administration regulations permitted an applicant for a license for powered aircraft to submit glider flight time up to 50% of the required solo flight time for the private license and up to 25% for the commercial license.

The three-day Motorless Flight conference held by the Soaring Society of America, Oct. 12, 13 and 14 at Polytechnic Institute of Brooklyn emphasized the technical contributions of gliding and soaring to aviation. The program covered air frames,

AMBULANCE GLIDER with triple-tiered bunks made better time in evacuating wounded soldiers from the Rhine front than was possible over bad roads during the spring of 1945

cargo gliders, research, design and aerodynamics and glider training. Three more glider pilots, Franklin E. Hurtt, Clarence W. See, Jr. and Paul A. Schweizer earned the Silver "C" award granted by the Soaring Society of America, bringing the total in North America to 49.

On Nov. 4, 1945, Paul A. Schweizer and Franklin E. Hurtt established a new national duration record for two-place gliders, of 9 hr. and 17 min., at Elmira, N.Y. (B. Sk.)

**G-Men:** see FEDERAL BUREAU OF INVESTIGATION.

**Goebbels, Josef** (1897-1945), German propaganda chief, was born Oct. 29 at Rheydt in the Rhineland. After Hitler's advent to power in 1933, Goebbels received the newly-created post of reich minister of propaganda and public enlightenment. He was phenomenally successful in indoctrinating the entire nation with Hitler's ideas. The German press, radio and every other possible outlet for public information were under his strict control. After the period of great victories in World War II had ended and that of great defeats had started, Goebbels employed the channels of public information to prop sagging German morale. During 1944, he repeatedly promised the German people that "new and marvelous" secret weapons would snatch Germany from the abyss of certain defeat and result in ultimate triumph. He alternated these glowing promises with dire warnings that complete ruin and destruction faced the reich if it failed to emerge victorious. In early 1945, Goebbels' propaganda became more strident in its hysterical appeal to the people of Germany to stand firm. On April 19, he exhorted the Germans to disregard the rules of international warfare. "All means are fair and permissible in the struggle against the terrible foe," he cried. On April 24, he appealed to the citizenry of Berlin to "hold out" until "reinforcements" arrived from other fronts to defend the capital. Goebbels was believed to have remained in the reich chancellery with Hitler during the paroxysmic "last stand" in Berlin. A soviet communique of May 3, quoting a deposition by Hans Fritzsche, an assistant of Goebbels who was captured by the Russians, said that Goebbels had committed suicide. See also *Encyclopædia Britannica*.

**Goering, Hermann Wilhelm** (1893- ), German reichsmarshal and statesman, was born at Rosenheim, Bavaria, on Jan. 12 and was commander of the famed Richthofen squadron in the German air

force during World War I after Richthofen's death. Goering was an early member of the nazi party and became air minister and minister of the interior in 1933 upon Hitler's accession to the chancellorship. (See *Encyclopædia Britannica*.) On July 19, 1940, Hitler conferred the newly created title of marshal of the reich on Goering. As head of the economics general staff, Goering had supreme control over Germany's economic life. He was generally regarded as second man in Germany during World War II. His prediction in 1941 that the luftwaffe could do 100 to 1,000 times more damage than the R.A.F. was a sorry one, but his position as leader remained intact. In July 1944 he was named mobilization dictator. Goering surrendered to the Allies on May 9, 1945, and was indicted as a war criminal by the United Nations War Crimes commission, May 12. The political will of Adolf Hitler (dated April 29, 1945), disclosed that the fuhrer had ousted Goering from all of his government and party posts for "disloyalty." The prosecutors at the Nuernberg war crimes trial, at which Goering was one of the defendants, charged that the reichsmarshal was one of the chief instigators of the nazi plan to build a greater Germany by ruthless aggression and said he was implicated in the mass murders of Jews and foreign slave labourers. The trial was continuing at the end of 1945.

**Gold.** The two major trends with respect to gold introduced with World War II were still clearly in evidence in 1945. These were: (1) the decline in world output, and (2) the reversal of the prewar flow of gold into the United States, which between 1934 and 1941 had drawn \$18,700,000,000 of

Table I.—Analysis of Changes in Gold Stock of the United States

\*Figures based on rate of \$20.67 a fine ounce in Jan. 1934, and \$35 a fine ounce thereafter.

†Includes gold in the inactive account.

‡Gold under earmark at Federal Reserve banks for foreign account amounted to \$4,294,000,000 on Dec. 31, 1945. Of this \$4,191,000,000 was for foreign account.

§Preliminary.

||Not available.

GOLD PRODUCTION: world total and output of the principal producing countries, as compiled by *The Mineral Industry*

that metal from the rest of the world.

The decline in U.S. gold stocks and the building up of reserves elsewhere had resulted by mid-1945 in raising non-U.S. holdings to more than \$13,000,000,000, according to estimates of the New York Federal Reserve bank. Many important nations were publishing only incomplete reports, or none.

While the rest of the world, taken as a whole, was increasing its gold reserves in 1945, stocks of the U.S. fell from \$20,619,000,000 in 1944 to \$20,065,000,000, a decline of \$554,000,000. The cumulative loss for the three years ended Dec. 31, 1945, was \$2,669,000,000, of which \$2,077,000,000 represented earmarking and \$586,000,000 net physical exports.

(See also FEDERAL RESERVE SYSTEM.) (E. H. Co.)

World Production.—War conditions in 1945 made data on gold production inaccessible from most of Europe and Asia and part of Africa and Oceania. The available figures for important producing countries are as follows.

Table II.—World Production of Gold

	(Thousands of fine ounces)				
	1940	1941	1942	1943	1944
United States . . . . .	4,863	4,832	3,583	1,381	1,022
Canada . . . . .	5,311	5,345	4,841	3,651	2,885
Mexico . . . . .	883	800	801	632	509
South America . . . . .	1,880	1,747	1,604	1,442	1,368
India . . . . .	289	286	260	252	228
Belgian Congo . . . . .	555	561	500	453	?
Gold Coast . . . . .	886	885	784	565	?
Southern Rhodesia . . . . .	826	790	760	657	593
South Africa . . . . .	14,097	14,407	14,121	12,800	12,277
Australia . . . . .	1,644	1,497	1,154	751	658
Total (est.) . . . . .	42,153	40,291	35,514	29,429	27,070

The Union of Soviet Socialist Republics, which turns out the bulk of the European total, ceased reporting output several years before World War II. Three-quarters of the Asiatic prewar total came from Japanese territory and the Philippines. Even with data lacking from these and other areas of lesser importance, the figures reflect the widespread decline in gold output during the war years. In many countries this reduction was intentional, in order to concentrate labour and material on the production of more essential metals, but in some countries not involved in the war to any major degree, production was hampered by lack of proper equipment and supplies. A comparison of World Wars I and II shows that in both 1915 and 1940 gold production was higher than in the preceding year, but 1944 dropped 36% below 1940 and 23% below 1939, while 1918 was only 18% less than 1915 and 13% less than 1914.

The following figures were reported for output in 1945: U.S. (ten months) 750,000 oz.; Canada (nine months) 1,961,196 oz.; Colombia (nine months) 402,000 oz.; India (nine months) 141,000 oz.; South Africa (ten months) 10,188,000 oz.; Southern Rhodesia (eight months) 382,000 oz.; Gold Coast (ten months) 455,000 oz.

United States.—The restriction of gold production continued in the U.S. in 1944, with the total reaching the lowest figure after the gold rush to California in 1849. There was little production from mines working primarily for gold, and when the peak of demand for base metals was past, gold recovery from these sources also declined. Losses averaged 27% below the 1943 level, and were well distributed over all producing areas. The total decline in output in the U.S. was 79%, as compared with 36% for the world total. (See also EXCHANGE CONTROL AND EXCHANGE RATES; MINERAL AND METAL PRODUCTION AND PRICES.) (G. A. Ro.)

**Gold Coast:** see BRITISH WEST AFRICA.

**Golf.** The story of golf in the U.S. in 1945 was pretty largely the story of one man and one golf organization. The man was Byron (Lord) Nelson and the organization the Professional Golfers' association to which he, being a professional, belonged.

Nelson, 33-year-old Texan, gained a mastery over his clubs no other player ever attained and, competing in 31 of the 40-odd tournaments arranged by the P.G.A. tournament bureau, won first money in 19 of them.

When the year ended his prize winnings had reached the fantastic total of \$60,600 in war bonds, breaking all previous records. The former high-water mark was \$46,766 which he set in 1944 when he more than doubled the existing mark of \$19,554 made by Sam Snead in 1938.

Nelson's chief triumph came in the P.G.A. championship which he won for a second time by defeating Sam Byrd, one-time New York Yankee outfielder, 4 and 3. The event was played at the Moraine Country club, Dayton, O., and Nelson had to come from behind after being three down at the end of 21 holes.

BING CROSBY (left) and Bob Hope playing an exhibition match at the Tam O'Shanter Country club, Chicago, during the summer of 1945. Proceeds went to the P.G.A. fund for rehabilitation of servicemen

The 1944 winner, Bob Hamilton, competing while on furlough from Ft. Lewis, Wash., was eliminated by Jack Grout of Chicago, Ill., in the opening round. The year 1945 marked the fifth time Nelson had been in the finals after 1939.

In addition he annexed the Canadian open, revived after a two-year blackout, with a total of 280, and also annexed the All-American open at Tam O'Shanter (Chicago) for the fourth time in five years with a score of 269, 19 under par. First prize in the All-American was \$13,200 in bonds, one of the largest sums ever realized by a single player in any one tournament. It raised his over-all collections in the All-American, which he had won in 1941, 1942 and 1944, to \$26,975 in actual cash.

In the course of the greatest winning streak ever attained by any player in the game's history, Nelson won 11 successive tournaments before being finally checked by Fred Haas, Jr., New Orleans amateur, in the Memphis, Tenn., open. Haas, incidentally, was the first amateur to turn back the pros in a P.G.A. event after Kenny Black last turned the trick in the Vancouver, Wash., open in 1936.

Subsequently two other amateurs outdid the pros in the field in which they are supposed to be unbeatable. Lt. Cary Middlecoff of Memphis carried off the honours in Pinehurst's centennial event while Frank Stranahan of Toledo, O., repeated the performance at Durham, N.C.

Harold (Jug) McSpaden, although failing to win a single tournament during the year, finished second in enough of them to wind up as the second-high money winner, his total earnings amounting to \$34,200.

During the year Nelson also established a new P.G.A. scoring record when he won the Seattle, Wash., open with the breath-taking score of 259, his four rounds being 62, 68, 63, 66. That left him 21 under par for a new world's record for a par 70 course.

Only a short while before Ben Hogan, who returned to tournament play after serving three years in the air force, won the Portland, Ore., open with a score of 261, his rounds being 65,

69, 63, 64. In a way this even bettered Nelson's score at Seattle for it was made on a par 72 course and was 27 strokes below par. Another record fell to Nelson's prowess when his year's average turned out to be 68.33, almost a full stroke below the mark he had set in 1944.

At the end of the year Nelson was honoured by being voted the year's No. 1 athlete in the annual Associated Press poll. This was the second successive time he had received the honour and marked the second time in the poll's history any athlete had been twice awarded the distinction. Don Budge, tennis star, received the award in 1937 and 1938. Only one other golfer was ever honoured in the poll, Gene Sarazen being the first choice of the voters in 1932. The tournaments Nelson won in 1945 together with his scores follow:

Phoenix (Ariz.) open, 274; Corpus Christi (Tex.) open, 264; New Orleans (La.) open (in play-off with Harold (Jug) McSpaden after tie at 284); Miami (Fla.) 4-ball (with McSpaden as partner); Charlotte (N.C.) open (in play-off with Sam Snead after ties at 272 and 69); Durham (N.C.) open, 276; Atlanta (Ga.) open, 263; Montreal (Canada) open, 268; Philadelphia Inquirer Invitation open, 269; Chicago Victory open, 275; P.G.A. championship; All-American open, 269; Canadian open, 280; Knoxville (Tenn.) open, 276; Spokane (Wash.) open, 266; Seattle (Wash.) open, 259; Fort Worth (Tex.) open, 273.

Other P.G.A. tournament winners and their scores in 1945 were:

Los Angeles (Calif.) open, Sam Snead, 283; Tucson (Ariz.) open, Ray Mangrum, 268; Texas open, Sam Byrd, 268; Gulfport (Miss.) open. Snead (in play-off with Nelson after tie at 275 and 71); Pensacola (Fla.) open, Snead, 266; Jacksonville (Fla.) open, Snead, 266; St. Paul (Minn.) open, E. J. Harrison, 273; Memphis (Tenn.) open, amateur Fred Haas, Jr., 270; Nashville (Tenn.) open, Ben Hogan, 265; Dallas (Tex.) open, Snead, 276; Tulsa (Okla.) open, Snead, 277; Portland (Ore.) open, Hogan, 261; Tacoma (Wash.) open, Jimmy Hines, 275; Richmond (Va.) open, Hogan, 289; Pinehurst (N.C.) open, amateur Lt. Cary Middlecoff, 280; Durham (N.C.) open, amateur Frank Stranahan, 277; Mobile (Ala.) open, Sam Byrd (in play-off with E. J. Harrison after tie at 283); Montgomery (Ala.) open, Hogan (in play-off with Harold McSpaden after tie at 282); Orlando (Fla.) open, Hogan, 270; Miami (Fla.) open, Henry Picard, 267. (W. D. R.)

**Gonorrhoea:** see VENEREAL DISEASES.

**Göring, Hermann Wilhelm:** see GOERING, HERMANN WILHELM.

**Gorizia:** see TRIESTE; YUGOSLAVIA.

**Gouveia, Teodosio Clemente de** (1889- ), cardinal archbishop of Lourenço Marques, Portuguese East Africa, was born at São Jorge, Madeira, on May 13. He was ordained in 1919; elevated to bishop of titular see of Leuce in 1936; and named archbishop of Lourenço Marques in 1941.

To secure funds for a new cathedral in the archdiocese, his excellency sold all the historical plate in the episcopal residence, accumulated down through the centuries. He was host to His Eminence Emmanuel Cardinal Gonçalves Cerêfeira, patriarch of Lisbon and 12 apostolic delegates at impressive consecration ceremonies of the cathedral in 1945. He has travelled throughout the entire vast archdiocese on foot, by plane and by automobile. He was named by Pope Pius XII to the Sacred College of Cardinals according to an announcement of Dec. 23, 1945, and was created and proclaimed a cardinal Feb. 18, 1946.

## Government Departments and Bureaus.

The following are the leading officers of the more important government departments and bureaus of the United States. The date for the information is Dec. 31, 1945.

Department or Bureau	Name	Post
Department of State . . . . .	*Byrnes, James F. *Acheson, Dean Cohen, Benjamin V. *Benton, William Clayton, William L. Dunn, James C. Braden, Spruille Russell, Donald S.	Secretary Under-Sec'y Counselor Asst. Sec'y Asst. Sec'y Asst. Sec'y Asst. Sec'y Asst. Sec'y
Office of International Information and Cultural Affairs . . . . .	Stone, William T.	Director
Department of the Treasury . . . . .	*Vinson, Fred M. Bell, Daniel W.	Secretary Under-Sec'y

Department or Bureau	Name	Post
Bureau of Comptroller of Currency . . . . .	Delano, Preston	Comptroller
Treasurer of the U.S. . . . .	Julian, William A.	Treasurer
Bureau of Customs . . . . .	Johnston, W. R.	Commissioner

**Grant, Heber J.** (1856–1945), U.S. cleric and head of the Latter Day Saints (Mormon) Church, was born Nov. 22 in Salt Lake City, Utah, the son of one of the earliest Mormon settlers, who became the first mayor of Salt Lake City (incorporated) in 1851. Heber Grant studied at Deseret (later Utah) university and joined the Latter Day

Saints in 1876. Six years later, 1882, he was elected a member of the Council of Twelve and an apostle. He was named president of the council in 1916 and on Nov. 23, 1918, he was elected to the first-presidency of the Mormon Church. At one time Grant had three wives, but after the church barred polygamy he gave vigorous endorsement to the institution of monogamy; he also frowned upon Mormons who drank alcohol, tea or coffee, or used tobacco, and disapproved of "immodest" dress for Mormon women. He travelled throughout Europe and also in Japan, where he supervised the work of the Mormon missions. In his home state, he was active in business and was president of a number of influential and prosperous Utah firms. He died in Salt Lake City, May 14.

**Grapefruit:** see FRUIT.

**Grapes:** see FRUIT.

**Graphite.** Production of graphite in the United States increased from 7,120 short tons in 1942 to 9,939 tons in 1943, but dropped back to 5,408 tons in 1944. Corresponding shipments were 7,253 tons, 9,597 tons and 5,768 tons. By the end of 1943 the foreign supply had improved to such an extent that the plants erected with government funds were shut down, and War Production board restrictions on the use of graphite were relaxed. There seemed to be little prospect for a substantial postwar industry, since production costs were higher, while quality was lower than Ceylon and Madagascar graphite.

In Ceylon production declined in 1944 as a result of lower prices and many small mines were closed. Exports decreased, but shipments to the United States increased. All trade was controlled by the British ministry of supply until March 31, 1945, when the industry was turned back to private control.

Canada produced 1,903 short tons in 1943 and 1,582 tons in 1944, mainly of foundry grades. (G. A. Ro.)

**Gravel:** see SAND AND GRAVEL.

## Great Britain & Northern Ireland,

**United Kingdom of.** This comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts, and the six northeastern counties of Ireland. It is a constitutional monarchy, with a king and a parliament of two houses: the house of lords consisting of about 670 hereditary peers, 24 spiritual peers, 16 Scottish representative peers, a number of Irish representative peers (in 1944, 12; vacancies are no longer filled) and a few life peers who have held high judicial office; and the house of commons, numbering 640 members, elected by a practically universal suffrage. Flag, the Union Jack, consisting of a red cross on a white field (for England), surcharged on a diagonal white field (for Ireland), surcharged in turn on a diagonal white cross on a blue field (for Scotland). Ruler: King George VI (*q.v.*); prime minister: Clement R. Attlee, (*q.v.*); established church: Protestant Episcopal.

**Area and Population.**—Area 93,991 sq.mi.; pop. (est. Dec. 31, 1939) 47,735,000 (England and Wales 41,417,000). Chief towns (pop. est. June 30, 1938): London (cap.), city and metropolitan police districts, 8,700,000; city and metropolitan boroughs only, 4,062,800; Glasgow (June 30, 1939), 1,131,500; Birmingham, 1,041,000; Manchester (including Salford), 932,300; Liverpool, 827,400; Sheffield, 520,000; Leeds, 494,000; Edinburgh (June 30, 1939), 473,200; Belfast (Jan. 1, 1939), 443,500; Bristol, 415,000; Hull, 318,700.

**History.**—The principal events of 1945 were concentrated in the four middle months. The war in Europe ended on May 8

and a fortnight later the coalition of parties which had governed the United Kingdom from May 1940 under the premiership of Winston Churchill was dissolved. Churchill thereupon formed a "caretaker government" pending the dissolution of parliament and a general election. The dissolution took place on June 15 and the election on July 5. The returns which were made on July 26 gave the Labour party a majority of 158 over all other parties, and Attlee became prime minister. On Aug. 14 the Japanese surrendered. On Aug. 20 Pres. Truman cancelled all outstanding contracts for lend-lease.

The discovery of the means of releasing atomic energy aroused intense speculative interest. The government appointed a committee with Sir John Anderson as chairman to report on the subject and as a result the establishment of a research experimental station to cost £50,000,000 was announced. On Nov. 9 Attlee and Sir John Anderson left for the U.S. for a conference with Pres. Truman, and a joint statement issued by them on Nov. 15 regarding trusteeship of atom power was received with general approval.

**The General Election.**—The result of the election was a surprise even to the victors. No one expected so strong a swing to the left. The great receptions Churchill received during his election tours seemed to presage a different result. The extent of the turnover of votes is shown in the following comparison between the results in 1935, the date of the last previous general election, and 1945:

Year	Conservative, Liberal National, National and Ulster Union		Labour		Liberal		Others	
	Votes	Seats	Votes	Seats	Votes	Seats	Votes	Seats
1935	11,792,332	431	8,325,260	154	1,443,112	21	481,671	9
1945	9,960,809	213	11,992,292	393	2,239,668	12	491,162	22

At the time of the dissolution the Labour party held 163 seats. Its representation was therefore enlarged by 141% although the number of votes cast for it was only 32% more than in 1935. Its success was particularly noticeable in boroughs where formerly it had secured but moderate support. London returned 49 Labour members out of 62 constituencies, compared with 22 in 1935. The party even captured some county and rural seats in East Anglia, Buckinghamshire, Middlesex, Hampshire and in the west. These results were in some degree attributable to transfers of industrial workers and town dwellers into rural areas through the war. The party received much support from the forces and, for the first time, from the non-party floating mass of the electors who might have been expected to vote for Churchill. The Conservatives, together with the National Liberal and National Labour parties, held 393 seats at the dissolution. Of these they lost 181 or 46%, although their total of votes was only 15.5% below that of 1935. This fact, however, in no way reduced the significance of the Labour victory. The Liberals also did much worse than was expected. At the dissolution they held 18 seats and confidently anticipated adding considerably to them.

**Foreign Policy.**—The advent of the new government resulted in no appreciable change in British foreign policy. Attlee in September declared that a good understanding between Britain, the U.S.A. and the U.S.S.R. was the keystone of the arch of world security, and that the grave problems of Europe, of the middle and the far east were not soluble by short cuts or hasty actions. A change of heart was needed and a recognition of the economic interdependence of all peoples. His first requisite, a good understanding between the three great powers, received a serious setback when the council of their three foreign ministers with those of France and China broke up in disagreement on Oct. 2 on the question whether France and China, which had not signed the terms of sur-

THE ANCIENT Tower of London on the Thames was radiant under floodlight during the V-E celebrations in May 1945. Londoners welcomed an end to six years of darkness and war

render with Rumania, Bulgaria, Hungary and Finland, should be admitted to participate in discussing the contents of the peace treaties with them. V. M. Molotov upheld that they were excluded by the Berlin agreement of July 1945 setting up the council. Ernest Bevin maintained that not to admit them was incompatible with the charter of the United Nations.

*The Budget.*—When the regular annual budget for 1945-46 was introduced in April the total expenditure of the country on the war had amounted to £27,400,000,000 of which sum 49% had been paid out of current revenue. Of actual war expenditure 53.3% had been met by taxation, and the amount made available to the government in taxes and savings had been 42% of the total personal income of the country. The deficit, together with debt repayments and other capital transactions, had been covered as to 22% by small savings, 33% by the sale of other loans to the public, 31% by floating debt, and 14% from other sources. The war expenditure for 1944-45 was £4,678,000,000 and was paid as to 22% by reductions in consumption, 44½% from increased production, 7% from reduction in nonwar public expenditure, 14½% from reduced provisions for domestic capital and 12% from drafts on overseas capital. Thus more than a quarter of the cost of the war in 1944-45 was met at the expense of the national capital. The proportion for the five-and-a-half years was more than one-third. The expenditure for 1945-46 was estimated at £5,565,000,000 and the revenue at £3,265,000,000. These estimates were afterwards confirmed by Hugh Dalton in his supplementary budget of October. But the circumstance of the war being ended enabled him to announce some remissions of income tax which would come into effect in 1946-47 and in a full year amount to £315,000,000. In 1944-45, £1,183,000,000 were collected in income tax of which £540,000,000 were paid by the 12,000,000 people coming under the pay-as-you-earn system. Dalton's proposal relieved 2,000,000 of these of all liability, raised the exemption limit from £110 to £120, restored the personal allowance for married couples from £140 to the prewar £180 and for a single person from £80 to £110, and reduced the standard rate of tax from 10s. to 9s. But these reductions were balanced as to £7,000,000 by certain increases in surtax on higher incomes.

*International Financial Position.*—In 1929 the United King-

dom had overseas assets worth about £4,000,000,000. At least half of them were drawn upon during the war. In addition, sterling balances totalling more than £4,000,000,000 had accumulated in London to the credit of overseas countries. Hence Britain's international financial position had deteriorated during the war by not less than £6,000,000,000. The nature of Britain's contributions to the war was one cause of this result. They were mainly of the kinds which do not enter into international accountancy. On the other hand the assistance Britain required was of a kind which does. Moreover the figures omit any reference to the contingent liability of between £4,000,000,000 and £5,000,000,000 under lend-lease. After lend-lease was stopped on Aug. 20, Attlee announced that, excluding munitions, the overseas outgoings received under it up to the surrender of Japan were equivalent to an expenditure of £2,000,000,000 a year, toward which exports of £350,000,000 and other sources of income, some nonrecurring, might contribute £800,000,000. Britain therefore would have to start re-establishing its economy with an initial deficit of £1,200,000,000. Thus the war, by transforming Britain's international financial position, had emphasized the paramount importance to it of exports, not only to pay for essential imports, but also to meet new overseas liabilities arising from its war effort. At the same time the war cut down its exports from £470,000,000 in 1938 to £257,000,000 in 1944 and also reduced its merchant shipping from 40,000,000 dead-weight tons to 19,500,000. In the second place the war had imposed on Britain the necessity to prune down imports and other external expenditures. The British consumer would have to be satisfied with fewer imported goods and at the same time agree to surrender more of the domestic products to the export market.

*Demobilization.*—The capacity to reduce overseas expenditure and to stimulate exports depended upon the speed of reconversion from war to peace. Of the country's total labour strength, 55% was utilized in the forces and in war production. On the military side 5,350,000 men and women were involved. Their demobilization was governed by three factors: (1) the country's unavoidable military commitments at home and overseas—the cost of maintaining forces overseas adding greatly to external expenditure. In October 2,160,000 men were still serving overseas. (2) Transportation. (3) The Bevin scheme. This last was prepared while Bevin was minister of labour and national service. It was founded on the assumption that the war with Japan would continue for 18 months after the surrender of

Germany and on the principle that age and length of service should settle the order of release. Under a class A all serving had been arranged in groups according to their ages and the length of their service. But in order to meet the cases of men whose earlier release was needed for essential industries (such as building, civil engineering and underground coal mining) and essential services (such as teaching) a class B had been formed whose members were released before their class A time on condition that they remained for an indefinite time in these employments. Furthermore, class B releases must not exceed 10% of class A. On the assumption of a continuing Japanese war a release of 750,000 men and women by the end of 1945 was anticipated. With the sudden end of the Japanese war military commitments had to be entirely revised before any accelerated rate of release could be decided. Moreover the chief limiting factor then became, not military commitments, but shipping and transport. Another complication was the wide dispersal of class A groups which made it unfair to discharge men who happened to be in England before others in the same group who were abroad could be brought home. In these circumstances the revised estimates of demobilization were summarized as follows:

	Men	Women	Total
June to December 1945	1,347,800	162,270	1,510,070
January to June 1946	1,446,300	159,480	1,605,780
	2,794,100	321,750	3,115,850

The numbers still in the forces at the end of June 1946 would then be:

	Men	Women	Total
Navy	400,000	15,000	415,000
Army	1,109,900	47,000	1,156,900
Air Force	584,200	68,000	652,200
Nursing Service	—	8,700	8,700
	2,094,100	138,700	2,232,800

**Reorganization of Industry.**—The government decided in the autumn to buy out the shareholders of the Bank of England and to nationalize the coal mining industry, cable and wireless communications and civil aviation. Meanwhile Emanuel Shinwell was agitating to increase the output of coal by 8,000,000 tons during the winter of 1945-46. Sir Stafford Cripps appointed five "working parties," each composed of four employers, four trade unionists, four independent persons and an independent chairman, to examine and report on schemes and suggestions to improve the efficiency of the cotton, pottery, furniture, hosiery and boot and shoe industries. Each party was required to report before Christmas. Other industries were to be subjected to the same process later.

**Housing.**—The coalition government estimated that 300,000 was the largest number of brick houses which could be built during the two years after the defeat of Germany. This would go but a small way toward meeting the accumulated demand arising from a prewar shortage, the cessation of building during the war, the complete destruction of 200,000 houses by enemy action and the reparable damage done to others, in London alone numbering 720,000. Moreover about 4,000,000 houses were more than 80 years old and needed reconditioning. Aneurin Bevan, speaking for the Labour government, refused to commit himself to any estimate of future output owing to the uncertainties of cost and of labour supply. Instead, a monthly progress report was to be issued. Prefabricated houses would help to the extent of 158,480; but the chief responsibility would rest on the local authorities whose powers had been enlarged to meet the emergency.

**Controls.**—When introducing the bill to buy out the shareholders of the Bank of England, Dalton defended it for two reasons: (1) it would bring the law into relation with the fact

that the bank's policy had for many years conformed to that of the treasury; (2) it would ensure the country's banking and financial system conforming with the government's five-year plan and meeting the needs of its investment policy. The opposition was chiefly aimed against clause 4 empowering the bank, if authorized by the treasury, to secure information from, or to issue directions to, the commercial banks. The Supplies and Services (Emergency) bill enabling the government to maintain certain war controls for five years also drew some criticism. The need for such a measure during the transition period from war to peace was recognized by the coalition government. But two years were then considered to suffice, and the Labour government's lengthening of the time to five years aroused the suspicions of the opposition. But the bill passed.

**Cost of Living.**—Subsidies to keep down the cost of living were running at the rate of £70,000,000 in 1940 and £225,000,000 in 1945. Through their means the cost of living in Oct. 1945 was no more than 30½% above prewar level. The government intended to stabilize it at this level at an expenditure of £300,000,000. During the war the general level of wages rose 46% above the prewar level, but average earnings were as high as 82% above it. The latter rise had later fallen owing to the reduction of overtime, and the consequent loss of earning power was a cause of industrial unrest. Nevertheless the government had not suggested imposing any wages ceiling, equivalent to the cost of living ceiling. Dalton in his budget speech was content to rely on the continuing co-operation of the government and the trade unions, both recognizing their common interest in keeping prices and wages on an even keel. The dock strike was a warning that this reliance might not be sufficient.

**Dock Strike.**—Some industrial unrest was to be expected after the war and the dock strike was the outstanding example. Beginning in August over the rates of pay for unloading pit props, it spread to nearly all ports and by the end of September more than 40,000 men were out, although unsupported by the Transport and General Workers' union. Hence the strike was unofficial and was condemned by the government. Soldiers were drafted into the ports to handle cargoes, but even so delays occurred in the turn-round of ships, interfering with the imports of food and with demobilization. The strike ended on Nov. 5; the men returning to work unconditionally and negotiations on their terms of employment were opened at once. (H. A. Wn.)

**Education.**—In 1937-38: elementary, England and Wales—departments under separate head teachers, 29,988, scholars on register 5,150,874; elementary, Scotland—schools 2,895, scholars 617,047; elementary, Northern Ireland—schools 1,700, scholars 191,862; secondary, England and Wales—grant-aided schools 1,398, scholars 470,003; secondary, Scotland—grant-aided schools 252, scholars 156,645; secondary, Northern Ireland—grant-aided schools 75, scholars 14,557; universities, students: England 41,707 (full-time, 36,378); Wales 3,089 (full-time 2,970); Scotland, 10,384 (full-time, 9,841); Northern Ireland, 1,590 full-time students.

**Banking and Finance.**—Revenue, ordinary (est. 1945-46) \$13,160,000,000. Expenditure, ordinary (est. 1945-46) \$22,350,000,000. Revenue, ordinary (actual 1944-45) \$13,030,000,000. Expenditure, ordinary (actual 1944-45) \$24,450,000,000. Notes in circulation (July 27, 1945) \$5,190,000,000. Public debt (national) March 31, 1945, \$90,100,000,000. Exchange rate 1944, £1=403.5 cents U.S. (See Table III.)

**Trade and Communication.**—Roads (March 31, 1938): England and Wales (class I) 20,627 mi.; (class II) 13,070 mi.; Scotland (class I) 6,632 mi.; (class II) 3,967 mi.; Northern Ireland (class I) 1,273 mi.; (class II) 1,933 mi. Railways (Dec. 31, 1938): Great Britain, track open to traffic, excluding sidings, 20,007 mi.; Northern Ireland, standard gauge, 633 mi.; narrow

THE NEW BRITISH LABOUR cabinet formed after the general elections of July 1945. Left to right, bottom row: Viscount Addison; Lord Jowitt; Sir Stafford Cripps; Arthur Greenwood; Ernest Bevin; C. R. Attlee, the prime minister; Herbert Morrison; Hugh Dalton; A. V. Alexander; J. Chuter Ede; Ellen Wilkinson. Middle row: Sir Ben Smith; John Wilmot; Aneurin Bevan; G. A. Isaacs; Viscount Stansgate; G. H. Hall; Lord Pethwick-Lawrence; J. J. Lawson; J. Westwood; Emanuel Shinwell; T. Williams; Sir Alfred Barnes; G. Tomlinson. Top row: William Whiteley; Sir Edward Bridges; F. Soskice; J. B. Hynd; Lord Listowel; E. J. Williams; Lewis Silkin; James Griffiths; Lord Winster; P. J. Noel-Baker; Wilfred Paling; Sir Hartley Shawcross; Norman Brook

Table III.—Estimated Revenue and Expenditure 1945-1946

ESTIMATED REVENUE 1945-46		
Income Tax	\$ 5,430,000,000	\$
Surtax	322,000,000	
Estate Duties	463,000,000	
Stamps	76,600,000	
National Defense Contribution and Excess Profits Tax	2,018,000,000	
Other Inland Revenue Duties	4,035,000	
Total Inland Revenue		8,313,635,000
Customs	2,370,000,000	
Excise	2,180,000,000	
Total Customs and Excise		4,550,000,000
Motor Vehicle Duties		121,000,000
Crown Lands		4,035,000
Wireless Licences		19,350,000
Receipts from Sundry Loans		45,100,000
Miscellaneous		92,800,000
Total Ordinary Revenue		\$13,145,920,000
ESTIMATED EXPENDITURE 1945-46		
Interest and Management of National Debt		\$ 1,872,000,000
Miscellaneous Consolidated Fund Services		76,600,000
Total		1,948,600,000
Supply Services		
Civil		
Central Government and Finance		18,760,000
Foreign and Imperial		117,300,000
Home Department, Law and Justice		87,400,000
Education and Broadcasting		418,000,000
Health, Labour, Insurance (inc. Old Age and Widows' Pensions)		938,000,000
Trade, Industry and Transport		114,200,000
Works, Stationery, etc.		104,100,000
War Pensions 1914-18, and Civil Pensions		167,700,000
Exchequer Contributions to Local Revenues		212,400,000
War Services (token votes)		2,177,860,000
Votes of Credit		18,120,000,000*
Tax Collection—Customs and Excise and Inland Revenue votes (inc. Pensions)		85,300,000
Total Ordinary Expenditure		\$20,383,200,000
		\$22,350,000,000

\*Excluding value of supplies in kind under lend-lease and similar arrangements.

**Industry and Labour.**—Index of industrial production (1929=100) av. (1938) 115.5; av. (Jan.–June 1939) 123.1; index of employment (1929=100) av. (1939) 113.0. Occupied population (including armed forces) (July 1944) 21,956,000; unemployed, wholly (July 1944) 102,000. (See also BUSINESS REVIEW; WORLD WAR II.)

**Great Lakes Traffic:** see CANALS AND INLAND WATERWAYS.

**Greece.** A kingdom in the southern part of the Balkan peninsula. Area, 50,147 sq.mi., of which 41,328 are mainland. Pop. (census May 16, 1928), 6,204,684, (est. 1940) 7,150,000. Capital, Athens (392,781). Chief cities: Thessaloniki or Salonika (236,524), Patras (61,278), Cavalla (49,980), Candia (33,404), Corfu (32,221). Religion: mostly Greek Orthodox; inconsiderable Mohammedan and Jewish minorities. King: George II. Regent: Archbishop Damaskinos. Prime Minister (1945): Themistocles Sophoulis.

**History.**—In 1945 the violent civil war which had torn Greece at the end of 1944 subsided. It had been the outcome of deep-rooted dissensions which had led Greece repeatedly during its modern history to the brink of, or through the turmoil of, civil war. The situation had been aggravated by the sufferings of World War II which probably hit Greece more than most other occupied or belligerent nations. As the result of German and Italian occupation Greece was starved and its economic life entirely disorganized. Having lived from 1936 under a fascist regime, Greece was accustomed to the lawlessness of such a regime and of the underground struggle against totalitarianism. With political violence a feature of Greek history from the "war of liberation" in the 1820s, the liberation of Greece from enemy occupation in 1944 ended in a violent civil war.

The resistance movement organized in the National Liberation Front (E.A.M. or Ethnikon Apeletherotikon Metopon) and its armed forces, the Greek Popular Liberation army (E.L.A.S. or Ellenikos Laikos Apeletherotikos Stratos) tried to seize power. It was largely under communist inspiration and leadership. The attempt was frustrated by the Greek government troops and the British army which had come to Greece on behalf of the United Nations in the prosecution of the war against Germany. There was a widespread fear that Britain favoured the continuation of the monarchy in Greece. Official British spokesmen denied that intention. King George II, who had left Greece together with remnants of the Greek army, after the Greek resistance to the advancing German troops had broken down, declared that he would make his return dependent upon the outcome of a free plebiscite. Archbishop Damaskinos of Athens, a well-known patriot, was appointed regent of Greece, and General Nicholas Plastiras, the leader of the Republican revolution of 1922, became prime minister Jan. 2, 1945. The plebiscite was to be held as soon as possible.

Peace between the government and the revolutionaries was concluded on Feb. 12. The peace negotiations were conducted on behalf of the government by John Sofianopoulos, the minister of foreign affairs, Pericles Rhallis, the minister of the interior, and John Macropoulos, minister of agriculture; on the part of the E.A.M. by George Siantos and Dimitrius Partsalides, the leaders of the Greek Communist party, and Elias Tsimirikos, a Socialist, with General Stephen Saraphis as military advisor. Winston Churchill and Anthony Eden arrived in Athens for a brief visit on Feb. 14. Martial law was ended, and civil liberties were fast restored. By the end of 1945 Greece was the only country in southeastern and eastern Europe where complete liberty of the press existed and full freedom was given to the expression of oppositional viewpoints. This

restoration of democracy was one of the favourable achievements of the troubled period in Europe after World War II.

The most serious problem facing Greece after the establishment of peace and the introduction of democratic liberties was the restoration of its economic life. Under the influence of the violence committed during the civil war the large majority of the Greek population demanded above all a peaceful consolidation. The swing to the right in the popular feeling increased the chances for the return of the king. Though the Greeks are by no means attached to the monarchy, they regarded the king as the best guarantee of stability against revolutionary attempts with their lamentable excesses. The government of Admiral Petros Voulgaris which took office in April was, however, unable to cope with the severity of the economic crisis. It resigned at the beginning of October, and after a brief interim during which Regent Damaskinos himself took over the cabinet, Professor Panayoti Kanellopoulos formed a ministry in which Finance Minister Gregory Kassimatis tried to grapple with the terrific inflation and the rapidly soaring prices and to restore confidence in the economic rehabilitation of the country. Greece hoped for reparations from Germany, Italy and Bulgaria, the armies of which had devastated and plundered the country. But to the end of the year 1945 Greece was unable to obtain any relief through reparations, though machinery and especially shipping were badly needed. The Greek merchant fleet, one of the largest in the world, had been almost completely destroyed. When the Germans and Bulgarians retreated from Greece in the fall of 1944, they took all available railway and rolling stock with them. Bulgaria could have mitigated starvation in Greece by supplying much needed livestock and foodstuffs. The only bright point in the situation was the help from the United Nations Relief and Rehabilitation administration.

In November the British undersecretary for foreign affairs, Hector McNeil, visited Greece. On Nov. 21 a new government was formed under the Liberal leader Themistocles Sophoulis. The new cabinet declared that it would defer until 1948 the plebiscite on the return of King George II to Greece. This measure aroused strong opposition from the Populist party who were adherents of the monarchy. Their leader, Constantine Tsaldaris, demanded that the original plan of a free plebiscite in the spring of 1946 be adhered to. He was confident that a democratic and free plebiscite would go overwhelmingly in favour of the king. Foreign observers confirmed this expectation. King George II protested also against the postponement of the plebiscite and declared that it "amounts to the stifling of the sentiment of the Greek people which, as is known to all,

GIFTS of clothing for this peasant woman of old Corinth, Greece, came, in 1945, from U.S. collections for Greek relief

is being expressed clearly in my favour at every opportunity." The Republicans and Liberals however, upheld Sophoulis. Emmanuel J. Tsouderos was made minister of economic co-ordination; George Cartalis, a member of the resistance movement, became minister of supply; and John Sofianopoulos was made foreign minister. He was the leader of the Union of the Left, was chairman of the conference which succeeded in the Varkiza agreement of Feb. 12 to end the civil war, was foreign minister in the Plastiras and Voulgaris cabinets, Greek representative at the United Nations conference in San Francisco, and was known as a friend of the soviet union. The soviet union established diplomatic relations and sent an ambassador to Athens.

Free elections in Greece were scheduled for March 31, 1946. U.S., British and French observers on the spot were to guarantee the freedom of the vote. Even the few communists still in jail would have the right to vote. By Christmas about 50,000 persons were released from jail as the result of a government amnesty to all persons accused of crimes, except murder, committed during the German occupation or the civil war. Thus by the end of 1945 Greece had reached a degree of democratic freedom which gave that country a unique position in the Balkans.

In the field of foreign policy Greece advanced territorial claims against Albania and demanded the cession of northern Epirus; against Bulgaria where frontier rectifications were demanded to give Greece greater strategic security; and against Italy which held the Dodecanese which Greece claimed. Greece, which had suffered more than any other Balkan nation, could not receive satisfaction of its territorial and financial claims in 1945 or any definite promises of their future settlement.

**Education.**—Education was compulsory for all children between the ages of 7 and 12. In 1938 Greece had 743 kindergartens with 38,338 pupils, 8,339 primary schools with 985,018 pupils and 407 high schools with 92,687 pupils. There were 3 universities with 7,230 students, an institute of technology with 521 students, and a school of fine arts.

**Industry and Trade.**—Of minerals, bauxite, nickel and chromium are found in Greece. Their production could be greatly increased. Coal and oil are not found although some lignite is produced. The country is mainly agricultural, but only one-fifth of its area is cultivable. Industry has made considerable progress, especially in textiles, agrarian industries, chemicals and metallurgy. Of special importance is the merchant marine. In 1938 there were more than 600 steamers and motor ships with almost 2,000,000 tons. Losses during World War II reduced the merchant fleet to about one-tenth.

**Finance.**—The monetary unit was the drachma, stabilized in 1928 at 77.02 to the dollar; the stabilization was suspended in April 1932. In 1940 the drachma was valued at about 0.67 cents (U.S.). For the year 1939-40 revenue was estimated at 14,014,000,000 drachmai and expenditure at 14,653,000,000 drachmai. On Dec. 3, 1938, the public debt amounted to 52,140,000,000 drachmai.

**Green, William** (1873- ), U.S. labour leader, was born March 3, in Coshocton, O. He spent much of his youth as a miner, and at the age of 27 was a subdistrict president of the United Mine Workers of America. He was international secretary-treasurer of the U.M.W.A., 1912-24, and was elected president of the American Federation of Labor, 1924. Under Green's administration, the A.F. of L. remained predominantly a crafts union. When the Committee for Industrial Organization (later known as the Congress of Industrial Organizations), a group of ten unions affiliated with the

A.F. of L., opened its campaign to establish industrial unions, Green refused to sanction the operation. This led the C.I.O., then under the guidance of John L. Lewis, to break away from the parent body in 1937. Green's A.F. of L. and the C.I.O. engaged in frequent jurisdictional squabbles and Green repeatedly denounced the Roosevelt administration for being prejudiced in favour of the C.I.O. In Jan. 1942, Green and Philip Murray (who succeeded Lewis as head of the C.I.O.) accepted Pres. Roosevelt's proposal that both unions agree to a labour peace for the duration of World War II. When the World Federation of Trade Unions conference was set up in 1945, superseding the old International Trade Union conference, Green declined (May 8) to join the organization primarily because of its inclusion of soviet trade union representatives. He denounced (Dec. 12) Pres. Truman's fact-finding bill as "involuntary servitude." He played a subdued, but watchful role during the widespread labour troubles of late 1945.

**Greenland.** The world's largest island (839,782 sq.mi., some 705,000 covered by glacier), in the North Atlantic ocean, N.W. of Iceland. A Danish possession, it came under United States protection in 1941 (*see below*). Capital, Godthaab. A population of about 18,000 (est. 1941) is scattered in small settlements on the west coast, and 1,000 on the east coast, about 600 in all being Danes, the rest native Greenlanders. Seats of the governors are Godhavn in the north and Godthaab in the south.

**History.**—Throughout World War II the local administration in Greenland remained in Danish hands. However, to prevent a German grab and to assure to the western Allies full utilization of Greenland's resources, the Danish minister in Washington, Henrik de Kauffmann, concluded with the U.S. a special agreement on April 9, 1941. According to this agreement the U.S. might build bases for planes, radio and weather stations, and maintain them by "any and all means necessary"; the agreement was to stand "until the present dangers to the American continent have passed." In line with these terms the U.S. used Greenland to great advantage. It built meteorological stations and maintained those staffs which studied weather conditions and made vital forecasts on the weather for the North Atlantic area of merchant and military importance. Repeatedly Danish patrols and the U.S. navy and coast guard sought out and destroyed German stations secretly established on the island and captured the German personnel. The agreement with Secretary of State Cordell Hull had of course been entered into on the personal responsibility of Minister de Kauffmann and was declared void by the Germans controlling Denmark in 1941. Immediately upon liberation, therefore, the Danish cabinet and a few days later the Rigsdag (parliament) ratified the four-year old document by unanimous vote in both houses (May 16, 1945). Foreign Minister Christmas Moeller spoke of the treaty as "President Roosevelt's handshake with Denmark." In Oct. 1945 it was reported that the army air forces weather service had offered to give four of its Greenland stations to Denmark.

Greenland was important also as the world's great producer of cryolite, important in the manufacture of aluminum. Early in July 1945, the "Disko," first ship direct from Denmark after 1940, reached the colony amid great rejoicing.

**Trade and Finance.**—Exports (largely fish and fish products) in 1939 totalled 1,847,000 kroner (1 krone=19.308 cents U.S. in 1940), exclusive of export of 62,231 short tons of cryolite. Imports in 1939 totalled 4,149,000 kr. and consisted chiefly of foodstuffs (607,000 kr.), wood (468,000 kr.), manufactures (451,000 kr.), fruits and other colonial wares (389,000 kr.), meat (253,000 kr.). The government budget for 1939-40 was balanced at 6,035,000 kr.

**BIBLIOGRAPHY.**—Col. Bernt Balchen, etc., *War Below Zero* (1944), the story of earlier operations in Greenland. (F. D. S.)

**Grenada:** see WEST INDIES, BRITISH.

**Griffin, Bernard William** (1899— ), Cardinal archbishop of Westminster, was born at Birmingham, England, on Feb. 21. Educated at Cotton and Ascott colleges, he ceased his studies at the age of 19 to enlist in World War I as a member of the royal air force.

After he was ordained at 25, he continued his studies at the English and Beda college in Rome. Returning to England, he became secretary to Archbishop McIntyre of Birmingham, and later to Archbishop Williams, whose auxiliary he became in 1938. He was chancellor of the archdiocese from 1929 to 1938. At the age of 44 he was named Archbishop of Westminster, to succeed Cardinal Hinsley.

His jurisdiction as ordinary of the see extends over much the same area as that of the bishop of London. As chief metropolitan he occupies a position similar to that of the archbishop of Canterbury before the Reformation—primate of all England.

During World War II he worked unceasingly for a just and lasting peace. He was the first member of the foreign hierarchy to visit Germany upon the cessation of hostilities, to extend congratulations to the German bishops on their splendid resistance to the nazis.

He was included in the list of appointments to the Sacred College of Cardinals released on Dec. 23, 1945. He was created and proclaimed cardinal at consistory on Feb. 18, 1946.

**Grindstones:** see ABRASIVES.

**Gromyko, Andrei A.** (1909— ), Russian diplomat, was born July 5 in the village of Stayre Gromyki in the Gomel region of the U.S.S.R. After his graduation from the Minsk Institute of Agricultural Economics in 1934, he became a member of the scientific staff of the Institute of Economics of the Academy of Science of the U.S.S.R. He remained in the post until May 1939, when he was made chief of the division of American countries in the people's commissariat of foreign affairs. A few months later he resigned to become counsellor of the U.S.S.R. embassy in Washington. He served in this capacity under Ambassador Constantine Oumansky until 1941, then under Ambassador Maxim Litvinov. When Litvinov was recalled from Washington on Aug. 21, 1943, Gromyko succeeded him as Russian ambassador to the United States and also to Cuba. In Aug. 1944 Ambassador Gromyko headed the U.S.S.R. delegation during the Dumbarton Oaks conference. Gromyko attended the San Francisco conference (April–June 1945) that drew up the United Nations charter and became chief of the Russian delegation after Vyacheslav M. Molotov, the soviet foreign commissar, returned to Moscow. Gromyko, however, had little power to make decisions independently. Named chief soviet delegate to the United Nations organization, he attended the opening session of the general assembly in London, Jan. 10, 1946. He was also named Russian representative on the Far Eastern commission, the Moscow radio disclosed, Jan. 2, 1946.

**Guadalcanal:** see SOLOMON ISLANDS.

**Guadeloupe:** see FRENCH COLONIAL EMPIRE.

**Guam.** Guam is the largest and most populous of the Mariana group of islands in the North Pacific, is in 13° 26' N. lat. and 144° 39' E. long., and is located about 1,823 mi. S.E. of Hong Kong, about 1,506 mi. E. of Manila and 5,053 mi.

A CLASSROOM in Guam, 1945. Schools were reopened shortly after the island was liberated and instructors taught from memory until the arrival of textbooks. Children received formal education as well as training in the crafts, agriculture or domestic arts

S.W. of San Francisco. Pop. (1940) 22,290; area 206 sq.mi. Capital Agana (10,004).

**History.**—The Japanese captured the island, which had not been fortified, and which was in an exposed position in the midst of Japanese mandated islands, a few days after the attack on Pearl Harbor. It was retaken by U.S. forces in July 1944, and served as headquarters for Admiral Chester Nimitz in the concluding stages of World War II. During the period of Japanese occupation, one or two Americans hid out on the island, living in caves and receiving food from friendly natives.

**Government.**—Before the war the governor of Guam was a U.S. navy captain who was also commandant of the naval station. There was a native congress with advisory powers, but final authority rested with the governor. The natives of Guam are Chamorros, with an intermixture of Spaniards and Filipinos. The language is a Malay dialect, influenced by Tagal (a Filipino dialect) and Spanish. The natives were converted to Christianity under Spanish rule.

**Industry and Trade.**—Guam is an agricultural country. Production is mostly for local consumption and the island raises corn, rice, sweet potatoes, coffee, bananas, pineapples, citrus fruits, limes, breadfruit, mangoes, yams, tobacco, alligator pears, sugar cane and timber. Copra is the only export product of any consequence, the normal output being about 2,000 tons.

**Finance and Education.**—The revenues for the fiscal year 1940 were \$283,619 and the expenditures were \$259,626. The Bank of Guam was the only institution of its kind. Education between the ages of 7 and 12 was compulsory under U.S. administration. In 1940 there were 23 primary schools, five industrial schools, one high school, one private school and one school for Americans. Average enrolment was 4,694. The speaking of English was forbidden and high school education ceased under the Japanese occupation; but normal activity was being resumed in the schools in 1945. (W. H. CH.)

**Guatemala.** A Central American republic bounded by Mexico, British Honduras, Honduras and El Salvador. Area: 42,364 sq.mi.; pop. (1943 off. est.) 3,450,372, of whom two-thirds are Indian. Capital, Guatemala City (pop. 1940 census, 163,826); other urban centres are Antigua Guate-

mala (12,601), Chiquimula (10,868), Comalapa (10,461), Mazatenango (14,227), Puerto Barrios (15,784), Quezaltenango (33,538), Zacapa (14,443). Religion: predominantly Roman Catholic. President in 1945: Juan José Arévalo.

**History.**—A constitutional convention assembled Jan. 10, 1945, and remained in session until its labours were completed and a new constitution creating a semiparliamentary government, granting women's suffrage, and guaranteeing freedom of speech, assembly and press was signed March 11. President Juan José Arévalo assumed office March 15; in his cabinet were included Major Francisco Xavier Arana, Captain Jacobo Arbenz and Jorge Toriello, the members of the triumvirate which had governed Guatemala after the successful revolution on Oct. 20, 1944.

The government reported several plots against it during the year. While the constitutional convention was in session in February several persons, including former ambassador to the United States Adrian Recinos, were reportedly arrested. Early in April constitutional guarantees were suspended for 30 days, with arrests again being made among parties opposed to the administration. On June 19 further activities by three opposition political parties were banned. Constitutional guarantees were again suspended in October, with the state of siege lasting two months and with some 60 persons taken into custody. A number of individuals charged with complicity in the several plots were exiled during the year. The government also ordered returned to the state certain property granted in former years to ex-President Jorge Ubico and members of his administration.

Guatemala broke diplomatic relations with the Franco regime of Spain on Jan. 23, the first American nation to take this action (one country, Mexico, had never granted recognition); the Spanish Republican government-in-exile later organized in Mexico was granted recognition in September. Diplomatic relations were established with the soviet union by exchange of notes in Washington, D.C., on April 19. A boundary controversy with Great Britain over Belice or British Honduras, suspended during the war, was reopened. The United Nations charter was approved Oct. 12, and the Bretton Woods monetary pact on Dec. 28. A blockade on rail transportation to El Salvador which had been imposed in 1944 was lifted early in the year, and during the summer the presidents of the two nations met on the border to discuss steps designed to lead to a Central American union. A subsequent protocol eliminated many commercial barriers between the two countries. An agreement was signed with the United States on May 22 whereby the latter nation sent a military mission to Guatemala and in August several technical advisers arrived from Washington to aid in solution of problems of price control, finance and reform of statistical methods. The United States in October disclosed that Guatemala had received during the World War II period lend-lease military goods valued at \$21,089,000, an amount exceeded among the American republics only by Brazil.

The government on April 21 passed a law of economic emergency which penalized speculation in essential goods and authorized control of rents, prices, imports and wages. An earlier decree, on Feb. 25, provided that 75% of all pay rolls should go to nationals. Some labour unrest occurred pending passage of a new labour code, and in September President Arévalo forbade union activities and labour agitation among farm workers. A labour congress was held in August, and in accordance with a resolution adopted then the national labour organization joined the Confederation of American Workers (C.T.A.L.).

**Education.**—In 1943 schools numbered 2,784, with an enrollment of 152,274 students.

**Finance.**—The monetary unit is the quetzal, maintained at par with the U.S. dollar. The budget for the 1945-46 fiscal year

estimated expenditures at 25,412,216 quetzales (expenditures for 1944-45 were estimated at 15,257,452 quetzales). The government had on hand on Aug. 30 a balance of 6,354,862 quetzales, 25% of estimated expenditures; in addition 1,757,321 quetzales remaining unclaimed on the so-called "English debt" were credited to the treasury following expiration, on Aug. 20, 1945, of the period for presentation of claims.

**Trade and Communication.**—Exports for 1944 were valued at 23,856,753 quetzales, inclusive of duties, while imports were valued at 20,702,604 quetzales. Exports to the U.S. for the first nine months of 1945 were estimated to value about 21,500,000 quetzales (for the corresponding period in 1944: 16,618,937 quetzales); coffee, bananas and chicle were the main items exported. Coffee exports in the quota year Oct. 1, 1944, through Sept. 20, 1945, totalled 855,170 bags of 60 kgs. each (1943-44: 830,606 bags). The 1943-44 cotton crop was estimated at about 1,643,000 lb. of ginned cotton (1942-43: 1,969,000 lb.). Balsa production in 1944 amounted to 1,143,918 bd.ft. (1943: 871,970 bd.ft.). Refined sugar output for 1943-44 amounted to 26,000 short tons.

Railways total 600 mi. of public road, 280 mi. private. In 1944 highway mileage was estimated at 4,045 mi., of which 1,851 mi. was National Highway, 2,194 mi. departmental. Motor registration in 1943 listed 2,570 passenger cars, 624 buses, 1,144 trucks. The country has several air lines; the domestic line Aerovias was nationalized by the government early in the year. (See also BRITISH HONDURAS.)

**Guerrilla Warfare.\*** There was probably no major war in history in which guerrilla activities played as important a part as they did in World War II. The story of the guerrillas in Norway, Russia, Yugoslavia, China, France, Poland and North Africa was well publicized. The action of these bands had a very material bearing on the outcome of the war. They tied down vast numbers of axis troops, helped to maintain the morale of the overrun countries and rendered valuable aid to the regular fighting forces of the United Nations, both by furnishing intelligence and by physical encounter with the enemy. While the war with Japan was in progress, little was heard concerning the guerrilla organizations in the Philippines. Occasionally some hint of their existence and activities appeared in print, but for the most part, security considerations during the war prevented the release of much information on this interesting phase of the world conflict.

Long before the Japanese attacked the Philippines in late 1941, there was considerable discussion in U.S. military circles concerning defense of the islands in case of attack. It was assumed that successful defense in the first stages of an invasion would be very difficult because of the long supply lines from the United States. Hence, it was foreseen that guerrilla action would play an important part in delaying conquest of the islands and assisting reinforcing or liberating troops in the event they had to be retaken from a conqueror.

Long a student of the Philippines, General Douglas MacArthur concurred in this theory. Before leaving Bataan, he organized and sent out several small groups of officers who were instructed to disperse themselves, evade the Japanese and organize guerrilla bands. Each unit contained as a nucleus a few specialists with training in communications, engineering and the

\*The information presented in this account was obtained by personal interviews with several U.S. officers who took part in the activities discussed. The material concerning operations on Luzon was supplied by Lt. Col. Robert B. Lapham, U.S.A.

like. The largest group numbered about 15.

Little time was available for detailed instructions. But all knew their primary mission was to obtain intelligence, their secondary missions to harass the Japanese and to prepare for co-operative action against the enemy when reinvasion by U.S. forces began.

The officers assigned to guerrilla activities left Bataan a short time before its capture by the Japanese and made their way across Manila bay and to the east and northeast of the island of Luzon. For a while they remained together but, as the Japanese consolidated their conquest and established small garrisons in towns and villages, they became scattered. Since practically the entire native population was potential guerrilla material, the comparatively small number of U.S. officers available had to be spread as thinly as possible, both to extend the organization of guerrilla bands and to reduce the chances of capture by the Japanese. At first, until contacts could be made and local organizations perfected, the greatest problem was that of evading the enemy.

After the fall of Bataan and the surrender of Corregidor, the Japanese concentrated their attention upon the remaining outlying garrisons. Most of these also contributed increments to the guerrilla organization. As the troop units broke up, the Filipino soldiers simply donned civilian clothes, hid their arms and ammunition and went home. This was done, for the most part, automatically. Later, when the guerrilla bands became organized, many of these caches of arms and ammunition were recovered, so that there was little shortage of effective weapons.

The Filipinos, for the most part, were determined to combat the Japanese in whatever manner possible. Guerrilla units sprang up spontaneously all over the islands. Many, however, had only the leadership of local politicians or others not particularly well qualified, hence their efforts were largely uncoordinated and ineffectual.

The first big job confronting the U.S. officers was that of organizing and co-ordinating these bands nationally. Intercommunication was a problem from the start. About the only radio equipment available consisted of small receiving sets in native homes. Supplies of vacuum tubes and dry batteries for these sets were almost nonexistent. Storage batteries were obtained by salvage or stealing from vehicles. Arrangements were made to charge these periodically with small generators driven by various means. These small battery-powered receiving sets could do little more than keep the guerrillas informed as to the course of the war and pick up bits of useful information from various broadcasts. Maintenance and repair of the radio sets was accomplished by the most extensive improvisations.

For communication between guerrilla units, reliance had to be placed on messengers. Manila became the message centre. Representatives of the many bands came to that city from time to time, and information was passed around by word of mouth. Eventually, it seeped back to the other groups, often months later. Everyone expected the liberation campaign to start in a short time. There were many false alarms. When these occurred, the guerrillas would show a sudden spurt of anti-Japanese activities. Then, as nothing materialized, they would again put away their weapons and go back to civilian pursuits.

A factor which contributed to the difficulty of communication was the universal suspicion of strangers. Indeed, life in any community was exceedingly perilous for an outsider. Many were killed on suspicion alone. Naturally, this circumstance made it most difficult to circulate information and to communicate or meet with other bands. However, it had this advantage that there were very few instances in which the Japanese were forewarned concerning guerrilla plans and dispositions.

In all, there were between 50 and 100 U.S. officers engaged

ITALIAN GUERRILLAS who fought for the liberation of Milan in 1945 and who functioned in the group which liquidated Benito Mussolini and other high-ranking fascists

in guerrilla activities on the island of Luzon. During 1944, a typical guerrilla group, which consisted of about 5,000 Filipinos, included just three U.S. personnel.

Throughout 1942, the principal effort was directed toward perfecting organizations, obtaining information about Japanese troops and plans, and projecting various plans for co-operation in the anticipated return of U.S. troops. A few trial forays were made against enemy communications and other activities, some for practice and to test guerrilla tactics, others based on false rumours of reinvasion.

Late in 1942, radio contact was first established between General MacArthur's headquarters and guerrilla units on the islands of Panay and Mindanao. The prime importance of information concerning the enemy was re-emphasized and local bands were instructed to use every means to disseminate this. These first orders from outside eventually reached Manila and thence were dispersed to the northern part of Luzon, until they penetrated to all active guerrilla units. Then, limited supply by submarine began, first to Negros Island, next regularly to Mindanao and other southern islands.

The most important of the cargoes delivered consisted of radio equipment. Standard army transmitters became available for the first time, together with the generating equipment necessary for their operation. From that time on, communications improved enormously, and co-ordinated action became possible on short notice without elaborate, long-range planning. Of secondary importance, but still highly valued, were shipments of submachine guns, ammunition, explosives and medical supplies, all previously scarce.

When the bands in the north were informed that units farther south were in radio contact with MacArthur, a flow of information southward began. Along with reports on Japanese activities went requests for radio apparatus and other vital supplies, with instructions as to where they should be sent. Word was passed along that propaganda leaflets, "MacArthur" matches, and other similar material was appearing to the south. These psychological "weapons" were in great demand, and requests for them came from all parts of the islands.

Toward the end of 1943, a contact party which had come to Mindanao by submarine, proceeded by sailboat to Samar, thence to Luzon, where they arrived in April 1944. From that date forward, all the major guerrilla elements were linked by radio and submarine.

The initial landing in the Philippines, that at Leyte, came

without warning to the guerrillas on other islands. Those on Leyte received a few days' notice. The secrecy was for security purposes as the Japanese had been expecting an attack far to the south, probably aimed at Davao and other points on southern Mindanao. After the first surprise of the Leyte landings, General MacArthur kept up a flow of warning orders to the various guerrilla units, assigning missions to be accomplished following certain planned operations.

During the preliminary phases of the reinvasion, the guerrilla bands confined most of their activities to the collection of intelligence and identification of "spot" targets for attack by U.S. aeroplanes. The guerrilla combat troops were "lying low," held back for final employment against the enemy whenever General MacArthur should give the word.

The week before the first landings on Luzon took place, a message was received to start combat action. From that time on, the bands made life miserable for the Japanese. Guerrillas attacked Japanese convoys, disrupted their communications and, in general, interfered to the maximum possible extent with all their movements. These activities played a prominent part in preventing co-ordinated action by the Japanese against the invading U.S. troops. When U.S. troops reached an area, the guerrillas there joined and accompanied the United States forces, acting as guides, scouts and security patrols. Their detailed knowledge of the local conditions proved to be of great value.

Throughout the period in which the Philippine guerrilla units were active, their most important contribution to the cause of liberation took the form of military intelligence. They reported the principal dispositions of Japanese troops, as well as the general scheme of administration of the islands. Japanese units en route either to or from active theatres of operations were identified, and this information was passed on to General MacArthur's headquarters.

As an example, a certain Japanese division would be reported on Luzon. Headquarters in Australia would at once request confirmation, as the reported unit had only recently been in action, let us say, near Buna. Headquarters got the answers without delay. Knowledge of such troop movements, and the resulting ability to forecast Japanese plans and reactions was of vital importance in making the plan for the reconquest of the Philippines.

By their unified resistance to the enemy and their fine co-operation with United States forces in the liberation of their homeland, the citizens of the Philippine Islands justified every confidence that had been placed in them. They showed that organized guerrilla action in a country whose people gave such action their complete moral support, cannot be neutralized by an invader and can subject him to continual weakening and contribute greatly to his final defeat. (B. R. L.)

**Guevara, Juan Gualberto** (1882— ), cardinal archbishop of Lima and primate of Peru was born in Arequipa, Peru, on July 12. He was educated at the Colegio San Vicente de Paul, the Seminary of San Jeronimo and the University of San Agustin at Arequipa, and the Latin-American Plan college and the Gregorian university at Rome. After ordination in 1906 he was stationed at Africa while that territory was under Chilean control. Expelled from there in 1910 with five other Peruvian priests, he returned to Arequipa where he was vice rector of the seminary and attended the university before going to Rome in 1920 to continue his studies.

Before being consecrated bishop of Trujillo in 1940, Archbishop Guevara served as apostolic administrator of Huarás. In 1943 the see of Trujillo was raised to metropolitan rank and its

ordinary became an archbishop. Following the death of Archbishop Frafan in Sept. 1945, he was transferred to the primatial see of Lima.

One of 32 appointees to the Sacred College of Cardinals in Dec. 1945, he was created and proclaimed cardinal at consistory on Feb. 18, 1946.

**Gustavus V** (1858— ), king of Sweden, of whom a biographical account will be found in the *Encyclopaedia Britannica*, ascended the throne in 1907, and long before 1945 had attained the rank of Europe's oldest living monarch.

King Gustav's firm insistence on neutrality once more pulled Sweden through a world war as one of the few states not directly involved. Despite his advanced age (he was 87 in June 1945) and a minor accident when he slipped in the bathtub, he continued to exert considerable influence in affairs of state because of his judgment and popular respect for the extraordinary breadth of his experience. Even his tennis playing continued. (F. D. S.)

**Gymnastics.** Frank Cumiskey of the Swiss Gymnastic society of Union City, N.J., finally broke the three-year dominance of teammate Arthur Pitt to capture the all-around championship of the National A.A.U. gymnastic meet. Cumiskey placed first in the long horse, side horse, horizontal and parallel bars to accumulate 305.6 points to Pitt's 259.5. Their twin efforts, however, were not enough to forestall Penn State winning the team title with 60½ points to 60 for the Swiss society.

Philadelphia again dominated women's gymnastic competition by gaining the first two places in the all-around championship. Clara Schroth of the Philadelphia Turners won the all-around title with 254.8 points, followed by Marian Twining of the Loyal Order of Moose, Lodge 54, Philadelphia, with 253.4 and Meta Neumann, Lincoln Turners, Chicago, 250.6.

(M. P. W.)

**Gynaecology and Obstetrics.** The use of penicillin in obstetric work remained the most notable advance of 1945. When used during pregnancy penicillin may cause bleeding resulting occasionally in abortion. Consequently, its use in syphilis, gonorrhoea, pyelitis and other infections occurring during pregnancy must be carefully controlled. Its effects on these disorders had been confidently expected to revolutionize their treatment during pregnancy, but further investigation of Herbert M. Leavitt's findings might result in a sharp curtailment of the use of penicillin during pregnancy. Possibly this unfavourable effect might be due not to penicillin, itself, but to certain types of the mould so that this difficulty might be overcome.

During 1945 it became more clear that the effective use of penicillin must depend on the type of infecting organism because it has little or no effect on infections of gram-negative bacillary origin such as typhoid and tuberculosis. The colon bacillus, so common in puerperal infections, is resistant to penicillin.

MEDICAL OFFICERS delivered a Filipino woman of a daughter aboard an LST craft near Mindoro, Philippine Islands

Continuous caudal analgesia, as developed by Hingson and Edwards for relief of pain during labour and delivery, was displacing paravertebral block in the treatment of thrombophlebitis as a vasodilator and antispasmodic. Its advantage appeared to be in the more sustained effect, thus producing a more prolonged reaction in reducing the swelling and pain in the affected extremities.

Favourable reports continued to appear on the Hingson-Edwards caudal analgesia in labour and delivery, even including its use for caesarean section. The caution was reiterated that it must be used by experts in the technique and restricted to carefully selected cases among whom there may be no contraindications to the method. A clear understanding of all possible contraindications is an essential to expertness in the technique.

Gordon King with his associate L. T. Ride of Hong Kong made an interesting contribution on the subject of toxæmia of pregnancy, presenting evidence to show that a deficiency of vitamin B has a bearing on its causation. They had the fortitude to make extensive observations under the conditions existing in Hong Kong during 1939, 1940 and 1941. They observed the heavy increase in beri-beri during Japanese occupation and an almost parallel increase in the incidence of pregnancy toxæmia, especially pre-eclampsia and eclampsia, during that same period. Among 371 cases of beri-beri complicating pregnancy, no less than 252 cases were further complicated by pregnancy-toxæmia.

Immunochemical studies suggested strongly that the hormone-antihormone reaction is a true immunological phenomenon and that the antihormones produced are identical with ordinary immune bodies.

Investigations suggested also that a combination of hormone and vitamin therapy is indicated for the treatment of various genital disturbances, and is more effective than hormones alone. It appears that vitamin deficiency may play a part in disturbances of pituitary-genital secretion and activity.

Inhibition of lactation could be accomplished successfully without breast engorgement and pain so common to untreated cases. Stilboestrol was used for this in the United States, whereas in England the use of hexoestrol dipropionate was favoured, better results being claimed.

Argen.*, 32:365-369 (1945); Frederick Prescott and Margaret Basden, "Inhibition of Lactation by Hexoestrol Dipropionate," *Brit. Med. J.*, 2:428-430 (1944). (P. T.)

**Gypsum.** The decline in the demand for building materials after the peak of war construction is reflected in the basic data of the gypsum industry in the United States shown in the table.

Data of Gypsum Industry in the U.S., 1940-44  
(Short tons)

	1940	1941	1942	1943	1944
Mine output . . . . .	3,699	4,789	4,698	3,878	3,761
Imports . . . . .	1,405	1,348	394	231	342
Supply . . . . .	5,104	6,136	5,092	4,109	4,104
Sales . . . . .	4,632	5,760	4,953	4,186	3,838
Crude . . . . .	929	1,321	1,458	1,234	1,056
Industrial . . . . .	123	152	145	164	200
Building . . . . .	3,580	4,287	3,360	2,788	2,582

The postwar upturn in building activity had not been manifest in the gypsum industry up to mid-1945. Production during the first half of 1945 was 1,842,371 tons, or 3% less than the 1,900,093 tons in the same period of 1944.

In Canada, the world's third largest producer, the postwar recovery began to show in 1944 with an output of 596,164 short tons, against 446,848 tons in 1943, and continued into 1945, with 528,382 tons in the first three quarters. Normally the United States takes the bulk of the Canadian output, and as is shown above, imports increased in 1944, even though output declined. Great Britain is the second largest producer, with 1,532,117 short tons in 1943. (G. A. Ro.)

**Haakon VII** (1872— ), king of Norway, of whom a biographical account will be found in *Encyclopædia Britannica*, was born Prince Charles of Denmark, second son of Frederick VIII (and brother of Christian X). Upon the separation of Norway from Sweden he was elected king by the Norwegian Storting (Nov. 18, 1905), and took the old Norse name of Haakon, and that of Olav for his son, the crown prince. Haakon married Maud (1869-1938), youngest daughter of King Edward VII of England.

Haakon, rallying point for the patriotic resistance of Norwegians all over the world, had the deep satisfaction to return with honour unquestioned to his homeland after the long exile in London. Despite five years of absence and the inevitable bitterness and disruptions due to German occupation, his personal prestige appeared strengthened among a people grateful for his steadfast, sane leadership. His 40th anniversary was a significant indication of political stability. (See also NORWAY.) (F. D. S.)

**Hácha, Emil** (1872-1945), Czechoslovak statesman, was born at Trhove Sviny, Bohemia. A law student at Budejovice (Budweis) and Charles university, Prague, he took his doctorate in 1896. From 1898 to 1916 he served as state officer in the Austrian empire and during the next two years as judge in the Austrian high court of administration. Although he did not participate in the struggle which brought into being the new Czechoslovak republic, he was granted the post of senate president of the Czechoslovak high court of administration, Nov. 1918, and became president in 1925. He was also a member of the International Court at The Hague. Dr. Hácha, on Nov. 30, 1938, was elected president of the Czech republic with German backing, after the resignation of Dr. Eduard Beneš and the interim government of Gen. Jan Syrový.

In the space of a few months, Dr. Hácha witnessed the swift dismemberment of the republic and with it the reduction of his office to that of a puppet president. In mid-March 1939, he went to Berlin where he signed an already prepared document establishing the "Protectorate of Bohemia and Moravia." Any trace of real power that had originally been vested in him quickly vanished into the hands of the reich protector. During his tenure, Dr. Hácha frequently appealed to his people to co-operate with the Germans and declared in 1940 that "Germany has indeed proved to be a mighty shield—Bohemia and Moravia will have an honourable place within the framework of a victorious greater Germany." On May 5, 1945, he was arrested by Czech patriots during an uprising in Prague and was slated to stand trial as a war criminal on charges of collaboration with Germany. He died in a Prague prison hospital, June 27.

**Haiti.** A West Indian republic occupying the western third of the island of Hispaniola or Haiti. Area: 10,695 sq.mi. Estimates of the population, which is considered the heaviest per sq.mi. in Latin America, vary widely; an official est. for 1943 was 3,500,000. The pop. is almost entirely Negro. The capital is Port-au-Prince (pop. 125,000); other cities are Les Cayes (15,000), Cap Haitien (about 15,000), Gonaïves (20,000), Jacmel (10,000). Official language: French; official religion: Roman Catholic, with many persons practising the folk religion of vodun or voodoo. President in 1945: Elie Lescot.

**History.**—The year 1945 proved to be generally uneventful politically, with the only disturbing incident the announcement by the government on Aug. 13 that two men, sentenced to death in March for a conspiracy to assassinate President Lescot, had been executed. Five other men were arrested for distributing leaflets against the government. Military censorship to preserve public order was reportedly decreed June 17.

Haiti participated in the Inter-American conference at Mexico City and the United Nations conference at San Francisco and the national assembly unanimously approved ratification of the United Nations charter on Aug. 8. On Aug. 27 a decree was published ending censorship on correspondence both at home and abroad. The Haitian quota to the United Nations Relief and Rehabilitation administration was set at \$40,000 with the contribution to be increased later if possible. In December a cultural agreement with Venezuela was ratified.

The economic situation of the republic was classed as fairly good, although some shortages, such as newsprint, were felt, and imports continued limited in quantity.

**Education.**—Statistics on education are questionable since enrolment does not mean attendance; only some 10% of the population is estimated to be literate. In 1941 schools were listed as 835 primary, with an enrolment of about 85,000; 35 intermediate, with 5,768 pupils (exclusive of the normal school); 6 schools of higher education, with 236 pupils.

**Finance.**—The monetary unit is the gourde, fixed by law at a value of 20 cents U.S. Revenue for the fiscal year ended Sept. 30, 1945, amounted to 41,890,043 gourdes (1943-44: 42,370,365 gourdes). Expenditures for 1944-45 amounted to 42,516,000 gourdes. The surplus at the end of the fiscal year totalled 3,283,000 gourdes (Sept. 30, 1944: 4,778,000 gourdes); the gross public debt amounted to 52,936,000 gourdes (Sept. 30, 1944: 60,460,000 gourdes).

**Foreign Trade.**—Exports for the 12 months ended Sept. 30, 1945, were valued at 85,561,000 gourdes (1943-44: 80,542,000); imports, 65,770,000 gourdes (1943-44: 80,155,000 gourdes). The U.S. took 78.38% of exports and supplied 83.77% of imports, compared with 65.26% and 69.44%, respectively, in 1943-44. The United Kingdom took 14.37% of imports and supplied 4.12% of exports in 1944-45, compared with 24.22% and 5.68%

in 1943-44. Exports are mainly agricultural.

#### Haitian Exports, 1944-45 and 1943-44

Product	1944-45	1943-44

(D. Ro.)

**Halsey, William Frederick, Jr.** (1882— ), U.S. naval officer, was born Oct. 30 in Elizabeth, N.J. An Annapolis graduate, he commanded a destroyer patrol force in World War I. Subsequently he was commander of the aircraft carrier "Saratoga," commandant of the Pensacola naval air station, and, in 1938, commander of a carrier division. Vice-Admiral Halsey led the attack against Japanese bases on the Marshall and Gilbert Islands, Jan. 31 and Feb. 1, 1942. On Oct. 24 he replaced Vice-Admiral Robert Lee Ghormley as commander of U.S. naval forces in the South Pacific. Halsey won naval victories off the Solomon Islands in 1942 and off Bougainville in 1943. On June 15, 1944, he became commander of the U.S. 3rd fleet in the Pacific. He supported General MacArthur's land forces in the Leyte island invasion, Oct. 1944, and together with Vice-Admiral Thomas Cassin Kinkaid's fleet, routed the Japanese imperial navy in the battle for Leyte gulf (Oct. 22-27, 1944). In 1945, Halsey's 3rd fleet assisted in the Luzon invasion (Jan. 9) and directed carrier attacks and naval shellings on the Japanese islands of Kyushu and Honshu in June and July. He led the battleship "Missouri" into Tokyo bay and attended the surrender ceremonies aboard the warship (Sept. 2). After his return to the U.S., he relinquished his command, Nov. 22, declaring that he was ending his "sea-going career of slightly over 45 years." He was named for promotion to the rank of admiral of the fleet, Nov. 28, and said he intended to retire.

**Hammer Throw:** see TRACK AND FIELD SPORTS.

**Hand-ball.** The annual classic of this sport was held in 1945 on the new glass-enclosed courts of the Town club of Chicago, Ill., with a good representation of players who were in the various military services. For the first time, an ex-champion came back to regain his singles title. Joseph P. Platak (U.S. navy) representing the Lake Shore club of Chicago, who was dethroned in 1944 in the finals of the singles by Frank Coyle of the New York Athletic club, reversed the performance by winning the title from Coyle, making it his ninth victory in this event. National tournaments in other branches of the sport were not held.

#### National Four-Wall Rankings for 1945

Singles	Doubles
1. Joseph P. Platak, Chicago, Ill.	1. Sam Atcheson and Ed. Dettwiller, Memphis, Tenn.
2. Frank Coyle, New York, N. Y.	2. R. Kendler and F. Laser, Chicago, Ill.
3. (No play-off held)	3. W. McGreevy and L. Peressin, St. Louis, Mo.

(Fr. Ro.)

**Hannegan, Robert Emmet** (1903— ), U.S. politician and cabinet member, was born June 30 in St. Louis, Mo. He took his law degree at St. Louis University, 1925. He started his political career in 1933 as a democratic committeeman of a St. Louis ward. By the end of that year, he had become chairman of the city central committee and was becoming an important figure in the Democratic political machine. During the era of vote fraud investigations in St. Louis and the state of Missouri, Hannegan and some of his followers were accused of being involved in ballot-box stuffing. Hannegan promptly countered with accusations that the Republicans were involved in fraudulent voting operations themselves. Although the charges were never cleared up, the political machine controlled by Hannegan and Mayor Bernard F. Dickmann of St. Louis was defeated in April 1941.

In May 1942, Hannegan was appointed by President Roosevelt to the post of collector of internal revenue of the eastern district of Missouri. In Oct. 1943, he was appointed commissioner of internal revenue in Washington, D.C. President Roosevelt then suggested that Hannegan be named chairman of the national Democratic committee, a post which he accepted on Jan. 22, 1944. During the Democratic national convention in Chicago, Ill., July 1944, Hannegan was said to have favoured Truman above Wallace for the vice-presidency on grounds that Wallace was a "political liability." On May 2, 1945, President Truman announced the appointment of Hannegan as postmaster general of the U.S. and Hannegan took office June 30.

**Harbours:** see RIVERS AND HARBOURS.

**Harmon, Clifford B.** (1866?–1945), U.S. aviation pioneer, was born in Urbana, O. He went to New York as a young man, made a fortune in real estate and became a motoring and then a ballooning enthusiast. He established an altitude record for balloons of 15,997 ft. in 1909, which was not surpassed for 14 years. He became interested in heavier-than-air craft, imported his own plane and obtained a pilot's licence. During World War I, he was attached to the signal corps, aviation section, and was promoted through the grades to a colonel. He trained fliers, and fostered research in the development of the aeroplane. He recognized the potentialities of aircraft as a war weapon. In 1910, he staged a bombing exhibition on Long Island before naval officers but they were left skeptical by the performance. He went to Paris, where he continued to live for most of his life and there founded the Ligue Internationale des Aviateurs, becoming its first president. Its prizes for outstanding achievements in world aeronautics became known as the Harmon trophies. When the League of Nations began its discussions on disarmament and international policing, Col. Harmon suggested to the council that an international air force, heavily armed, would be the most effective police power. Although it was rejected amid a storm of protest, Col. Harmon had some satisfaction in knowing that at last his plan had received some serious consideration. After the German occupation of Paris, he went to Cannes. There he died on June 25.

**Harmon, Millard Fillmore** (1888–1945?), U.S. army air officer, was born Jan. 19, in Fort Mason, San Francisco, Calif., the son of an army officer. He was graduated from the U.S. military academy at West Point, 1912, and from the Signal Corps Aviation school, 1916. Harmon served in the Pershing expedition to Mexico, 1916–17, and flew with the famous French Groupe de Combat No. 13 during World War I. He was made a major general of the U.S. air corps in July 1941 and was promoted to the rank of lieu-

tenant general in Feb. 1943. He was commanding general of the 2nd air force from July 1941 to Jan. 1942 and was appointed commander of all army air forces on Guadalcanal and the South Pacific islands in Feb. 1943. In Aug. 1944, he was appointed commander of the army air forces of the Pacific area and deputy commander of the 20th air force. Gen. Harmon was known as an air force tactician of sound judgment. During the Solomons campaign, he refused to be stampeded into retaliatory raids by the early Japanese aerial successes over the islands in April 1943 and adhered to his basic plan of striking hard at the enemy's most vulnerable targets. He wasted little time minimizing Japanese fighting ability, but was convinced that U.S. pilots and planes were superior to the enemy's. Gen. Harmon and nine other airmen aboard a converted bomber were reported missing March 3, after they took off for Hawaii from an undisclosed point in the Pacific area and were long overdue. When the plane failed to appear, it was presumed that Harmon and the others aboard the craft were dead.

**Harris, Sir Arthur T.** (1892— ), British air officer, was born April 13 in Cheltenham, England. Educated in English public schools, he enlisted during World War I and joined the royal flying corps in 1915. He commanded several squadrons on the western front. Made an air commodore in 1937, he was named air vice-marshal in 1939 and rose to commander in chief of the R.A.F. bomber command in Feb. 1942. A firm believer in mass raids, Air Marshal Harris developed the "saturation" technique of mass bombing—that of concentrating clouds of bombers in a giant raid on a single city with the object of completely demolishing it. Sir Arthur applied this method with great destructive effect on axis-occupied Europe from 1942 to the end of World War II. The air ministry announced on Aug. 26, 1945, that Sir Arthur planned to relinquish his post as commander in chief of the R.A.F. bomber command in September and retire shortly thereafter.

**Harvard University.** Founded in 1636, Harvard is the oldest institution for higher education in the United States. Gifts during the academic year 1944–45 were \$3,124,965.77. At the beginning of the academic year, July 6, 1945, there were but 433 students enrolled; this was because the summer term, a nine-week course, was mostly for freshmen, returned veterans and special upperclassmen who needed extra credits. As of the fall term, Sept. 24, 1945, the civilian student enrolment was 3,500, of which 1,072 were veterans, as compared with a peacetime average of 8,000. However, many of the university's facilities were occupied by 1,759 army and navy men sent to Harvard for specialized training. A great deal of wartime research was conducted in the university laboratories.

All departments of the university operated on a 12-month 3-semester schedule in 1945, two regular 16-week terms and an optional 12-week intensified summer term.

(For statistics of student enrolment, faculty members, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

**Hawaii.** The territory of Hawaii consists of a group of eight larger islands and numerous islets in the Pacific ocean between latitudes 18° 55' and 22° 15' N. and between 154° 50' and 160° 30' W. longitude. The total land area is 6,441 sq.mi. The islands are of volcanic origin. From southeast to northwest, they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition, stretching northwestward beyond Niihau more than 1,100 mi. is an archipelago of rocks,

reefs and shoals including Midway (longitude 177° 22' W.) which, although part of the archipelago, is not politically a part of the territory. However, Palmyra, a coral atoll consisting of 55 islets, 5 mi. long and 2½ mi. wide, located 960 mi. south of Honolulu, is a part of the city and county of Honolulu. The largest of the islands and the youngest, geologically, is Hawaii, with a land area of 4,021 sq.mi. The capital of the territory is Honolulu, on the island of Oahu. It is a completely modern city. Its 1940 census population of 179,326, exclusive of military and naval personnel, was estimated to have increased to 261,033 on June 30, 1945. The civilian population of the territory in 1940 was 423,330. The 1945 estimate was 502,122. The racial origin of this population, in addition to the native Hawaiians and the Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese.

**History.**—Ingram M. Stainback, appointed by the president, took office as governor on Aug. 24, 1942. Joseph R. Farrington was elected territorial delegate to congress in 1944. Tax collections by the territorial government in the fiscal year ending June 30, 1945, totalled \$39,842,855 compared with \$39,480,826 for the previous year. Cash on hand and in banks on June 30, 1945, totalled \$34,851,739 as compared with \$35,545,507 for the previous year. Hawaii was the principal base for operations in the war in the Pacific, and all civilian activities were subordinated to military requirements. Military control over civilian activities was terminated by presidential order on Oct. 24, 1945.

**Agriculture.**—Hawaii's chief crops and the bases of its industry are sugar and pineapples. Although labour shortages, nonavailability of heavy equipment and the loss of lands devoted to military use combined to hamper production during the war years, 1944 sugar production totalled 851,868 tons compared with 951,411 in 1940, and canned pineapple and pineapple juice production increased during the war years, large quantities of these products being delivered direct to the armed forces.

**FILMS.**—*People of Hawaii* (Encyclopædia Britannica Films Inc.). (E. G. A.)

**Hay.** The 1945 total U.S. production of all kinds of hay was estimated by the United States department of agriculture at 104,900,000 short tons which is unusually large but not quite equal to the 105,000,000 ton crop of 1942. There was considerable loss due to wet weather but the supply was large in relation to the number of animals to be fed. The acreage harvested was about the same as in 1944 and the yield only slightly larger.

The total crop included 91,573,000 short tons of tame hay, 33,671,000 tons alfalfa, 32,592,000 tons mixed clover and timothy and 13,378,000 tons wild hay. These totals represented an increase in alfalfa of 5% over 1944 and 17% above the average while wild hay yielded only about the same as in 1944. The principal tame hay states continued to be Wisconsin 7,180,000 tons, New York 6,013,000 tons, California 5,686,000 tons, Iowa 5,568,000 tons and Minnesota 4,786,000 tons. California led in alfalfa hay production with 4,213,000 tons followed by Wisconsin 2,080,000 tons, Minnesota 2,038,000 tons, Iowa 1,960,000 tons and Idaho 1,855,000 tons.

Lespedeza hay increased in 1945 after two years of decline and established a new record of production of 7,622,000 tons compared with an average of 4,294,000 tons, 1934-43. The big gains were in Tennessee where the crop of 1945 was about double that of 1944, and in Missouri where the increase was large. This hay was growing in favour in the southern states. Sweet clover hay was only 61% of the ten-year average. The tonnage of soybean hay declined sharply, 23% in acreage grown for hay and the crop harvested was only 2,695,000 tons compared with a ten-year average of 4,890,000 tons. The harvest

of peanuts for hay was about the same as in 1944 and 50% above the average.

**Hayseed.**—The production of the six principal hayseeds, alfalfa, red clover, alsike, sweet clover, lespedeza and timothy, totalled 526,000,000 lb. in 1945, which was 8% less than the 575,000,000 lb. crop of 1944 but 28% larger than the ten-year average 1934-43. Lespedeza seed production was 16% below the record crop of 1944 but much above the average. The other five hayseed crops were only 2% below 1944 and 2% above the average. The rainy season at harvesttime handicapped the gathering of seed and the high price of seed together with incentive payments failed to get an increased production. The efforts to increase the production of seed was primarily to secure a large supply for export although the carry-over of these six seeds was 47% larger than a year earlier. The quality of the 1945 crop was lower than that of 1944 when ideal weather favoured the harvest. Alfalfa seed production was about the same as in 1944 though the acreage harvested was 14% less than in 1944. The 1945 red clover seed crop was the second largest on record, only 11% below that of 1944 but 41% above the ten-year average. The yield was very low, .78 bu. per acre compared with the average of 1.11 bu. Alsike yielded a crop 32% above 1944 and 11% above the average. Sweet clover seed production was 9% less than a year earlier and 28% below the average, though the yield was about the average. Timothy yielded 9% more seed than in 1944 but 13% below the average. Red top produced a record crop of 24,300,000 lb. compared with 16,300,000 average 1939-43. Sudan-grass harvest declined 55% in acreage and 10% in yield, which returned only 27,400,000 lb. compared with an average of 52,500,000 lb. (See also ALFALFA; SOYBEANS.) (J. C. Ms.)

**Heart and Heart Diseases.** During 1945 the greatest advance in the knowledge and treatment of cardiovascular diseases came in the difficult and much neglected field of congenital defects. The cause of such defects has always been obscure and often vaguely ascribed in major part to defects of the original germ plasm. The first ray of light came from Australia where first N. M. Gregg and later C. Swan demonstrated the manifold effects on the foetus of German measles (rubella) in the mother during the first two months of pregnancy. Such effects include cataracts, congenital heart disease and often mental retardation. Such sinister results of what had been commonly regarded as a rather trivial disease aroused great interest and were a spur to maternal protection against this disease and to a consideration of early termination of pregnancy if German measles occurs within two months of the onset of pregnancy. Much more exploration along these lines was obviously needed.

The exact diagnosis of the individual congenital cardiovascular defects also became an important necessity of the day because of the possibility in many cases, especially in those with patency of the *ductus arteriosus*, of surgical cure. Children are sometimes needlessly sent long distances to expert cardiovascular surgeons because of errors in diagnosis. Although an experienced and capable physician can make correct diagnoses in the great majority of cases above the age of infancy, there were still some patients and some defects clinically insoluble; and it is often helpful in cases that seem clear to have more proof. Such information and proof were obtainable by the technique of catheterization of the heart chambers via the brachial and subclavian veins and superior *vena cava* with a specially adapted ureteral catheter inserted under X-ray control. The study of

the blood gases and pressure so obtained affords much help; thus in the case of an auricular septal defect there is much more oxygen in the right auricle than in the superior *vena cava*, in the case of a ventricular defect more oxygen in the right ventricle than in the right auricle and in the case of patency of the *ductus arteriosus* more oxygen in the pulmonary artery than in the right ventricle. The procedure is not hazardous.

Spectacular advance was made in the surgical treatment of some defects. Ligation and transection of the patent *ductus arteriosus* introduced in 1938 steadily progressed so that many cases were being successfully operated upon, relieving the strain on many hearts and doubtless preventing subacute bacterial endocarditis. Early in the year 1945, A. Blalock and H. B. Taussig in Baltimore, Md., devised and carried out an ingenious operation to bring poorly oxygenated blood to the lungs of cyanotic cases of congenital heart disease, particularly those with the tetralogy of Fallot. The innominate or subclavian artery was anastomosed with one of the main pulmonary trunks. The procedure is a difficult and hazardous one and several cases succumbed but other patients (mostly young children) were relieved of their cyanosis and were doing well by the close of the year. The limitations and possibilities of the operation still needed exploration and definition but the success of this bold therapy was most promising in a number of cases of this most difficult and dangerous of congenital heart diseases. Finally, during 1945, both in Sweden and in Boston, Mass. (by R. E. Gross), coarctation (narrowing) of the aorta was boldly attacked to relieve the obstruction to the blood flow to the lower half of the body; Gross resected the narrow aortic segment, anastomosing the two cut ends of the aorta above and below the coarctation, with good results in a few cases.

Another addition of cardiovascular disease came in an entirely different field, namely that of the effect of virus infections on the myocardium (heart muscle). At the time of the severe influenza epidemic of 1918 there was a good deal of loose talk about the "influenza heart" which was found to be, in the majority of cases at least, a misnomer for postinfectious neurocirculatory asthenia. The pendulum then swung to the extreme of considering such virus heart disease as nonexistent. Proof came of myocardial as well as pulmonary disease of virus origin, even fatal in its consequences in rare cases: Just how much slight to moderate myocardial involvement may result from influenza or other virus infections is not yet known; this is a problem for the future, but it is unwise to be unduly worried about the heart after any infection except rheumatic fever or severe diphtheria.

A third experience in the study of cardiovascular disease during 1945 that held promise for the future was the elaboration and spread of knowledge concerning the dietetic treatment of congestive heart failure. In 1905 in France it was realized that a limitation of sodium chloride ingestion was helpful in the control of oedema or dropsy. This fact was not, however, applied generally in cardiac treatment in the decades that followed. Following laboratory studies in the biochemistry of fluids and salts in 1925 it was found by L. H. Newburgh and his associates that strict limitation of salt intake with free and full intake of water was helpful in clearing oedema due to kidney disease. In 1941 and 1942 H. A. Schroeder and also S. Proger and L. B. Ellis pointed out that in cardiac oedema the limitation of salt, and not the limitation of fluid, was the crucial factor in giving relief. F. R. Schemm in 1942 and 1944 advised the liberal use of fluids along with the low salt intake in the treatment of congestive heart failure. Meanwhile through all these years most doctors the world over were treating congestive heart failure from dropsy by limitation of fluids and sometimes of salt in addition to the use of digitalis, diuretics and rest. The fluid limitation was a natural idea doubtless dating back to the earliest treatment of disease and it has for the most part continued without contradiction through the centuries. Rather abruptly, the lessons learned in a few laboratories and clinics were being spread abroad and as a result an important "new" addition was added to the armamentarium against congestive heart failure. During 1945 at the Massachusetts general hospital, for example, the treatment of obstinate congestive heart failure radically improved due to the application of the principle that the less sodium taken in and retained in the body the less water accumulates in lungs, liver and legs. Water is given freely up to two or three or more litres in 24 hours where previously it had been restricted to one litre or a little more and the patient's distressing thirst is completely alleviated. The sodium chloride intake which in ordinary diets ranges from four to ten grams a day is cut down to two grams or less, and this makes all the difference in the world; in fact, every fraction of a gram of sodium is important in the water balance. To help in lowering the salt intake sufficiently it was found that salt free bread was an important item, along with care to avoid any sodium medication (for example, soda bicarbonate for hyperacidity and "gas"). It must be noted, however, that this salt restriction is not a replacement for other useful therapeutic measures like rest, digitalis and diuretics, but rather a valuable adjunct.

White, "Experiences During the Past Year at the Massachusetts General Hospital in the Dietetic Treatment of Congestive Heart Failure," presented before the New England Heart Assn. (Nov. 26, 1945).

**FILMS.**—*Heart and Circulation* (Encyclopædia Britannica Films Inc.). (P. D. W.)

**Helicopter:** see AVIATION, CIVIL.

**Helium.** No official report was made by the close of 1945 revealing the progress in helium output in the United States during World War II, but it was generally known to have increased several fold, through the addition of new plants and the enlargement of the single prewar plant. The chief war use was for the inflation of blimps for submarine patrol work, and increased amounts were used in weather observation balloons. One of the latest applications was the substitution of helium for air in the inflation of transport plane tires, 13 lb. of helium replacing 92 lb. of air. (G. A. Ro.)

**Hemp.** The production of hemp in the U.S. was greatly reduced in 1945 with the end of the war emergency needs. Only 8,500 ac. were planted for both fibre and seed in two states, Wisconsin and Kentucky, compared with 72,600 ac. planted in five states in 1944. Production of fibre in 1945 was estimated at 6,762,000 lb. compared with 51,632,000 lb. in 1944 and seed at 420,000 lb. compared with 528,000 lb. in 1944 all of which was grown in Kentucky. A small amount of hemp was grown in the United States for many years but production was greatly expanded to meet war needs when imports ceased. In 1943 the acreage reached the high total of 226,000 ac. for both fibre and seed, nearly all being grown under government contracts. War Hemp Industries, Inc., controlled the crop and contracted for the acreage. During the emergency 42 plants were built for government operation. During 1945 these plants were active in processing the 1944 crop but were to be closed in most of 1946. Hemp fibre cannot be produced profitably in competition with other imported fibres when normal trade is resumed. The Italian hemp crop, normally of considerable importance, was sharply reduced by the war and also by the drought of 1945. The 1944 crop was estimated to be about 123,000,000 lb. (J. C. Ms.)

**Herriot, Edouard** (1872- ), French politician, was born July 5 at Troyes in Champagne. See *Encyclopædia Britannica* for his early career. The elections of May 1932, marked by a swing to the left, brought Herriot back into power as premier and foreign minister for the third time. While he opposed Germany's claim to armament equality, he did agree at the Lausanne conference, June 1932, to reduce German reparations. Herriot valued U.S. friendship and insisted that France should pay its war debt instalment to the U.S. at the appointed time. But the chamber of deputies balked and his government was overthrown on Dec. 14, 1932. Herriot was vice-premier in the Doumergue cabinet (1934) and the Flandin government (1936), and in June 1936 he was named

president of the chamber of deputies. He remained in France after the German occupation in June 1940, and at first showed little opposition to Vichy rule. But in Aug. 1942, when Marshal Henri Pétain dissolved the permanent bureaus of the senate and the chamber of deputies, Herriot and Jules Jeanneney wrote a vigorous joint protest to the senate. For this he was arrested in 1942. In 1944, it was erroneously reported that Herriot had died while in custody. On April 25, 1945, a Moscow dispatch disclosed that he had been liberated from a German prison camp by Russian soldiers. He returned to his native Lyons (May 19) where the day before he had been re-elected mayor. Testifying at the trial of Marshal Pétain (July 30), he accused the old marshal of having staged a *coup d'état* in 1940 when he abolished the third republic. Herriot was elected to the new constituent assembly during the national elections, Oct. 21.

**Hershey, Milton Snavely** (1857-1945), U.S. confectioner and philanthropist, was born Sept. 13 in Derry Township, Pa., of Mennonite parents. See *Encyclopædia Britannica* for his early career. In 1944, Hershey resigned as president of three of his enterprises—the Hershey Industrial school, the Hershey corporation and the Hershey Trust company. He retained, however, the post of chairman of the board of the Hershey Chocolate company. He died in Hershey, Pa., Oct. 13.

**Hewitt, Henry Kent** (1887- ), U.S. naval officer was born Feb. 11 in Hackensack, N.J. A graduate of the U.S. Naval academy, 1906, he was commissioned an ensign in 1908. He won the naval cross for distinguished service in World War I, and later served as commander of a destroyer division. He was inspector of ordnance in charge of the naval ammunition depot at Puget sound and commanded the cruiser "Indianapolis." He was promoted to rear admiral in Dec. 1940.

Adm. Hewitt was named to command the U.S. naval units in the huge Allied fleet that protected the U.S. landings in North Africa Nov. 8, 1942. He commanded the naval engagement that helped force the surrender of Casablanca. In recognition of his services in North Africa he was made a vice-admiral in Nov. 1942. Adm. Hewitt's fleet also played its part in the Sicilian campaign in 1943 and in the attack on the Italian mainland, particularly the landings at Salerno.

Adm. Hewitt had command of all Allied naval forces in the invasion of southern France in Aug. 1944. He was nominated for the rank of admiral by President Roosevelt, March 29, 1945, and on May 8 he was assigned by Secretary of the Navy James Forrestal to conduct further investigations into the Pearl Harbor attack. On July 14, he was designated commander of U.S. naval forces in Europe, succeeding Adm. Harold R. Stark.

**Higashi-Kuni, Naruhiko**, PRINCE (1887- ), Japanese statesman, was born Dec. 3, the ninth son of Prince Asahiko-Kuni, and a second cousin of the emperor. His wife was the ninth daughter of Emperor Meiji, and the prince established in 1906, by order of Meiji, the separate imperial house of Higashi-Kuni. After his return from France, where he was a student, 1920-27, he was given command of an infantry regiment. In 1935, he was named high military councillor and was renamed to this post in 1937, when he was promoted to the rank of general. On April 16, 1945, Higashi-Kuni was named supreme war councillor. After Emperor Hirohito made his surrender broadcast, Aug. 15, the Suzuki cabinet resigned in "disgrace," and Higashi-Kuni formed a new cabinet, Aug. 16. He assumed concurrently the posts of premier and war minister. The following day, the new premier

ordered the army to "refrain from any outbursts of emotion . . . and carry out the emperor's instructions to the letter." Adjusting his policies to the exigencies of defeat and of foreign occupation, he said (Sept. 1) that a policy of "friendship" would help Japan regain its place in world leadership and economy. Subsequently Higashi-Kuni asserted (Sept. 5) that Japan had been rapidly losing the war before the atomic bomb was used or Russia entered the conflict. He denied (Sept. 18) that either he or the emperor had been war criminals, alleging that the emperor had been deceived by the militarists who had planned the Pearl Harbor attack. Higashi-Kuni resigned (Oct. 5), and on Nov. 10 he said that he had requested the emperor's permission to become a commoner again because of the "corrupt customs" of the imperial household system.

**Highways:** see ROADS AND HIGHWAYS.

**Hillman, Sidney** (1887- ), U.S. labour leader, was born at Zagare, Russia, March 23, the son of a merchant. He left school to work in a chemical laboratory in Kaunas. In 1907 he came to the U.S., and worked first as a clerk, then as a garment cutter. He was president of the Amalgamated Clothing Workers of America, 1915. In Jan. 1941, President Roosevelt appointed him associate director general of the Office of Production Management, and Hillman played an important part in preventing and settling defense strikes. In July 1942, Hillman resigned as special assistant to the president on labour matters to return to his old job as president of the C.I.O. Amalgamated Clothing Workers. In 1944, as chairman of the Political Action committee of the C.I.O., he was responsible for an overwhelming turnout of labour voters to insure the re-election of President Roosevelt.

In 1945, Hillman threw the weight of the C.I.O. Political Action committee into the battle for confirmation of Henry A. Wallace as secretary of commerce. He attended the World Trade Union conference in London and urged (Feb. 13) immediate creation of a new permanent world labour organization which would speak for Labour in the peace settlement. On May 11, Hillman gave up his chairmanship of the National Citizens Political Action committee, but retained chairmanship of the C.I.O. Political Action committee. On Oct. 6, he was elected as one of the vice-presidents of the new World Federation of Trade Unions.

**Himmler, Heinrich** (1900-1945), head of the German police, was born Nov. 7 at Munich. He studied agriculture at the University of Munich and later became a member of the Academy of German Law. In 1927 he became deputy leader of the *Schutzstaffel* (known as the S.S., Black Shirt or Elite Guard troops) and he was appointed leader in 1929. Himmler was reich director of propaganda, 1926-30, a member of the reichstag and Prussian state council, 1933, commander of the united German police forces, 1936, and deputy head of the reich administration, 1939. He was empowered by Adolf Hitler to suppress anti-nazi resistance at home and in the occupied countries, and his methods were brutal and ruthless. The fuhrer made Himmler interior minister on Aug. 24, 1943, and by Nov. 1944 it appeared that the gestapo chieftain had assumed executive control over Germany, replacing Goering as the No. 2 nazi. In early 1945 it was believed that Himmler had supplanted even Hitler as real ruler of the reich, presumably because the latter had been incapacitated by the assassination attempt of July 20, 1944, although he was still Germany's titular head. This belief gained credence in late April 1945, when it was learned that Himmler had submitted a peace offer to the United States and Great Britain, but not to the soviet union—

an offer which was rejected. After the Doenitz government was formed, Himmler went into hiding. He adopted a disguise which might have proved effective, but his identity papers, made out in the name of Hitzinger, aroused suspicion of British soldiers at Bremervoerde and Himmler was arrested on May 21. He revealed his identity and was placed under strict custody. According to newspaper dispatches, an examining physician, looking for concealed poison, attempted to open Himmler's mouth. The gestapo chief thereupon broke a vial of poison carried under his tongue, and died a few minutes later on May 23.

**Hirohito** (1901— ), emperor of Japan, was born April 29, the son of Emperor Yoshihito. At the age of eight he entered the peers school, and at the age of 10, he was commissioned as a sub-lieutenant in both the army and navy. He broke away from his sheltered life in 1921 and toured Europe, becoming the first Japanese crown prince to visit the western world. In 1924 he married Princess Nagako Kuni. Hirohito became prince regent in 1921, ascended the throne in 1926, and the era of his reign was called "Showa" or Light and Peace. The part played by Hirohito in the Japanese aggressions has been a moot point. Although his apologists asserted that he was "outside" politics, he approved the various Japanese acts of aggression from the seizure of Manchuria in 1931 to the attack on Pearl Harbor a decade later. On Pearl Harbor day, Dec. 7, 1941, he proclaimed the nation at war with the United States and the British empire. During the early part of World War II, when Japan was amassing victories, the emperor remained in semi-seclusion. Toward the end of the war, however, he admitted in an imperial rescript that the situation was "truly grave." After the Potsdam declarations, the atomic bombings and Russia's entry into the war, the Japanese indicated they were willing to end the conflict provided the emperor retained his prerogatives. President Truman answered (Aug. 11, 1945) that Hirohito would be permitted to retain his throne for the time being, subject to the authority of the supreme Allied commander. Thus Hirohito on Aug. 15 (Tokyo time), 1945, broadcast to his subjects that he had ordered acceptance of the "provisions of the joint declaration" of the Allied powers. On Sept. 27, the emperor broke with precedent and paid a call on Gen. MacArthur, supreme Allied commander. Two days earlier he declared in interviews with foreign correspondents that he opposed war as an instrument of national policy. He blamed Hideki Tojo, former premier, for "misusing" his war rescript, and pledged that any social reforms in Japan would be made by constitutional means. In mid-December, Gen. MacArthur ordered the abolition of Shinto as the national religion. Two weeks later, in a rescript issued Jan. 1, 1946, the emperor declared to be false the "conception that the emperor is divine and that the Japanese people are superior to other races and fated to rule the world."

**Hitler, Adolf** (1889-1945?), German nazi leader, was born at Braunau on the Inn, Austria, April 20. For a general account of his career see *Encyclopædia Britannica*.

*Götterdämmerung:* 1945.—Uncertainty clouded the details of the grand finale, but no doubt existed that devastating vengeance had encompassed the fuehrer and his followers. The officers' plot of July 20, 1944, had wounded the dictator, but

failed to destroy him. Many of the conspirators paid a bloody price for the attempt to salvage themselves and Germany. Relentlessly the Allied armies converged on Germany in the fall of 1944 from west, east and south. German strength was unequal to the task. Fanatic leadership could no longer produce enough planes or rockets or soldiers. As the invading armies drove into the heart of Germany the nazi leaders intrigued among themselves. Himmler complained of Hitler's health and his abnormal way of life, turning night into day and sleeping only two or three hours. By early April 1945, Heinrich Himmler, Walther Schellenberg, chief of the German intelligence service, Franz Seldte, minister of labour, and Count von Krosigk, minister of finance, were in contact with each other trying to find a means to put Hitler aside and end the war. Doctors disagreed as to whether or not the fuehrer was incapacitated by Parkinson's disease, and even Himmler hesitated to take forceful action.

On swept the Russians. Hitler's entourage urged him to fly to Berchtesgaden and continue the struggle from there. This he had intended to do, but changed his mind, possibly under the influence of his mistress, Eva Braun, who wished to die with him a martyr's death. On April 22 Hitler declared to a staff conference that the war was lost and that if Berlin fell he would die there. On this day he suffered an attack of nervous prostration and violently blamed everyone else for the German tragedy. According to the circumstantial account worked out by British intelligence officers in the next five months, Hitler never thereafter left his bunker in the reichschancellory. He regained a certain calm punctuated during the next tense days by occasional spasms of despair and recrimination. With him remained Dr. Josef Goebbels, Martin Bormann, Eva Braun and members of

"YOU DID ALL THAT!" Cartoon by Burck which appeared in the *Chicago Times* on May 3, 1945

his personal staff. As the Russians surged closer to the heart of Berlin and shells fell about the bunker, Hitler finally knew that the great gamble had failed. On April 29 in the evening he married Eva Braun, and then retired to a bizarre wedding feast where the talk was apparently all of suicide. He destroyed his pet Alsatian dog, and at about 2:30 A.M., April 30, said goodbye to some 20 people gathered in the bunker. Then, supposedly, the bridal pair retired to death—he by a shot through the mouth, she by poison. Mid-afternoon of the 30th some 40 gal. of gasoline were brought into the garden outside the bunker. The body of Eva Braun was brought out, and another body wrapped in a blanket; both bodies were soaked with the gasoline and burned, and the charred remains broken up and buried. Presumably the second body was that of Adolf Hitler, and telegrams from Goebbels and Bormann sent out on May 1 both asserted that Hitler had died the day before. Escape alive was well nigh impossible, and various reports of Hitler's appearance in Argentina or elsewhere proved to be unfounded.

In all probability Hitler's death by suicide preceded by a week the final surrender of the Nazi Reich—but absolute proof may never appear.

A document, discovered in Germany and reported to be Hitler's "political testament" was released by Allied authorities on Dec. 30, together with a personal will and marriage document, all dated April 29, 1945. The testament charged international Jewish interests with responsibility for World War II, declaring Hitler's strong aversion to the conflict. Germany was urged to strengthen its resistance, and a rebirth of the Nazi movement was predicted. Himmler and Goering were expelled from the party and all their state offices for secret negotiations with the Allies and for "illegally attempting to seize control of the state." Their successors were named. Also named, to carry on the war, was a cabinet headed by Karl Doenitz. The document recorded Hitler's choice of death rather than surrender or capture by the enemy. (See also GERMANY.)

**Hockey:** see ICE HOCKEY.

**Hodges, Courtney H.** (1887— ), U.S. army officer, was born Jan. 5 at Perry, Ga., the son of a country editor. In 1906 he joined the army as a private, and three years later was commissioned a 2nd lieutenant. He served with distinction in World War I, and was with the army of occupation in Germany, 1919. In World War II he became a major general in 1941 and a lieutenant general in Feb. 1943, when he assumed command of the 3rd army (later taken over by Gen. George Patton). Hodges commanded an army corps during the invasion of France, 1944, and later took over the 1st army. Sandwiched between the British-Canadian forces and Patton's 3rd army, the 1st army swept through north-western France and captured the town of Aachen on Oct. 20, 1944. Gen. Hodges resumed his advance beyond Aachen in the general offensive launched Nov. 16. His army was thrown back in the German surprise counteroffensive launched in mid-December.

The 1st army recovered from this blow and in Feb.-March 1945, Hodges led his forces up to and across the Rhine river. He was appointed a full general, April 17. After the European phase of the war ended, Hodges and the 1st army returned to the United States for redeployment to the Pacific theatre of war. The Japanese phase was over, however, before Hodges could see action in that theatre, and on Oct. 21 it was announced that the 1st army would change over to a peacetime and administration unit.

**Hogs.** The number of hogs on United States farms on Jan. 1, 1945, 60,600,000 head, reflected the great decline in 1944—the greatest on record—of more than 23,000,000 head from the 83,852,000 head reported on Jan. 1, 1944. This great decline of 28% resulted from several conditions—short feed in early 1944, marketing difficulties because of gluts at slaughter centres, labour shortage and shipment difficulties. The spring pig crop of 1945 was 51,687,000 head compared with 55,428,000 in 1944 and the fall crop 35,300,000 head or about 4,000,000 more than that of the fall of 1944. The total pig crop was only slightly more than in 1944 or about 87,000,000 head compared with the record crop of 121,706,000 in 1943.

Hog slaughter dropped early in 1945 and continued to run much below 1944 but at about the average for 1934-43. In general the supplies were less than demand despite the reduced needs of military and export programs. An increase in the pork supply for 1946 was indicated by the increase in the fall pig crop, however, which suggested that hog production might be stabilized at about the level of prewar years or slightly higher.

The total production of pork was estimated at 10,190,000,000 lb. in 1945 compared with 12,893,000,000 lb. in 1944 and the high record of 13,349,000,000 lb. in 1943. During the first half of 1945 the government required that about 50% of pork production be set aside for government purchase. This requirement was reduced as soon as the end of the war became evident.

Hog prices were stabilized at a level above 1944. The support price of \$13 per 100 lb. was authorized to Sept. 1, 1946. Hogs sold at ceiling prices through 1945. This price was \$14.75 per 100 lb. at Chicago until Oct. 9 when it was increased 10 cents per 100 lb. The large corn crop suggested that the volume of pork to be produced in the winter 1945-46 would increase and prices might decline to the minimum. The stocks of old corn were about 50% larger than a year earlier. Increased hog production in Canada, Argentina and Australia was expected to cause a decline in export demand after the supplies for relief had been provided, although hog numbers in Europe were estimated to be one-third less than in prewar. **Home Economics.** The American Home Economics association in the United States reported a 20% increase in its membership for 1945. High school home economics club members totalled in 1945 100,000; while the college and university clubs reported a membership of 18,000. High school home economics clubs in 1945 used this activity in an organized way in their social program particularly through their nationally organized club known as Future Homemakers of America, a group sponsored jointly by the American Home Economics association and the U.S. office of education.

The American Home Economics association placed special emphasis in its 1945 program of work on four major themes: (1) planned saving and spending; (2) housing; (3) family relationships; (4) wise use of consumer goods.

The material was widely used for work with adult classes; in organized school programs, elementary through college; with larger groups of rural extension workers in connection with farm security and food and nutrition projects; and by social agencies and business organizations. Much of this material released through the American Home Economics association was used in 1945 by home economists in fields of journalism, radio, television and films.

Many countries in which efforts had been extended only to

low income or dependent families were looking toward a program similar to the one in the U.S. where home economics deals with families on all levels. During 1945, an increasing number of women students from Latin America showed interest in home economics, most of them in specific activity fields—nutritionists, laboratory technicians, extension workers, teachers.

The co-operative extension service in agriculture and home economics (U.S. department of agriculture, War Food administration) during the fiscal year 1945 helped women in 3,415,820 homes with problems of food, clothing, work-habits and family relationships. This was accomplished through the efforts of 2,579 county home demonstration agents and 819 war food assistants aided by specialists from land-grant colleges and voluntary local leaders. Assistance was given with the production and preservation of food to 25,000,000 families—home gardens, canning, storing, freezing and drying were emphasized. In spite of wartime rationing, 1,740,405 families were assisted with improving diets; 1,363,888 families with food preparation; 179,507 families with child feeding problems; 406,343 families in building up stronger resistance to colds and common diseases through proper diet and invalid feeding. Women were assisted with the buying and care of clothing and textiles, especially important because of shortages in at least 2,294,314 homes. Increased efficiency in household tasks was accomplished in 628,397 homes. An improvement in family relationships was initiated in 233,168 families. Removing fire and accident hazards from 568,577 homes were recorded by adult groups in addition to the 700,000 recorded by juniors.

The bureau of human nutrition and home economics (Agricultural Research administration, U.S. department of agriculture) directed its efforts along five lines: it furnished families with information designed to help with day-to-day problems; supplied basic facts to agencies responsible for programs affecting civilian welfare; laid plans for meeting postwar problems; focused its research on some of the specialized needs of the military services; and made fundamental contributions to science. As fast as the results of its research became available, the bureau gave the facts to the layman through organized programs of the Office of War Information, printed bulletins, press, radio talks, charts and pictures.

Completed in 1945 were tables giving the composition of 275 common foods in terms of 11 nutrients. These figures covered protein, fat, carbohydrates, iron, phosphorus, calcium and five important vitamins.

**Textiles and Clothing.**—Because of the need for consumer information on the relative utility and quality of fabrics on the market, nearly 600 samples of staple clothing fabrics from 15 cities of various sizes located in five sections of the U.S. were examined during 1945. Laboratory study of the quality of these fabrics including shrinkage, colour fastness and breaking strength would be of value in determining the fabric properties necessary in different qualities of staple textile materials as well as disclosing existing trends in fabric quality.

Serviceability studies were also made on such household fabrics as plain curtain marquisettes, commonly used upholstery materials such as cotton tapestry and cotton damask. A study comparing various physical properties of cotton fabrics knitted from natural mercerized carded and combed yarn was completed. Investigations were continued on chemical treatments for single yarns; these included gums, starchy waxes, resin and glues of various types.

Research on chemical finishes for rendering household textiles resistant to mildew was continued in order to determine the permanence of such treatments under various weathering and storage conditions.

Techniques of measuring and recording dimensions and contours of the foot believed to be pertinent to the shaping, sizing and fitting of shoes were explored and analyzed statistically with a view to establishing standards for reliability of measurements needed in the pioneer field of research. Standards of workmanship and construction features for inexpensive ready-to-wear clothes were studied.

More than 17,000,000 pieces of literature were sent out on request by the bureau of human nutrition and home economics. Further dissemination of information was made by the staff through 20 printed bulletins, 18 previewed publications, 26 technical articles, 140 popular articles for magazines, 48 radio broadcasts on nation-wide networks, 8 scripts for syndicates, 4 film strips and 1 motion picture film.

During 1945, 15 projects were undertaken in co-operation with agricultural experiment stations and other research agencies in various states.

The Office of Experiment Stations (Agricultural Research administration, U.S. department of agriculture) again reported that the effect of World War II on research program in home economics at the agricultural experiment stations had been to increase the emphasis on food and nutrition. Looking toward increased interest in problems of housing, household equipment and home management, new researches were begun within the year 1945, bringing the projects in this field to a total of 20.

During 1945, 34 progress notes on the projects were issued by 20 states. These are included in mimeographed list of "Progress Notes of National Cooperative Projects." (See also DIETETICS; FOOD RESEARCH.)

**Home Loan Bank, Federal:** see HOUSING.

**Home Owners' Loan Corporation:** see HOUSING.

**Honduras.** A republic of Central America, bounded by Guatemala, El Salvador and Nicaragua. Area: 59,145 sq.mi., with some territory in dispute. Pop. (1945 census) 1,201,310; by the 1940 census it was 1,107,859. The capital is Tegucigalpa, with a pop. (1945) of 55,715; other leading cities are San Pedro Sula (22,116) and La Ceiba (12,185). Smaller urban centres are Choluteca (1940 pop. 5,057), Santa Rosa (6,018) and Tela (8,969). Religion: Roman Catholic; language: Spanish. President in 1945: General Tiburcio Carías Andino.

**History.**—In general 1945 was a peaceful year in Honduras with the exception of an attempt at revolt in April. Small bands composed of exiles made an invasion from Guatemala and there were skirmishes in the Copán area in the northwest. By the end of the month the government reported that the revolt had been crushed.

In December a news account stated that remaining political and military prisoners in the country had been freed by President Carías shortly before Christmas. During a session of congress in the first months of the year a series of war emergency measures for World War II was approved including one expropriating axis assets. War censorship was ended Sept. 12, and a state of siege declared earlier in the war was lifted by congress Dec. 18, 1945.

The soviet union was granted recognition by Honduras late in March. In July the United Nations charter was approved by the president, and congress took similar action in the December session. The Bretton Woods monetary pact was signed Dec. 28.

Economic conditions improved somewhat as increased shipping brought the banana industry back toward normal, but severe food shortages were reported in August, notably of sugar. On June 30 the Institute of Inter-American Affairs terminated its food program in the republic, turning over to the government its food production and demonstration units. A severe October hurricane on the north coast did damage estimated at from \$10,000,000 to \$15,000,000.

The United States in October disclosed that lend-lease military goods sent to Honduras during World War II amounted in value to \$313,000.

**Education.**—Primary schools (1942) numbered 1,083, with an enrolment of 55,567; 18 intermediate schools had 2,544 pupils and the National university an enrolment of 378.

**Finance.**—The monetary unit is the lempira, valued at approximately 49 cents U.S. in 1945. During the fiscal year 1943-44, Honduras for the first time in several years operated with a surplus (\$181,461 U.S.); the external debt was reduced to \$1,761,937 and the internal debt to \$5,017,192. Money in circulation on Dec. 31, 1944, amounted to \$6,465,457, with U.S. coins amounting to 48% of the money in circulation. The budget for 1944-45 was balanced at 11,384,521 lempiras.

**Trade and Resources.**—In the 1943-44 fiscal year exports were valued at \$9,462,532 and imports at \$12,227,944. The U.S. supplied about 64% of imports and took approximately 85% of exports. Bananas and precious metals made up 71%

of 1944 exports: the former amounted to 10,359,159 stems, while gold exports were valued at \$751,429, silver at \$1,343,172 and antimony at \$15,710. Coffee exports for the Oct. 1, 1944–Sept. 30, 1945, quota year amounted to 6,052,105 lb. Coconuts exported in 1944 totalled 13,641; citronella oil, 32,556 lb.; mahogany, 990,795 bd.ft.; crude rubber, 245,324 lb.; abaca, 944,625 lb. of fibre and 43,200 lb. of tow. Rice production (1943–44) amounted to 145,977 quintals (1942–43: 185,628 quintals).

**Communication.**—Railway mileage was estimated at about 900 mi. (1942), and highway mileage to 780 mi. of which 450 were surfaced. Completion in the latter part of 1944 of the Potrilleros-Pito Solo highway link, constructed jointly by the government and the Institute of Inter-American Affairs, was said to have reduced truck rates into the interior by more than one-third. A domestic air line was inaugurated Sept. 15, 1945.

**FILMS.**—*Central America* (Encyclopædia Britannica Films Inc.). (D. Rd.)

**Honduras, British:** see BRITISH HONDURAS.

**Honey:** see BEEKEEPING.

**Hong Kong:** see BRITISH EMPIRE.

**Hops.** The 1945 hop crop in the United States was 55,810,000 lb., 17% above the 47,695,000-lb. crop of 1944 and 42% above the ten-year average of 39,240,000 lb. for 1934–43. A favourable season brought the Washington crop to 21,000,000

U.S. Production of Hops by States, 1945, 1944 and 10-Yr. Average

State	1945 lb.	1944 lb.	1934–43 average lb.
Oregon . . . . .	20,398,000	17,204,000	18,069,000
Washington . . . . .	21,352,000	17,028,000	10,996,000
California . . . . .	14,378,000	13,608,000	10,175,000

lb. or twice the average for that state. Total hop acreage was about 41,000 in 1945 compared with 37,000 in 1944, and an average of 34,000. (J. C. Ms.)

**Hormones:** see ENDOCRINOLOGY.

**Horse Racing.** Horse racing in the United States in 1945 reflected the disturbed and abnormal conditions prevalent throughout the country and the world to an extreme degree. Everything connected with it was involved, and a summing-up of extreme condensation can, of necessity, take little or no notice of much that was unprecedented. The year began with a peremptory order, drastic in its provisions, not only closing all race tracks but prohibiting the transportation of race horses, by either train or public truck, either from one track to another, or even their shipment to their home stables. The purpose was to facilitate the movement of troops and munitions for war purposes. The discrimination worked hardship upon horsemen and was much complained of particularly since baseball and other sports were allowed to continue. This order was in operation for nearly five months. Many great meetings had to be declared off and it was not until mid-May that the ban was lifted. The season then so belatedly begun was soon, however, proceeding at a tempo so extraordinary that when it closed at the end of 1945 all U.S. turf records for attendance, amount of money paid out in stakes and purses and wagered upon the results were broken, within a period of but seven and a half months as against the usual 12.

By Dec. 31 a grand total of \$32,217,010 had been paid out in stakes and purses as against \$29,159,099 during the entire 12 months of 1944. This was the first time the \$30,000,000 mark had been reached or passed. The total number of races run was 19,496 as against the previous record of 19,228. The total number of persons attending was 17,227,548; total amount of money wagered through the totalizators, \$1,421,951,753, as against \$1,

209,973,122 in 1944, an increase of nearly \$212,000,000. On Sept. 22 for the first time the \$5,000,000 mark for a single day was reached at Belmont park, with an audit of \$5,016,745, while a new record for wagers on a single race of \$791,837 was established at Santa Anita park on June 30. The taxation revenue to the various state treasuries derived by law from this source was \$68,734,898, while aside from this the various track managements contributed the sum of \$8,813,125 for war relief and other charitable purposes.

The richest race of 1945 was the Santa Anita Handicap, for all ages, won by Louis B. Mayer's Thumbs Up and worth \$82,925, net. The richest three-year-old stake was the Kentucky Derby, which netted \$64,850 to Hoop, Jr., owned by Fred W. Hooper. The richest for two-year-olds was the Washington Park Futurity, worth \$58,650 to Spy Song, owned by Charles T. Fisher. The leading money-winning horse was Mayer's three-year-old filly Busher, by War Admiral—Baby League, by Bubbling Over, winning ten of her 13 races and \$273,735, which, with her previous earnings of \$60,300 as a two-year-old, gave her a grand total of \$334,035, the largest amount ever won by a female thoroughbred in any country. She was unanimously voted the "Horse of the Year" at the close of the season by two polls of experts. The largest winning two-year-old was Mrs. Elizabeth Graham's colt Star Pilot, by Sickle—Floradora, by Bull Dog, credited with \$185,365. The largest winning older horse was Mrs. Ethel D. Jacobs' four-year-old colt Stymie, by Equestrian—Stop Watch by On Watch, with \$225,375; this being also the largest sum ever won by a thoroughbred of that age. As illustrating possibilities upon the U.S. turf it may be noted that Mrs. Jacobs' husband, who also trains the colt, bought him out of a claiming race a little over a year before for but \$1,500, the horse having been weeded out of his breeder's stable as worthless.

The leading winning owner of the season was Mrs. Elizabeth Graham whose Maine Chance Farm stable captured \$589,170 and narrowly missed beating the record of \$601,660 established by the Calumet Farm stable in 1944. Had the season not been so short Mrs. Graham's horses must almost inevitably have posted new figures in this department. Her trainer, Tom Smith, naturally led in his division with \$510,655. The leading race winning trainer was S. Liepiec with a score of 127. The leading race-winning jockey was Job Jessop, with 290 out of 1,085 mounts. Among the money-winning jockeys the leader was Johnny Longden, whose 180 winners and 212 placed horses earned \$981,977, a new record of its kind.

On the breeding side there were also many new records made, among which the most important was that erected by the leading sire of the season, Samuel D. Riddle's War Admiral, son of the most renowned U.S. thoroughbred of modern times, Man o' War, also owned by Riddle. His offspring, by winning 58 races, earned \$588,997; this not only surpassed the previous mark of \$437,141 turned in by Equipoise in 1942 by a wide margin, but also was the first instance in breeding history in which the get of any one stallion won \$500,000 or more in a single year. As for blood-stock values, they experienced a similar rise. A total of 982 yearlings were sold at the various auctions for the sum of \$5,061,220, an average price of \$5,153.99 per head, eclipsing all previous sets of figures.

**Harness Racing.**—The popularity of the sport greatly increased and the success of the hundreds of meetings held throughout the United States, largely in connection with state, county and other fairs, was both uniform and pronounced, but no figures were available giving official returns. The "Horse of the Year" was again, as in 1944, the bay colt Titan Hanover, by Calumet Chuck—Tisma Hanover, by Peter the Brewer, owned jointly by E. Roland Harriman and Elbridge Gerry. To

HOOP JR., winner by five lengths of the 71st Kentucky Derby on June 9, 1945

a world's record of 2:00 for two-year-olds gained the previous season he added a new one of 1:58 for three-year-olds and swept through the principal stakes for his age undefeated. The most valuable race for him was the Hambletonian, which grossed \$51,046.96. Market values for standard-breds also showed a sharp upward trend. (J. L. HE.)

Great Britain.—Horse racing in Great Britain during 1945, although still on a much restricted scale, gave every sign of an early revival to peacetime levels. The courses on which meetings were held were crowded to their utmost capacity, and record prices were paid for thoroughbred yearlings at the Newmarket sales in September.

Lord Derby won the One Thousand Guineas and the Oaks with Sun Stream, a filly by Hyperion—Drift, trained by W. Earl and ridden by H. Wragg. The Two Thousand Guineas provided a narrow victory for Lord Astor's colt, Court Martial, by Fair Trial—Instantaneous, who beat Sir Eric Ohlson's Dante by a neck. Dante, by Nearco—Rosy Legend, may have been unlucky as he had not fully recovered from an eye injury. In any case Dante was an easy winner of the Derby, in which he beat Lord Rosebery's Midas and Court Martial.

These four substitute classic events were all run on the July course at Newmarket as in previous war years, but the St. Leger was decided at York. Dante was a short-priced favourite before the race, but had to be scratched because of a leg injury, and success went to Chamossaire. Squadron-Leader Joel's colt, by Precipitation—Snowberry, had been fourth in both the Two Thousand Guineas and the Derby. He was ridden by T. Lowrey and trained by R. Perryman.

The best of the older horses was Ocean Swell, by Blue Peter—Jiffy, who won the Ascot Gold Cup for Lord Rosebery. Lord Derby's colt, Gulf Stream, by Hyperion—Tideway, won the Gimcrack stakes at York and proved the best of the two-year-olds. The winning owners' and breeders' lists were headed by Lord Derby, and G. Richards was once again champion jockey.

A yearling full-brother to Dante was bought at the Newmarket sales by the Gakwar of Baroda for 28,000 guineas, nearly double the previous highest price paid for a yearling in Great Britain. The aggregate for the sales was 537,030 guineas for 318 lots, an average price of 1,688 guineas for each yearling, which easily beat the previous record set up in 1928 at the Doncaster sales.

Outsiders were successful in both the Cesarewitch and Cambridgeshire handicaps, which were run on the Newmarket Rowley mile course for the first time after the war. The northern-trained Kerry Piper, owned by Sir Hervey Bruce, won the Cesarewitch by a short head from Lady Crusader at odds of 25 to 1, and Esquire, a 40 to 1 chance, beat Joan's Star in the Cambridgeshire. Esquire, who had never won a race previously, was ridden by an apprentice, G. Packer, whose first success it was. (A. K. B.)

**Horses.** The number of horses and colts declined through 1944 and on Jan. 1, 1945, was 4% less than a year earlier. The U.S. department of agriculture estimated the total to be 8,897,000 head on Jan. 1, 1945, compared with 9,302,000 head a year earlier and a ten-year average of 10,872,000 head. The number of colts raised was 12% smaller in 1944 than in 1943 and only 37% as large as in 1937 and the smallest in 70 years.

The value of horses also declined in the face of gasoline rationing and power shortages on farms. The average farm

value per head was estimated to be \$64.80 on Jan. 1, 1945, compared with \$78.80 a year earlier. This decline was contrary to the general wartime rise of farm animal prices and after a sharp advance in 1943. The shortage of manpower on farms was believed to have caused a shift to mechanical power with the use of fewer horses. In 1918 horses and mules made up 26% of the animal units on U.S. farms but in 1944 the ratio was only 13%.

There were six slaughterhouses operating to produce horse meat for market through 1943-45 with a production exceeded only in the period 1928-32. Total slaughter of horses in 1945 was up to nearly 70,000 head compared with 52,063 head in 1944 and 56,400 head in 1943. A considerable volume of horse meat was prepared for export to be distributed by U.N.R.R.A. for consumption in Europe. The bulk of the usual production before the war, averaging about 20,000 head, was used in the making of prepared dog foods. Only very small amounts were used for human consumption in the U.S. In 1945 the numbers of wild horses increased in such numbers in Montana, the Dakotas and neighbouring states that special efforts were made to dispose of them. The prices of horses generally dropped so low that the capture and marketing of these animals was unprofitable to the rangers. Considerable numbers of horses were sold at very low prices from all range areas since the horse could not compete with tractor power.

**Mules.**—The number of mules and mule colts in the U.S. on Jan. 1, 1945, was estimated to be 3,408,000 head compared with 3,531,000 head a year earlier. The ten-year average 1934-43 was 4,275,000 head. The decline in number of mules was not quite so great as in horses but continued the steady decline begun in 1925 when there were about 6,000,000 head on U.S. farms. The use of mules by the army continued to decline rapidly and only small numbers were needed in reconstruction work abroad. Some shipments were made to Europe for relief purposes but in limited numbers.

The southern states showed declines in numbers greater than the average for the country. Texas, the leading mule state, lost 7% of its mules. Only Tennessee and Alabama maintained their mule population. Nearly two-thirds of the mules of the country were owned in the southcentral states, as follows: Texas 372,000; Mississippi 346,000; Alabama 294,000; Tennessee 288,000 and Arkansas 223,000. In the south Atlantic

cotton belt Georgia had 298,000 head and North Carolina 289,000 head. (See also SHOWS.)

**Horse Shows:** see SHOWS.

**Horticulture.** The sudden end of World War II in 1945 found European horticulture in a deplorable condition, especially in the invaded countries. The Netherlands' famous orchards in the Betuwe district were found completely ruined, many of the trees having been cut down by the Germans to construct fortifications. Rebuilding was started. The noted woods between The Hague and Scheveningen, destroyed by the Germans, were replanted in part by the school children. Some 450,000 ac. in the Netherlands, flooded by the Germans, and 50,000 ac. otherwise damaged, presented a long-time problem. Nevertheless, a considerable area devoted to high-grade daffodil and tulip bulbs was saved and limited shipments to the United States were resumed in the fall, after six years.

French horticulture suffered less, but reports from other invaded sections were discouraging. Farmers everywhere risked their lives when they started to cultivate their fields, because of unexploded mines.

Shipments of 20,000 tons of seeds went from the United States to Russia early enough for spring planting. Seeds were sent to many other European countries in the spring and harvests were reaped in the fall of 1945. Seeds in the fall were shipped to China for planting in the spring of 1946. In prewar times, Europe exported great quantities of seed to the United States and other countries, but 1945 saw a great increase of seed growing in the United States for shipment to Europe, creating a situation which undoubtedly would require much readjustment.

Great Britain did much to rehabilitate horticulture in 1945,

A NEW VARIETY of rose, appropriately named "Peace," caused a sensation among rose fanciers in 1945, and was chosen the All-America Rose Selection for 1946

with a horticultural advisory council to assist in a change-over from peacetime to wartime production. Greenhouse owners concentrated on the production of tomatoes, and old orchards were brought back into production. The growing of flowers and ornamental plants showed some increase, with growers being permitted to keep a nucleus for expansion later.

In the U.S., victory gardens in great numbers increased the production of vegetables but interest in vegetable growing slackened perceptibly with the end of the war and dealers reported greatly increased orders for ornamentals.

Most important developments were new insecticides and fungicides. DDT, perfected in Switzerland during World War II, proved the most effective insecticide ever developed for saving woodlands and street trees from gypsy moths and elm leaf beetles. Gratifying reports were received about its use in vegetable gardens and fruit orchards, but with qualifications, as there were indications that it might destroy bees and other valuable insects and might have unexpected effects on growing plants. It was applied successfully to forests by means of aeroplanes and helicopters.

The use of hormones to kill unwanted plants was advanced, a preparation called 2-4-D being put out for destroying dandelions, plantain, ragweed and other broad-leaved weeds in lawns. Pyrethrum, long scarce, became more available. Rotenone remained in short supply, with 90% being received from Peru, which produced double the amount sent out before World War II.

"Peace" was the all-America rose selection for the year and caused a sensation because of its unusual size and lasting qualities. It was introduced from France.

The 1945 award of the George Robert White medal of honour for service to horticulture went to Theodore Wirth, Minneapolis, Minn.

**Flower Shows.**—The only major flower show in the United States in 1945 was that held by the Massachusetts Horticultural society in Boston, Mass. The Boston show was continued throughout the war because it could be held in the society's own building, Horticultural hall, while in all other cities halls had to be rented.

The attendance was about 60,000 as against nearly 100,000 in normal times. Restrictions on travelling hampered this show.

However, many exhibitions of limited size were held in cities and towns throughout the country, indicating the continued and growing interest in such exhibitions. A new trend was indicated in several cities where fairly large shows were held in department stores which gave the space and for which no charge was made. A new organization called Roses, Incorporated held a well attended show in Milwaukee, Wis.

Plans were announced late in the year for resuming major shows in New York, N.Y.; Detroit, Mich., and Oakland, Calif. The Society of American Florists announced that it would resume its annual exhibitions in 1947 but that they would be held in Chicago, Ill., each year thereafter instead of being held in different cities. It was announced also that camellia shows would be resumed in Georgia and other southern states. Philadelphia's annual show was expected to be resumed in 1947. The New York show, in normal times the largest in the country with an attendance running up to 150,000, was to be held in Grand Central palace, which was taken over by the armed services for the duration of the war.

Garden clubs, which have very great influence, were to participate in most of the important shows. (See also BOTANY; VEGETABLES.) (E. I. F.)

**Hospitalization Insurance:** see INSURANCE.

**Hospitals.** The end of World War II in 1945 released the flood of hospital expansion and new building projects held in abeyance in the U.S. Many of these projects included needs accumulated during the "blue thirties" when materials were plentiful but money was lacking. Few of these projects took physical form, but governing boards, administrators and architects were deep in planning. Pay roll cost rose from a prewar 50% to 60% to 65% of the total cost of operation. This emphasized the need for functional planning on the assembly line principle in the realization that operating costs can be held down to the patients' ability to pay only if the layout of the physical plant permits the utmost economy of personnel, professional, technical and lay.

During 1945 the American Hospital association made three significant contributions toward better planning of individual hospitals and their integration into a sound nation-wide system.

The first was the provision for associate membership for architects who proved their familiarity with hospital planning requirements and their skill in incorporating this knowledge into hospital plans. The number of such accredited architects promised to be small but so distributed geographically that their services as consultants would be conveniently available to governing boards and local architects in all parts of the United States.

In lieu of its annual convention prevented by the shortage of transportation and hotel facilities, the association issued two booklets of major value in the proper development of hospital facilities for the U.S. people. The first pertains to the individual hospital including standards for appraisal of the hospital needs of the community, the organization of the governing board and of its medical staff, and principles of planning the hospital plant. The second presents the picture in its national aspects including the problems facing hospitals as a whole, federal grants-in-aid for surveys and construction, hospital care for veterans, hospital care for the medically indigent, the relation of Blue Cross plans to hospital management and the future of hospitals in Canada.

A third activity of importance was the work of the Commission on Hospital Care, a subsidiary of the association. This commission sponsored a nation-wide survey of hospital facilities, each state making the survey of its own facilities but the commission lending its aid by suggestion of techniques as developed by its pilot survey of Michigan, and by the provision of such coding and analytical service as may be needed. All but two states had completed, started or planned such surveys. Their completion would leave each state in possession of all the factual data needed for any planning of a state-wide system of hospitalization that may be desired.

The Hill-Burton bill authorizing grants-in-aid to states for state-wide hospital surveys and for assistance in construction funds where the need can be demonstrated passed the senate. Because of the work of the Commission on Hospital Care it was probable that by the time funds became available under this act approximately one-half of the states would already have the organization and all the factual data ready for putting its provisions into effect without delay.

The reorganization of the Veterans' administration promised to have a broad effect on civilian hospitals. The new administration announced a policy of assigning veterans needing hospitalization under the G.I. Bill of Rights to their local hospitals for treatment of acute or short-term illness and limiting its own building program to provision for long-term hospitalization. This was expected to provide occupancy for 150,000 hospital beds in local community hospitals and to reduce the need for new federal construction from the originally estimated 300,000 to 150,000 beds.

Surveys indicated that medical officers returning from the military services and eligible for the educational features of the G.I. Bill of Rights would approximately double the previous demands for residencies in hospitals. Provision of these educational advantages threatened to far exceed the clinical facilities available in hospitals having staffs sufficiently well organized to conduct an effective residency educational program.

(W. P. ML.)

**Housing.** Housing became a problem of the greatest urgency in the United States in 1945. There had been an under supply of adequate housing when World War II began. Home building during the war was restricted to areas where war workers required homes. The amount of war housing construction was far below the amount built in even the least productive peacetime period. Not even the normal growth of population was cared for; inadequate homes had further deteriorated and were unacceptable; the marriage rate had increased and increased the demand for homes.

As of Sept. 1945, 1,500,000 families were living doubled up, sharing homes or apartments with friends, relatives or strangers. It was estimated that there would be 3,500,000 new marriages in 1946 and a corresponding additional demand for homes; that the 5,000,000 families could be partially cared for by using 100,000 available temporary houses which could be moved to other localities, by using vacant military barracks and other military living accommodations, by using an anticipated 945,000 vacancies, by rehabilitating structurally sound obsolete structures, by converting empty commercial and industrial buildings into living quarters and by building 500,000 new homes. It was estimated that 3,000,000 new homes would still be required to relieve the growing shortage.

Federal, state and municipal authorities sought means to supply the demand. On Dec. 12 the president appointed Wilson W. Wyatt, former mayor of Louisville, Ky., housing "expediter" in the Office of War Mobilization and Reconversion (OWMR).

Between Jan. and Aug. 1945 there were three types of housing for which priorities for building materials were issued. (1) H-1 for migrant war workers, (2) H-2 to relieve general congestion and (3) H-3 to relieve individual hardship. H-2 and H-3 priorities continued in force until Oct. 15 when all priorities were lifted. However, the demands of industrial, commercial and residential building were too great for the limited output of building materials. Therefore, in December a priority system was reinstated giving preference for materials to builders constructing dwelling units costing less than \$10,000.

Between July 1940 and Aug. 31, 1945, private financing had supplied 836,382 new permanent H-1 units and 199,106 H-1 units converted in existing structures. Public financing had supplied 195,847 new permanent dwellings, 81,197 demountable dwellings, 277,829 temporary family dwellings, 49,376 converted dwellings, 175,860 dormitory units, 81,136 trailers and other stopgap units. Under the H-2 program 1,571 privately financed dwellings were built, 23,526 were under construction and priorities had been issued for 78,159; 44 publicly financed dwellings were under construction and priorities had been issued for 4,395. (They were terminated.) Under the H-3 program (all privately financed) 12,900 new dwellings were built, 41,800 were under construction and 16,746 priorities had been issued; 28,077 conversions were made and 8,452 were under construction.

On March 31, 1945, congress increased the authorized limit for insurance under section 603 of the National Housing act (title VI) from \$1,700,000,000 to \$1,800,000,000. No appropriation was necessary to make this increased insurance effective.

New residential building was 57.7% greater in the first ten months of 1945 than in the same period in 1944, from \$300,000,000 to \$473,000,000. A portion of this increase was attributed to increased cost and to the construction of more expensive homes after ceiling restrictions were lifted. Work was begun on 19,480 new family dwelling units in Oct. 1945 whereas in Oct. 1944 only 7,469 were begun.

Although home production increased when restrictions were removed, the immediate and the anticipated demand for new housing was far in excess of production. On Dec. 8, John Snyder, director of OWMR, reported to the president that "as a result, the threat of inflation is greater in this field than in any others. It is very serious." Because of the shortage sales prices mounted. Because prices were controlled on rental housing and were not controlled on houses for sale, houses which had rented were taken from the rental market and sold at fantastic prices, and comparatively little new rental housing was being constructed. The president asked for legislation authorizing the control of the sales price of new and of old housing, a request which had been refused repeatedly when made by the Office of Price Control. Congress, however, was tuning its ears to the clamour of homeless veterans and giving serious attention to the price control features of the Patman bill, H.R. 4761, introduced in the house of representatives on Nov. 20, 1945.

Important considerations of comprehensive housing legislation to care for future health and living standards were begun on Jan. 9, 1945, by the senate subcommittee on housing and urban redevelopment (subcommittee of the special committee on postwar economic policy and planning) under the chairmanship of Senator Robert Taft. The committee, consisting of Senators Taft, Robert F. Wagner, Allen J. Ellender, Clayton D. Buck, George L. Radcliffe, Dennis Chavez, Robert M. La Follette, issued its report Aug. 1, 1945, following which Senators Wagner and Ellender introduced legislation (S.1342). S.1342 was revised and on Nov. 14, 1945, a new bill, S.1592, was introduced by Senator Wagner for himself and Senators Ellender and Taft. Hearings on it were held from Nov. 27 to Dec. 18. The bill provided for the establishment of a permanent National Housing agency (NHA); gave NHA the power to do research, make market analyses and assist local planning; amended existing aids to privately financed housing; provided for new FHA provisions designed to bring home ownership and mutual home ownership to lower income groups through smaller down payments, longer amortization periods and lower interest rates; provided for yield insurance on money directly invested in rental housing; provided loans to purchase land for urban development and redevelopment and grants to write off excessive land costs so that private enterprise could rebuild; provided loans and grants for slum clearance and publicly financed low-rent housing; provided aid for rural housing; provided for the disposition of federally owned housing including permanent war housing. (See also BUILDING AND CONSTRUCTION INDUSTRY; BUSINESS REVIEW; CENSUS DATA, 1945; FEDERAL WORKS AGENCY; MUNICIPAL GOVERNMENT; PUBLIC HEALTH ENGINEERING; WASHINGTON, D.C.)

**BIBLIOGRAPHY.**—Publications and releases of the National Housing agency, Federal Housing agency, Federal Public Housing authority.

**National Housing Agency.**—The National Housing agency was established by executive order on Feb. 24, 1942. It consolidated in a single agency the nonfarm housing functions of the federal government. Policies were centred in the office of the administrator and operations were carried out through three major constituent units: the Federal Home Loan Bank administration, the Federal Housing administration and the Federal Public Housing authority.

With the end of World War II, the National Housing agency immediately directed its efforts to stimulating the largest possible volume of home construction and combating inflationary price trends resulting from the acute shortage of housing throughout the United States.

War-time controls on building were removed almost entirely through the rescinding of the War Production board's conservation order L-41 on Oct. 15, 1945. A substantial core of the home building industry had

been kept active during the war and as early as 1944 had been enabled to start constructing houses approximating peacetime standards through a transitional program to relieve congestion, authorized as the job of housing war workers drew near completion.

From the long-range point of view, the NHA estimated that the United States needed 12,500,000 new dwellings in the following ten years to meet the needs of returning veterans, new families and families who were living doubled up, and to replace one-half of the clearly substandard housing, assuming the full replacement job had to be spread over a 20-year period. The NHA reported that construction of 1,250,000 houses a year would mean an investment of \$6,000,000,000 to \$7,000,000,000 annually and would provide about 4,500,000 jobs, off and on the building site.

At the conclusion of its war job, the NHA had carried out a program to provide the necessary shelter at the right time and in the right places to meet the needs of about 4,000,000 migrating war workers and their families, an estimated 9,000,000 persons altogether.

Mobilization of existing housing under the leadership of the NHA and with the co-operation of local communities provided quarters for approximately 2,000,000 of these workers, 600,000 with families. Housing for the others had to be created by converting existing structures and by new buildings. This additional housing was programmed by the NHA and built in 1,300 localities scattered throughout the United States and its outlying territories. Private financing was called upon to build when it could meet the wartime needs and where there was reasonable assurance that there would be continued need for the housing after the war. Public financing was used to build the remainder. In all categories, private financing had supplied 1,051,549 dwelling units at an approximate cost of \$4,300,000,000, most of it covered by FHA war housing mortgage insurance, by Aug. 31, 1945. Public financing had supplied 832,241 units at a cost of \$2,600,000,000.

The war housing program ended Aug. 31, 1945, and on Oct. 15, 1945, the WPB order L-41, a war measure which restricted residential building to quotas established by the NHA, was lifted. The transition of housing from status as a war utility to a peacetime commodity was complete.

In preparation for this transition, as early as July 1944 the NHA, in co-operation with the WPB, expanded the single classification of war housing into three categories. The three were: H-1, housing for in-migrant war workers; H-2, housing to relieve congestion which impeded the war program; and H-3, housing to relieve individual hardships and for veterans. H-1 and H-2 housing were programmed by the NHA, H-3 was authorized on an individual basis as needed. H-2 could be expanded as rapidly as materials and manpower permitted and was the instrument which permitted the housing industry to continue to function as the H-1 program neared completion. As of Aug. 31, 1945, the war housing program was as shown in Table I.

Table I.—Final War Housing Figures, July 1940-Aug. 31, 1945

	Completed	Under construction	To be started*
<b>H-1: Housing for in-migrant war workers</b>			
Privately financed . . . . .	1,009,001	26,487	20,702
New permanent units . . . . .	810,711	25,671	18,580
Converted units . . . . .	198,290	816	2,122
Publicly financed . . . . .	832,241	22,004	4,978
New permanent dwellings . . . . .	192,093	2,754	1,102
Demountable family dwellings . . . . .	81,116	81	0
Temporary family dwellings . . . . .	261,902	15,927	947
Converted family dwellings . . . . .	49,370	6	427
Dormitory units . . . . .	168,367	1,493	890
Stoppag . . . . .	79,393	1,743	1,612
Total H-1 private and public . . . . .	1,841,242	48,491	25,680
<b>H-2: Housing to relieve general congestion</b>			
Privately financed dwellings . . . . .	1,571	23,526	78,159
Publicly financed dwellings . . . . .	0	44	4,395
Total H-2 private and public . . . . .	1,571	23,570	82,554
<b>H-3:† Housing to relieve individual hardship (all private)</b>			
New construction . . . . .	12,900	41,800	16,746
Conversion units . . . . .	28,077	8,452	0
Total H-3 . . . . .	40,977	50,252	16,746
<b>Grand total—All</b>			
War housing: H-1, H-2, H-3 . . . . .	1,883,790	122,323	124,980

\*"to be started" is housing which was approved as of V-J day; publicly financed housing in this category was terminated and privately financed quotas which had not been taken by builders were withdrawn. Publicly financed war housing under construction was terminated where it was in the public interest.

†Approximately 16,000 veterans who wished to build their own homes had H-3 priorities as of Aug. 31.

(J. B. BL.)

**Federal Housing Administration.**—The FHA does not itself make loans but insures private lending institutions against loss on residential loans meeting FHA standards.

The FHA revolutionized methods and procedures in home financing. In place of relatively short-term first, second and third mortgages with their high interest rates and renewal fees, it popularized the single, long-term amortizing mortgage bearing a low fixed interest rate. The maximum FHA interest rate in 1945 was 4½% plus the FHA insurance premium of ½ of 1%, both calculated on annual outstanding balances. The premium was deposited in the Mutual Mortgage Insurance fund.

FHA operations substantially improved the general quality of dwelling construction and of subdivision layouts. It set up nation-wide building, location and subdivision standards. To be eligible for FHA mortgage insurance, a home had to meet such requirements as accessibility to employment centres, to transportation, schools and shopping districts. As a result, residential neighbourhoods were established on a firmer basis.

Peacetime functions of the FHA are carried out under titles I and II of the National Housing act. Title VI was added as a war measure in March 1941 to help provide private housing, temporarily meeting emergency war housing needs but designed and built for permanence.

Title I provides for government insurance to lending institutions on loans for property improvement, alterations and repairs. Most of these

OLD HOUSES in Seattle, Wash., were moved by barge along Puget Sound in 1945 to relieve housing shortage in congested area

loans are limited to a maximum amount of \$2,500, a maximum term of three years and are repaid through monthly instalments. However, as part of the war program, congress authorized the FHA to increase from \$2,500 to \$5,000 the size of individual loans under this title, and with longer maturities, where operations would provide additional living accommodations for war workers through conversion of existing structures in areas specifically designated by the president. Under wartime conditions, many types of title I loans were subject to regulation W of the Federal Reserve board requiring shorter maturities than the maximum permitted by the National Housing act. This restriction was lifted in regard to property improvement loans in Oct. 1945, when wartime construction controls also were removed.

Title II provides for insurance of mortgage loans ranging up to \$16,000 made by approved private lending institutions, and for monthly amortization of the loan over periods as long as 20 years. Such loans may cover either new or existing housing, but generally may not exceed 80% of the property valuation. Where loans are for not more than \$5,400, however, and cover new single-family, owner-occupied homes built under FHA inspection, the mortgage may be made for 90% of the appraised value and may have an amortization period as long as 25 years. On new owner-occupied homes valued at not more than \$10,000, mortgages may cover 90% of the first \$6,000 of valuation and 80% of the remainder up to a maximum mortgage of \$8,600, with a maximum term of 20 years. Under title II, the FHA also provides mortgage insurance for large-scale rental projects.

Title VI was added to the National Housing act by congress in March 1941 specifically to assist in providing housing for war workers. Insurance activity under this title ended in Aug. 1945. Most of FHA's operations during the war period were conducted under this new title. Mortgages insured under it were limited to a maximum of \$5,400 on a single-family house; \$7,500 on a two-family house; \$9,500 on a three-family house; and \$12,000 on a four-family house, and could cover up to 90% of FHA valuation. Occupancy priority of these dwellings was reserved for eligible in-migrant war workers. Large-scale rental housing projects for war workers were also insured under title VI. Approximately 450,000 dwelling units for war workers were provided by mortgages insured under this title, for which the total insurance authorization provided by congress was \$1,800,000,000.

From the start of the national emergency in July 1940 up to the surrender of Japan, Aug. 1945, approximately 750,000 new privately financed dwelling units were started under all FHA titles.

The long-term program of the FHA enabled more than 1,600,000 families to build, purchase or refinance their homes, or to rent modern quarters. FHA insurance on residential mortgages, excluding title VI war housing, was at the end of 1945 more than \$5,133,000,000 and FHA repair loans under title I, exceeding more than 5,000,000 in number, aggregated \$1,903,733,000. As of Aug. 31, 1945, approximately \$2,090,689,150 of the mortgage loans and more than \$1,600,000,000 of the repair loans had been repaid through regular monthly payments or prepayments.

The FHA's credit experience under its mortgage insurance program was outstanding. Out of 1,112,005 small homes financed with mortgages insured under title II, only about 4,065, or one out of every 2,800, had been foreclosed and transferred to the FHA by Aug. 31, 1945. All but seven of these properties had been resold. From 1940, the FHA's income from its insurance premiums and investments was sufficient to meet all operating expenses and to add substantial amounts to insurance reserves.

In addition to being self-supporting, the FHA was able to declare two dividends under the participation provisions of the Mutual Mortgage Insurance fund on certain groups of mortgages. The first disbursement was made to approximately 13,000 mortgagors in 18 groups who prepaid their mortgages in 1944. As of Jan. 1, 1945, equity balances had accumulated in 14 additional groups; and this second dividend eventually was to be shared by nearly 142,000 mortgagors who remained in these groups on that date. Further dividends were to be declared for other groups as they were justified by the accumulated equity balances. (R. M. Fy.)

**Federal Home Loan Bank Administration.**—The Federal Home Loan Bank administration directs the operations of the Federal Home Loan Bank system and the Federal Savings and Loan Insurance corporation, two permanent agencies established to encourage home ownership and economical home financing and to protect savings. Also under the supervision of the administration is the Home Owners' Loan corporation, an emergency agency founded to aid distressed home owners and stabilize investments in residential real estate during the depression.

**Federal Home Loan Bank System.**—Following the national pattern set up for commercial banks in the earlier inauguration of the Federal Reserve system, 12 regional Federal Home Loan banks were organized, each to serve member home financing institutions in its area by making both short- and long-term advances to meet their needs. Through the regional banks funds might be shifted from areas of abundant credit to areas of scarcity. From the time the banks were established, they had advanced \$1,497,966,000 to their member institutions, of which \$112,450,000 was outstanding in 1945.

On Aug. 31, 1945, member institutions of the system totalled 3,699. Of these, 3,659 were savings and loan associations, co-operative banks and homestead associations, including 1,469 Federal Savings and Loan associations for whom membership was mandatory and 25 mutual savings banks and 15 insurance companies. Assets of member institutions amounted to \$8,087,000,000 on Aug. 31, 1945.

**Federal Savings and Loan Insurance Corporation.**—In 1934 congress provided an insurance program for investors in savings and loan associations and similar home financing institutions by creating the Federal Savings and Loan Insurance corporation. Federal Savings and Loan associations were required to be insured; insurance was optional for state chartered associations. The public confidence inspired by the fact that investments were so safeguarded provided a steady flow of funds into insured savings institutions. About 4,300,000 investors in 2,475 savings and loan associations, with combined assets of nearly \$5,700,000,000, were protected by insurance up to \$5,000 each in 1945.

**Home Owners' Loan Corporation.**—Over a period of three years following its creation in 1933, the Home Owners' Loan corporation refinanced the mortgages on more than 1,000,000 homes, providing low-interest, long-term loans which saved home owners many hundreds of millions of dollars and gave them a chance to rehabilitate themselves. In these rescue operations, approximately \$3,093,000,000 was loaned to home owners, an amount increased to \$3,490,000,000 by later advances to borrowers and other disbursements by the corporation.

More than 73% of this investment had been liquidated through collections on the corporation's loans and the sale of properties securing its loans which it was obliged to take over by foreclosure. From 1936 the primary functions of the HOLC had been its collections and the general liquidation of its assets, as well as aiding its borrowers to meet their payments and retain their homes. Although the agency was forced to acquire a total of 198,127 houses, all but 663 had been sold by Aug. 31, 1945.

On that date HOLC was collecting on 515,684 accounts, 391,732 those

of original borrowers and the rest purchasers of acquired properties. Borrowers, plus purchasers of HOLC houses, had paid off their accounts in full, to a total of 488,109. More than 84,000 borrowers were making monthly payments in amounts greater than called for by their contracts. (J. H. FA.)

**Federal Public Housing Authority.**—Toward the end of 1945, while legislation formulating a national housing policy was pending before the congress, the FPHA had four principal functions:

1. The management of public war housing during the period of reconversion and demobilization for distressed families of veterans and servicemen, for civilian employees of the war and navy departments and of private industries completing war contracts and for distressed families dislocated or displaced as a result of the war or demobilization.

2. The disposal of public housing determined to be surplus to the above needs.

3. The administration of the low-rent housing built before World War II, and the conversion of war housing under the U.S. Housing act to low-rent status.

4. The reactivation of deferred low-rent projects as building labour and materials became available.

Before the outbreak of war interrupted construction of low-rent housing under the U.S. Housing act, local housing authorities in 173 communities built 334 projects containing 105,600 units for low-income families formerly living in slum dwellings.

The total development cost of the prewar low-rent projects was \$483,000,000. Although the FPHA was authorized to lend up to 90% of the development costs, it actually supplied only two-thirds of the long-term financing, as a result of the ability of local housing authorities to sell bonds on the private market at an interest saving. All loans from the FPHA or private investors were to be repaid in full, with interest.

To help keep rents within the means of low-income families, the FPHA makes an annual contribution, or subsidy, which for 1944 totalled \$8,600,000, or \$7.19 per dwelling unit per month. To June 30, 1945, federal subsidy payments totalled \$43,409,000; this represented the entire cost to the federal government from the beginning of the low-rent program. In addition, the local community is required to make an annual contribution equivalent to at least one-fifth of the federal contribution. This is normally done by exempting the projects from state and local taxes, as authorized by the U.S. Housing act and state housing laws.

When World War II began, only half of the program authorized under the U.S. Housing act had been completed. Units under construction at that time were completed with the aid of priorities to house war workers, and were to be turned back to the use of low-income families as conditions would permit. Additional war housing projects were built under public law 671, which authorized the use of low-rent housing funds for war housing construction. Low-rent units scheduled in areas not requiring more war housing were deferred, pending availability of building labour and materials.

Table II.—Housing Built or Authorized Under U.S. Housing Act  
As of Aug. 31, 1945

	Projects	Dwelling units
Low-rent, prewar (public law 412) . . . . .	334	105,625
Low-rent for war use (public law 412) . . . . .	49	11,930
Low-rent funds used for war housing (public law 671) . . . . .	202	52,786
Deferred low-rent . . . . .	164	23,225
Total . . . . .	749	193,566

The major wartime function of FPHA was to provide publicly financed housing for in-migrant war workers and their families; the FPHA being responsible for the construction and management of about four-fifths of the total provided. The remainder was provided by other agencies, principally the war and navy departments and the U.S. maritime commission. For the total public war housing program, about \$2,600,000,000 was made available, all from congressional appropriations or loan authorizations except \$29,000,000 expended by the New York State Division of Housing.

From these funds some 864,000 accommodations were provided for families or single persons; in addition 32,000 had been scheduled but not completed by Aug. 31, 1945. The total included 610,000 family dwelling units, 171,000 dormitory units and 83,000 trailers, portable shelters and other forms of stop-gap housing. These figures included accommodations made available by re-use of trailers and temporary or demountable units which were moved from one location to another.

Not counting units that might be transferred to the FPHA by the National Housing agency or the Surplus Property administration, the FPHA had about 656,000 units, completed or under construction contract, to dispose of.

About 321,000 were temporary units, unsuitable for long-term use as housing. These had to be removed from their existing sites as promptly as the needs of demobilization would permit, and not later than two years after the end of the emergency. Such projects were to be sold to federal agencies, state and local governments and nonprofit institutions, or to private purchasers who would contract to remove the structures and restore the site.

About 181,000 units were permanent, including 107,000 of standard construction, and 74,000 demountables which might be dismantled and re-erected at new locations. These were to be sold to occupants or other private purchasers, unless sold or transferred to other federal agencies, or state and local governments. They might be sold to local housing authorities for low-rent use if officially requested by the community and approved by congress.

The 63,000 war housing family units, built by congressional authorization with U.S. Housing act low-rent funds, were to be turned to the use of low-income families.

The FPHA's stock of 35,000 trailers were to be disposed of by an appropriate agency designated by the Surplus Property administration.

About 56,000 units converted from existing structures, mostly under

seven-year lease from private owners, were to be returned, usually at the expiration of the lease term. (P. M. K.)

**Great Britain.**—The ending of World War II found Great Britain in 1945 with a housing problem no less formidable than any in its history. Practically no new houses had been built after the beginning of hostilities. On the other hand, millions of houses had been destroyed or damaged by enemy action. In addition there was all the accumulated wear and tear, and the fact that even before the war many slums remained to be cleared.

It was generally estimated that 4,000,000 new houses were urgently required for England and Wales, while no fewer than 500,000 were required for Scotland alone.

In the face of these formidable requirements, the attention of the government was first directed toward the provision of temporary houses, and at the request of the ministry of works many prototype temporary houses were devised by individual firms of contractors and architects. The first estimate of the cost of such houses was £600 per house. This proved to be completely fallacious. The cost worked out at £992 for the cheapest house and £1,365 for the dearest. The wartime coalition government had decided to build 165,000 temporary houses, and the Labour government decided to adhere to the same program, despite the fact that it meant an additional financial burden of £34,669,470, bringing the total cost up to £184,669,470. About 30,000 houses were expected from the United States on lend-lease terms, and it was anticipated that the cost falling on the British exchequer, including customs duty, would be £800 for each house. With the abrupt ending of lend-lease, however, it was apparent that the full cost of the house, amounting to £1,330, would fall upon the exchequer, and it was therefore decided not to take more than the 8,150 houses that had already been shipped.

In October Aneurin Bevan, minister of health, announced his new housing policy, which may be summarized as follows: (a) The first houses in the postwar program were to be built mainly by the local authorities and would be designed for the lower income groups. (b) In postwar housing, the creation of one-class communities, so conspicuous a feature of British suburban housing between the wars, was to be avoided. (c) There were to be more diversified designs. (d) Provision was to be made for all age groups, and there was to be no segregation of the very old. (e) Private building was to be licensed by the local authorities up to a limit of £1,200 in the provinces and £1,300 in London. (f) The resale of these houses would be prohibited for four years, when it was hoped that the main problem would have been solved. (g) Local authorities were to be enabled to borrow money at 3½% from the public works loan board. (h) Household with superfluous space were invited to share their homes with other families. Space would be requisitioned from those who did not volunteer if they had accommodation grossly in excess of their needs. (i) Local authorities might acquire land for housing at once. Negotiations with the landlords as to price would be carried out afterwards. Aneurin Bevan also promised to produce an improved act to provide houses for rural workers. He further undertook to use every method of house construction.

In Scotland, no fewer than 11,000 houses were under way by the end of 1945.

That it was the intention of the government to avoid many of the mistakes made in the interwar years was clear from a number of statements. The government accepted the decentralization proposals of the Barlow commission. It accepted also the compensation and betterment proposals of the Uthwatt committee, and legislation to give effect to these proposals would, it was announced, be introduced early in 1946.

The appointment of a new towns committee under the chairmanship of Lord Reith was announced by Lewis Silkin, minister of town and country planning. This committee would have the task of advising local authorities on the technical and administrative problems involved in the carrying out of a planned dispersal policy. This policy, which coupled the provision of housing with the provision of work plans, was brought into the forefront of practical politics by Sir Patrick Abercrombie's plan for the Greater London area. In this, Sir Patrick advocated the creation of ten new towns situated beyond the London green belt, in which to provide accommodation for about 600,000 people displaced in the effort to provide better housing accommodation for the inhabitants of the overcrowded London boroughs. The plan for Manchester, one of the best of the regional concepts, also provided for the decentralization of 150,000 persons from the built-up Manchester area.

It was already clear that the standard of permanent housing was to be higher than that provided between the wars. First, as regards space, the average new house was to be one of 900 sq.ft. floor area, plus an additional 90 sq.ft. in the form of an outbuilding for storage purposes and the practice of manual hobbies. Secondly, as regards equipment, up-to-date kitchen appliances and up-to-date bathrooms were to be provided. In many of the new houses the kitchen and bathroom would arrive at the site as a single prefabricated unit, the dividing wall being used as a compartment containing the plumbing and other pipes, which hitherto had formed a somewhat unsightly feature of lower-income group housing.

Of the many new types of houses, perhaps the most interesting from the point of view of design were those in steel and in aluminum. They showed the application of engineering technique and of materials hitherto not commonly employed in house construction in Britain. Both types of houses, while externally departing from tradition, would fit harmoniously into either an urban or a rural pattern. Internally, the houses showed possibilities of elegance, spaciousness and convenience previously associated only with the more expensive British homes.

**Hull, Cordell** (1871- ), U.S. statesman, was born Oct. 2 in Overton (now Pickett) county, Tenn. He was graduated from the Cumberland university law school in 1891 and served as a captain in the Spanish-American War. He served in congress from 1907 to 1933, except for one brief interval, 1921-23. He was elected to the senate in 1931 but resigned in 1933 to become President Roosevelt's secretary of state. Internationally, his name became closely associated with the "good neighbour" policy in South America and elsewhere; he was a consistent foe of aggression in settling disputes. In Aug. 1943, Hull accompanied President Roosevelt to Quebec, where he participated in the British-Canadian-American conferences. Two months later he travelled to Moscow to confer with Anthony Eden, British foreign secretary, and Vyacheslav Molotov, soviet foreign commissar. In June 1944, he attempted to allay the fears of small nations by declaring his belief in the principle of sovereign equality of all peace-loving states, regardless of size or strength, as partners in a future system of general security. In failing health, he resigned on Nov. 27 as secretary of state. Hull was awarded the Nobel peace prize for 1945, the Nobel prize committee announced in Oslo, Nov. 12. Testifying before the congressional committee investigating Pearl Harbor (Nov. 27), Hull angrily branded as an "infamous charge" the U.S. army's Pearl Harbor report that his ten-point proposal to Japan on Nov. 26, 1941, was an ultimatum that touched off the war. He had stated earlier that on Nov. 7, 1941, he warned President Roosevelt and the cabinet that the country should be alerted for an attack "anywhere by Japan at any time."

**Humbert** (1904- ), prince of Piedmont, was born Sept. 15, the son of Victor Emmanuel III. His education emphasized military arts and sciences and included a period at the Royal Military academy in Turin. He rose rapidly from the rank of lieutenant at 18 to colonel at 26. He was the object of an attempted assassination in Brussels in 1929 because of his alliance with Italian fascists. In 1930 Humbert married Princess Marie José, daughter of King Albert of Belgium. In 1940 he was placed in command of Italy's army of the Alps, with the rank of full general. On June 5, 1944, Humbert was designated lieutenant general of the realm when Victor Emmanuel signed over to him all his royal powers without exception, retaining for himself only the designation "king of Italy and head of the house of Savoy." The prince was backed by a political party drawn largely from aristocratic families and military and naval officers. During 1945, Humbert was not overly popular with the mass of the Italian people, and remained discreetly in the background of Italian politics.

**Hungary.** A kingdom in central Europe. As the result of territorial expansion from 1938 to 1941, the area of Hungary in 1942 was 66,409 sq.mi., with an estimated population of 14,733,000. As the result of the defeat in World War II, Hungary found itself in 1945 reduced to its size of 1938, an area of 35,911 sq.mi. Its population (Dec. 1936) was 8,989,000. The majority of the population are Roman Catholics, but there is a large Protestant, and there was a considerable Jewish, minority. Capital: Budapest. Chief cities (pop., 1939 census): Budapest (1,115,877); Szeged (141,254); Debrecen (128,442); Kecskemét (83,837). Though Hungary is officially a kingdom, the throne was vacant after 1918 and the royal functions were exercised by a regent, Nicholas Horthy

de Nagybánya. Prime minister (1945): Zoltan Tildy.

**History.**—With the advance of the Russian armies into Hungary a provisional national government was formed, with Russian agreement, in Debrecen on Dec. 22, 1944, under Colonel General Béla Miklós as prime minister. It consisted of military men and of representatives of the Communist, Social Democratic, National Peasant and Small Landowners parties. It promised the abolition of all anti-Jewish laws, the establishment of individual freedoms, respect for private property, and a thorough land reform which would transform the Hungarian peasantry into a landowning middle class.

On Jan. 20, 1945, the government concluded an armistice with Russia. It declared war on Germany and put its army under Russian command for the continuation of the war against the common enemy. Hungary had to pay reparations to the amount of \$300,000,000, of which two-thirds was to go to the soviet union and one-third to Czechoslovakia and Yugoslavia. The reparations were to be paid in commodities in the course of six years.

With the conquest of Budapest, which was badly damaged, the government moved to the capital city. Though the secretary general of the Communist party, Matthew Rakosi, who had lived many years in Russia, exercised a great influence, and though the country was occupied entirely by the Russian army, without any participation by the western Allies, Communist representation in the cabinet was weaker than in the other Russian controlled countries. Both the prime minister, and the minister of war, General Vörös, were men close to the old conservative regime but who had taken an anti-German stand in the last period of the war.

The soviet union tried to incorporate Hungary completely within the soviet economic system by a far-reaching economic treaty. As this treaty would have established for at least five years practically a Russian monopoly over Hungarian economic life by granting to Russia 50% of the share capital of all Hungarian enterprises, the United States government protested in a note to the Hungarian government against that arrange-

BUDAPEST'S FAMOUS chain bridge, submerged in the Danube where it collapsed under gunfire in 1945. The royal palace, in ruins, overlooks a river bank lined by skeletal buildings

ment which it regarded as contradicting the most-favoured-nation agreement of 1925 between Hungary and the U.S.

In October municipal elections were held in Budapest. Though the working class was best represented in this large city, the conservative Small Landowners party received an absolute majority as against the combined lists of the Communists and Social Democrats. In the new city council there are 122 members of the Small Landowners party, 104 Communists and Social Democrats and 15 members of smaller parties. Crowds shouting "Budapest will not be Red," surged through the city celebrating the victory. The chairman of the Small Landowners party, Zoltan Tildy, declared that "Hungary does not want to be in anybody's sphere of influence. We want to be independent, and we want to have all possible dealings with the western powers and at the same time remain on friendly terms with Russia."

The outcome of the Budapest election was confirmed in the national elections which were held in Hungary on Nov. 4, 1945. According to all reports the elections, in which for the first time women participated, were free elections. Thus they brought a sweeping victory for the Small Landowners party. Zoltan Tildy became prime minister. His cabinet included five members of the Small Landowners party, among them the ministers for foreign affairs, for the interior, and for war; 3 Social Democrats; 3 Communists; and 1 member of the Peasant party. The government faced a critical economic situation due to the damages of war, the lack of transportation and the heavy reparations payments which were absorbing almost the whole production of the country.

The peoples court began to deal with collaborators in November. Among the first tried and sentenced to death were the former prime ministers László de Bárdossy and Béla Imrédy.

**Education.**—Education is compulsory for children between 6 and 12, and for three more years they must attend continuation schools or courses, many of them specialized agricultural schools. Besides these continuation schools and a relatively large number of special schools, Hungary had, in 1939, 8,103 elementary schools with 23,215 teachers and 1,104,916 pupils. In the cities there existed 418 primary schools with 4,619 teachers and 105,466 pupils. High schools of different kinds numbered 263, with 4,709 teachers and 79,435 students. There were three universities, Budapest, Pécs (Fünfkirchen) and Debrecen.

**Finance.**—The monetary unit is the pengő, containing 0.263158 grams of fine gold, equal to 19.77 cents U.S. in March 1941. The revenue for 1943 was estimated at 4,047,000,000, the expenditure at 4,247,000,000 pengős. The public debt amounted on Sept. 30, 1942, to 4,869,000,000 pengős; bank notes in circulation on Sept. 30, 1942, to 2,470,000,000 pengős. As against this circulation, the national bank of Hungary had a metal reserve, including foreign exchange, of \$328,182,000.

**Trade and Communication.**—Hungary imported in 1941 goods valued at 730,000,000 pengős, and exported goods to a value of 791,000,000 pengős. Of the imports in 1939 almost half of the value came from Germany and half the exports went there; Italy held second, and Great Britain third place. In 1939 Hungary had 6,307 mi. of railroad, 2,898 post offices, 6,902 mi. of telegraph lines and 20,976 mi. of telephone lines.

**Agriculture, Manufacturing, Mineral Production.**—Hungary's main production is agriculture. In the fertile plains of the Danubian basin, potatoes, maize, wheat, sugar beets, rye, barley and grapes are grown. Hungary is rich in forests, pigs and cattle. It has a wealth of good coal and important bauxite deposits. Most of the industry is connected with agriculture. Hungary produced, in 1939, 11,712,436 short tons of coal, 551,363 short tons of bauxite, 451,163 short tons of pig iron and

807,562 short tons of steel. The most important of Hungary's minerals is the bauxite. Hungary's deposits are estimated at 250,000,000 tons, a quarter of the world's deposits. The annual output of a little more than 500,000 tons before World War II represented about 15% of the world's yearly output. (See also RUMANIA; WORLD WAR II.)

**Hurdling:** see TRACK AND FIELD SPORTS.

**Hurley, Patrick Jay** (1883— ), U.S. diplomat, army officer and lawyer, was born Jan. 8 in the Choctaw nation, Indian territory (later the state of Oklahoma). He took his law degree from the National University Law school in Washington (1908). He served in World War I, reaching the grade of lieutenant colonel, and was secretary of war, Dec. 1929–March 1933. A month after the Pearl Harbor incident, he was promoted to brigadier general and was assigned to the far eastern theatre of operations. He was Pres. Roosevelt's special representative to the soviet union (Nov.–Dec. 1942) and later was named special representative to the near and middle east (March 1943). Hurley was made a major general in Dec. 1943, and was appointed ambassador to China on Nov. 27, 1944. He sided with the Chungking government in its factional struggle with the Chinese communists, declaring (April 2, 1945) that the U.S. was pledged to give economic, political and military aid to the Chungking government, but that extension of similar assistance to the Chinese communists was not in line with U.S. policy. Hurley's efforts to bring the two regimes together were not successful, and in announcing his resignation (Nov. 27), he accused "professional diplomats" in the state department of sabotaging U.S. foreign policy in China. A subsequent investigation of Hurley's charges by the senate foreign affairs committee was dropped Dec. 11. No conclusions or recommendations were made.

**Hutchins, Robert Maynard** (1899— ), U.S. educator, was born Jan. 17 in Brooklyn, N.Y. His father, William James Hutchins (1871— ), minister and theologian, was subsequently president of Berea college, in Kentucky. Hutchins left Oberlin college in 1917 to enlist in the U.S. ambulance corps, winning the Croce di Guerra in action with the Italian army. Entering Yale in 1919, he received his A.B. in 1921, received his LL.B. (*magna cum laude*) in 1925, and later received honorary degrees from many colleges and universities. In 1923, at the age of 23, he was appointed secretary of Yale university, and at 27 was dean of the Yale law school. In 1929, at the age of 30, he became the fifth president of the University of Chicago, where his reforms and proposals for reform made him one of the best known and most controversial figures in the world of education.

In 1945, at 46, he was one of the oldest U.S. university heads in point of service. He completed his 16th year at Chicago with the achievement of one of his sweeping reforms and the proposal of another. The achievement: a four-year college program beginning with what is ordinarily the third year of high school. The proposal: that the University of Chicago ultimately do away with faculty rank, place all members of the faculty on full-time service (a large proportion of the faculty at once asked for and received full-time contracts) and "lead a moral, spiritual and intellectual revolution throughout the world."

When, with the defeat of Japan in 1945, it was revealed that the University of Chicago, under Hutchins' administration, played a major role in constructing the atom bomb, Hutchins declared in a radio broadcast that "with the dropping of the

bomb, the United States lost its moral prestige." At the same time, though he opposed the entrance of the U.S. into the war prior to Pearl Harbor, he called for immediate world organization and the abandonment of national sovereignty as the only protection against the atomic destruction of civilization. In order to devote more time to teaching, writing and speaking, he resigned as president of Chicago, taking the newly created office of chancellor.

In speeches, in books and in teaching undergraduates (which he continued to do throughout his career), and in administrative acts and proposals, Hutchins fought for a program of general liberal education for every child, regardless of the individual's financial capability.

In addition to papers in learned journals, he wrote many articles in popular and educational periodicals, and is the author of three books—*No Friendly Voice* (1936), *The Higher Learning in America* (1936) and *Education for Freedom* (1943).

**Ice Cream.** Production of ice cream in the United States declined about 8% in the first half of 1945 compared with the same period in 1944. Estimates for the entire year would not be available until March 1946. Total production in 1944 was estimated at 446,889,000 gal. which was 8% above the 412,144,000 gal. produced in 1943 and 27% larger than the average of 262,060,000 gal. produced in the prewar period 1935-39. Ice cream manufacturers were permitted to increase the use of butterfat from 65% to 75% of the base period (Dec. 1941-Nov. 1942) in June, and other restrictions were relaxed on Sept. 1 so that production could be expanded as much as the shortage of sugar would permit. Civilian consumption was slightly lower during the first half of 1945 compared with the 15 lb. per capita used in 1944, 12.6 lb. in 1943 and 15.9 lb. in 1942. The prewar average was about 10 lb. per capita. Supplies for civilians were far short of demand in 1945 and distribution was rationed by distributors to allotments about the same as in 1944. The demand was attributed to the large number of persons employed in factories serving lunches and to the congested living conditions that increased the use of prepared foods. Consumption by the army and navy was at a higher rate per capita than that of civilians, but began to decline as the forces were demobilized. The scarcity of butter and cheese was likely to compete with ice cream for cream for some time until the stocks of the former were brought back to normal size. (J. C. Ms.)

**Ice Hockey.** Les Canadiens of Montreal continued to dominate the National Hockey league through the 1944-45 season to win their second straight league championship, but relinquished the Stanley cup to Toronto in the playoffs. After finishing third in the league standings, Toronto upset the Canadiens with four victories in the six-match playoff and went on to defeat Detroit, Mich., in the final series. The Stanley cup windup went the maximum seven games, with Toronto winning the deciding contest, 2-1.

Montreal's dominance of the regular season was highlighted by the offensive feats of its No. 1 line—Maurice Richard, Elmer Lach and Toe Blake. Richard broke a 27-year-old league record in scoring 50 goals, wiping out the mark of 44 made by Joe Malone of the Quebec Bulldogs in 1917-18. Lach contributed 54 assists to the Canadian attack, breaking the record established by Clint Smith, Chicago, Ill., in 1943-44. As a unit, the Richard-Blake-Lach line broke the season record for total points with 220, including 105 goals and 115 assists. The Chicago trio of Smith, Doug Bentley and Bill Mosienko previously

held the mark at 219.

During 1944-45 each of the six towns in the National Hockey league topped its attendance of the year before. Although it failed to reach the playoffs, Chicago again led the league in attendance with a total of 348,821 in 25 home games.

Minor League hockey held on strongly during 1944-45 and started an expansion program in 1945-46 with the addition of the United States league. The Cleveland Barons won the American league championship for 1944-45, first capturing the western division title and then defeating Buffalo and Hershey, Pa., in the playoffs. Buffalo, the defending champion, dropped four out of six games to Cleveland in the semifinals and Hershey bowed to the Barons by a similar margin in the finals. The U.S. league revived the sport in the midwest with teams in Minneapolis, Minn.; Dallas, Tex.; St. Paul, Minn.; Kansas City, Mo.; Fort Worth, Tex.; Omaha, Neb.; and Tulsa, Okla.

The Seattle Ironmen won the United States amateur championship in the finals with the Boston Olympics, four games to two. Seattle won the Pacific Coast league title, while Boston dominated the Eastern league.

Montreal captured half of the individual trophies and won five out of six positions on the National Hockey league managers' all-star team. Lach won the Dr. David A. Hart trophy as the league's most valuable player, and William Durnan won the George Vezina trophy as the outstanding goalie. The Lady Byng trophy, awarded to the league's "most gentlemanly" player, went to Chicago's Mosienko. Frank McCool, Toronto goalie, was named outstanding rookie of the year. Aside from its forward line of Lach, Richard and Blake, Montreal placed Durnan and defenseman "Butch" Bouchard on the all-star team. "Flash" Hollett of Detroit was awarded the other defense position. (M. P. W.)

**Iceland.** An island republic of the North Atlantic. Area, 39,709 sq.mi.; pop. (est. 1939) 120,264. Capital, Reykjavik, the only large town (pop. in 1939, 38,219). Religion, Lutheran Christian. President: Sveinn Björnsson. Prime minister of the coalition government (Oct. 21, 1944), Olafur Thors, with a six-man cabinet—two each from Conservative, Social-Democratic and Communist parties.

**History.**—On June 17, 1944, Iceland became an independent state, following an overwhelmingly favourable vote in a national plebiscite. The president, given a term of one year in 1944, was chosen for a full term of four years more (to June 17, 1949), by agreement of all parties, without a popular election. Like the older states of the world, Iceland had difficult problems with which to grapple in 1945. One was the requirement that it declare war on Germany if it wished to participate in the San Francisco conference for framing the United Nations organization. This Iceland decided not to do because of its desire to maintain its permanent neutrality declaration of 1918. Transportation problems were severe, especially after the sinking of the "Dettifoss" in February left the country with no passenger ships plying the route to the United States. The U.S. air transport command helped temporarily to relieve the difficulty, agreeing to carry 20 passengers a month from the United States to Iceland.

Relations between the United States and Iceland entered a new phase with the end of World War II. Relaxation of the policy of segregating the army from the civilian population resulted in much pleasanter relations, and the occupying army was soon reduced to a token force. During the years of occupation several dozen marriages took place and during the summer of 1945 many Icelandic brides went to the U.S. On the original entry into Iceland the U.S. government had promised to withdraw its forces as soon as the emergency was over. The events of the war and the development of air transport heightened the strategic importance of the North Atlantic island, and obviously made the great neighbour to the west reluctant to leave.

The year 1945 also saw completion of the project of heating the city of Reykjavik by piping in water from the nearby warm springs, a particularly valuable achievement because of the lack of combustible fuel in Iceland.

**Finance.**—Monetary unit: króna = 18 U.S. cents (1939), about 15.37 U.S. cents in 1942; in 1939 government revenues were 19,930,879 krónur (estimated for 1943 at 33,736,100 kr.); expenditures, 19,378,318 kr. (estimated for 1943 at 28,333,238 kr.); national debt (1939), 56,648,000 kr.; notes in circulation, 14,000,000 kr.; gold reserve, 5,762,000 kr.; bank capital and reserves, 17,577,000 kr.; bank deposits, 76,720,000 kr.; total bank funds, 48,997,000 kr. Bank deposits were 452,421,000 kr. in July 1943. Note circulation jumped from 24,580,000 kr. in Jan. 1941 to

Economic Geography, Vol. 21, p. 142, April 1945.

\*Verzlunarskýrslur Árid 1942. †856.

123,810,000 kr. in Aug. 1943; loans in the same period, from 92,137,000 kr. to 170,594,000 kr. Gold reserves and bank capital remained practically at the 1939 figures.

Trade.—Exports in 1939 (the latest year of even seminormalcy) totalled 70,536,000 kr.; chief articles of export were fish and fish products. Imports in 1939 totalled 64,163,000 kr. The chief imports were gasoline, textiles, metal wares, wood and machines. Of Iceland's exports in 1939 Great Britain took 12,269,000 kr., followed by Sweden with 8,735,000 kr., the U.S. with 7,747,000 kr., Norway with 7,670,000 kr., Germany with 7,608,000 kr. and Denmark with 6,674,000 kr. Great Britain was first also in supplying Iceland imports, with goods valued at 15,604,000 kr. Denmark was second with 14,003,000 kr., Germany was third with 10,413,000 kr. and the U.S. was far down the list with 2,316,000 kr.

The years from 1941 showed significant contrasts with the peacetime balance depicted in the above paragraph. Exports rose steeply in value: 188,629,000 kr. in 1941, about 2½ times the value of 1939; and in 1944 the figure climbed to 254,000,000 kr., of which 228,000,000 kr. went to Great Britain. In 1941 a large credit balance was allowed to accumulate, but in 1942 Iceland imported more than it exported and continued to do so in 1943; in 1944 it again had a "favourable balance" of about 6,000,000 kr. Iceland sold its fish to Great Britain, with frozen fish beginning to displace salted fish, bought chiefly from the U.S. during World War II (164,800,000 kr. in 1944 out of total imports of 247,600,000 kr.). A postwar reorientation of trade came to be regarded as inevitable, with the Russian market as a significant hope. Capital was being husbanded and managed to aid in improving and balancing the economic structure.

Communication.—Highways (1936) totalled 2,728 mi., of which 1,736 mi. were improved and 992 mi. were unimproved. Miles of telegraph lines (1939): 9,700. Military occupation led to unrevealed new construction.

Agriculture.—In 1938 the chief products, with their yields in short tons, were as follows: hay 296,545; potatoes 14,506; turnips 3,148.

BIBLIOGRAPHY.—W. R. Mead, "Renaissance of Iceland," *Economic Geography*, pp. 135-144 (April 1945). (F. D. S.)

**Ice Skating.** Gretchen Van Zandt Merrill, 19-year-old miss from Boston, Mass., captured her third straight national figure skating championship by winning the women's senior test over Janette Ahrens of St. Paul, Minn. It was the fifth national title for Miss Merrill. However, she was defeated in the North American championships by Barbara Ann Scott of the Minto Skating club, Ottawa, Canada, who also won the Canadian championship during 1945. Jean Pierre Brunet and Donna Jean Pospisil of New York won the national pairs and Robert Swenning and Mrs. K. M. Williams, also of New York, won the national dance. The national fours, revived for the first time in several years, went to the Chicago quartet of Misses Jackie Dunn and Joan Yocum and Lawrence and Edward Vanderbosch. With most of the contestants in the armed service, competition in the men's figure skating events was again by-passed.

Herman Van Putten of Paterson, N.J., dominated men's

"JUNIOR PAIRS" champions, Lieut. Com. Lyman Wakefield and Betty Higgins, at the North American Figure Skating contest held at Madison Square Garden, New York city, on March 5, 1945

speed skating in the east with victories in the middle Atlantic and New York state meets. Marion Hanley, Staten Island, N.Y., war worker, topped senior women in the east's two major tournaments. Ray Blum of Nutley, N.J., who in 1944 won the Middle Atlantic and Silver Skates titles, dominated men's skating in the middle west.

Stationed at Chicago in the navy radio school, Seaman 2/c Blum won the majority of midwestern championships, with Mrs. Elaine Bogda Gordon continuing her dominance in the women's division. (M. P. W.)

**Ickes, Harold L.** (1874- ), U.S. secretary of the interior, was born March 15 at Frankstown Township, Pa. For his earlier career see *Encyclopædia Britannica*. President Franklin D. Roosevelt, after assuming office in 1933, selected Ickes as his secretary of the interior. In July of the same year, he appointed him head of the Public Works administration. Ickes also held a multitude of other posts. He became solid fuels administrator in Nov. 1941 and coal mines administrator in 1943, and was petroleum administrator for war (Dec. 1942-Nov. 1945). In Feb. 1944 he proposed that the U.S. government build an oil pipeline across Arabia at an estimated cost of between \$130,000,000 and \$165,000,000. This project aroused the ire of many U.S. oil companies and the plan eventually fell through. Ickes declared (Nov. 3, 1945), that the future of the U.S. as a great power might depend on the development of the great petroleum reserve in the federal government's newly claimed oil resources in the sea bed of the continental shelf.

In the fall of 1945, Ickes travelled to London where he signed the revised Anglo-American oil pact (Sept. 24). This agreement was expected to provide the basis of multilateral arrangements with other nations.

**Idaho.** One of the far northwestern states of the U.S. belonging to the group regionally designated as the Pacific northwest, Idaho was admitted as a territory in 1863 and as a state on July 3, 1890; is popularly known as the "Gem state." Area, 83,557 sq.mi., pop. (1940) 524,873, of which 66.3% was rural, 33.7% urban. On July 1, 1944, the bureau of the census estimated the civilian pop. of Idaho at 531,573. There were 3,537 Indians in the state in 1940. Principal cities

ARNOLD WILLIAMS, Democrat, succeeded to the governorship of Idaho on Nov. 11, 1945, when Charles C. Gossett resigned to accept an appointment to the U.S. senate

(1940) are Boise, the capital (26,130), Pocatello (18,133), Idaho Falls (15,024), Nampa (12,149) and Twin Falls (11,851).

**History.**—State officers for 1945 (all Dem.) were: governor, Charles C. Gossett; lieutenant governor, Arnold Williams; secretary of state, Ira H. Masters; attorney general, Frank Langley; auditor, Earnest G. Hansen; superintendent of public instruction, Grover C. Sullivan; mine inspector, Arthur Campbell; treasurer, Ruth Moon. The legislature elected in 1944 convened in Jan. 1945 with a slight Republi-

can majority. Most of its measures dealt with questions of post-war planning. The following were elected to U.S. congress: Senator John Thomas (R) who filled out Senator William E. Borah's unexpired term; Senator Glen Taylor (D); Representatives Compton I. White (D) and Henry M. Dworshak (R). On Nov. 10, 1945, Senator Thomas passed away whereupon Governor Gossett resigned, automatically placing Lieutenant Governor Williams in office. He immediately appointed Gossett to the U.S. senate to fill the vacancy caused by the death of Senator Thomas.

**Education.**—The school population in 1944-45 remained practically the same as the previous year—118,000. There were approximately 80,572 pupils and 3,802 teachers in 1,005 elementary schools. High school enrolment was 28,007 pupils with 1,326 teachers in 176 high schools. Enrolment in the higher branches showed a tremendous increase at midyear (Jan. 1946) because of great numbers of discharged servicemen and women re-entering, and many schools were faced with the serious problem of providing adequate school room and teachers.

The 1945 legislature appropriated \$50,000 for a state-wide survey of the educational situation with a view toward consolidation of various districts.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—There were two institutions for the insane, one at Blackfoot and one at Orofino, also a home for the feeble-minded at Nampa. There was a school for the deaf and blind at Gooding. The penitentiary at Boise had about 240 inmates at the close of 1945; it has a capacity of about 400. The reform school, known as the state industrial school, is located at St. Anthony and has a fairly constant population of 250.

**Communication.**—There were 4,910 mi. of state highway and approximately 33,000 mi. of county and forest roads in 1945; there was practically no construction during World War II other than military roads. The state had about 3,000 mi. of

railroad. Because of increased air transportation, many municipal airports were under construction in 1945. Telephone companies owned about 160,000 mi. of wire with an estimated 85,000 instruments in use. Telegraph mileage was approximately 9,000 mi.

**Banking and Finance.**—On Dec. 31, 1945, there were 33 state banks and 54 national banks with a combined capital of \$6,160,000 and surplus of \$4,708,000; deposits for 1945 were \$168,672,000. The assessed valuation of the state in 1945 was \$420,991,154; treasurer's receipts, \$41,363,892; and disbursements \$37,904,332, which included the payment of bonded indebtedness of \$1,390,600. Idaho for the first time in its history had no bonded debt.

**Agriculture.**—The total value of all farm crops in 1945 was approximately \$141,000,000 (besides \$109,000,000 in livestock and produce), distributed as follows: field and fruit crops \$128,000,000; and government payments \$13,000,000. (Sugar beets not included.)

#### Principal Agricultural Products of Idaho, 1945 and 1944

Crop	1945	1944
Wheat, bu. . . . .	30,696,000	30,309,000
Corn, bu. . . . .	1,334,000	1,581,000
Oats, bu. . . . .	6,806,000	7,308,000
Barley, bu. . . . .	11,840,000	12,728,000
Sugar beets, short tons . . . . .	800,000	629,000
Dry beans, cwt. . . . .	1,726,000	2,088,000
Dry peas, bu. . . . .	1,760,000	2,672,000
Hay (tame), tons . . . . .	2,103,000	2,148,000
Potatoes, bu. . . . .	44,220,000	36,675,000

**Manufacturing.**—Most of the state's manufacturing activities were in a state of reconversion during 1945, and no accurate figures were available.

**Mineral Production.**—The principal mineral products of the state were gold, silver, copper, lead and zinc. There were no statistics on 1945 output at the close of the year, but it was estimated that zinc and lead productions were the heaviest throughout the war.

A great deal of Idaho tungsten also contributed to the war effort. (L. Md.)

**Illinois.** A north central state of the United States, admitted to the union in 1818, nicknamed the "Sucker state," sometimes called the "Prairie state." Total area 56,400 sq.mi., of which 55,947 sq.mi. are land. Pop. (1940) 7,897,241, including 3,957,149 males and 3,940,092 females; 7,504,202 white, 393,039 nonwhite. Population classed as urban was 5,809,650, rural not on farms 1,119,488, rural farm 968,103. Springfield, the state capital, with a population of 75,503, is the fifth Illinois city in size. Chicago (3,396,808) is the largest Illinois city, followed by Peoria (105,087); Rockford (84,637); East St. Louis (75,609).

On July 1, 1944, the bureau of the census estimated the civilian pop. of Illinois at 7,729,720.

**History.**—The return of Illinois veterans to their homes and the reconversion of industries from war work were the features of Illinois history in 1945. At the close of the year approximately one-third of the state's 890,000 men and 70,000 women in the armed services had been discharged. Re-employment was more rapid than had been expected. In the first 11 months of the year, 400,000 persons were placed in jobs by the U.S. employment service, including 46,646 veterans of whom 4,141 were severely handicapped.

Dwight H. Green (Rep.) was governor of Illinois in 1945; Edward J. Barrett (Dem.) was secretary of state. Other incumbent state officers, all Republicans, were Hugh W. Cross, lieutenant governor; Arthur C. Lueder, state auditor; George F. Barrett, attorney-general; Conrad F. Becker, state treasurer; Vernon L. Nickell, state superintendent of education.

**Education.**—Latest available figures in 1945 showed 1,160,956 pupils

enrolled in 11,977 elementary school districts, with 33,853 teachers. But the number of small school districts was being rapidly reduced as the result of consolidations of districts forced by the enactment in 1945 of a law providing for minimum teachers' salaries of \$100 per month. Enrollment in 929 high schools included 343,332 pupils with 10,441 teachers. Five state teachers' colleges had 545 teachers and 5,061 students. Total expenditures on schools were \$204,754,288. State contributions to local school funds were \$11,161,202; to the University of Illinois, Urbana, \$16,566,841.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Almost one-half of the cost of the state government was composed of relief expenditures. For the fiscal year ended June 30, 1944, the state spent \$53,347,070 for old age pensions; welfare institutions, \$27,759,273; aid to dependent children, \$10,078,380; direct relief, \$9,224,706; blind pensions, \$2,033,623. The total population of all state institutions was 42,000 in 1945.

The state unemployment compensation fund paid \$33,146,559 to 222,083 persons in 1945. After Oct. 6 there was a gradual tapering off in claims filed; from 127,000 in October to 95,000 at the end of the year. The total number employed in Dec. 1945 was 3,250,000.

An Illinois postwar planning commission was organized Sept. 1, 1945, to direct the expenditure of \$101,000,000 for public works authorized by the legislature. Work was begun on the repair and rehabilitation of state welfare institutions at a cost of \$3,500,000. The legislature appropriated \$10,000,000 for slum clearance and public housing with the understanding that the sum would be matched by the city of Chicago.

**Communications.**—Before World War II halted highway construction, Illinois had 13,683 mi. of high-type paved highways connecting with approximately 75,000 mi. of township roads, lanes, etc., of which 50,000 mi. were unsurfaced. Highway expenditures by the state government for the fiscal year ending June 30, 1944, were \$49,103,683. The construction of paved farm to highway roads, authorized by the legislature, was started in 1945 with an initial outlay of \$10,000,000. The state also made a contract with Chicago and Cook county for a superhighway to be jointly financed by the three governments, each paying one-third—\$15,000,000.

Illinois railway mileage approximated 11,000 mi. Eighty per cent of Illinois communities had rail service.

**Banking and Finance.**—The Illinois banking system comprised on June 30, 1943, 813 banks, of which 340 were national; 120 state banks were members of the federal reserve system; 353 state banks were nonmembers. The growth of deposits and holdings of government bonds was so rapid that the bank call at the end of 1945 disclosed that deposits of Chicago banks alone had increased to a greater total than those of the entire state on June 30, 1943.

Total appropriations of the legislature in 1945 for the two-year period ending June 30, 1947, were \$773,000,000, a sum greater by \$256,000,000 than all appropriations for the two-year period ending June 30, 1945. The state treasury surplus resulting from unexpectedly high sales tax collections reached \$135,788,997 on June 5, 1945. Of this surplus \$101,000,000 was earmarked for postwar public works. Balances in regular state funds amounted to \$222,393,366 on June 5. Trust funds on that date totalled \$307,017,729, a large part of which was in the state unemployment compensation fund, which was subject to heavier drafts and smaller contributions after V-J day. The state debt was \$115,000,000 in the form of noncallable bonds maturing in 1954 and 1959.

**Agriculture.**—Illinois farmers produced crops valued at \$817,000,000 in 1945—the highest in 26 years. Harvested acreage was slightly less than in 1944.

Table I.—Leading Agricultural Products of Illinois, 1945 and 1944

Crop	1945	1944
Corn, bu. . . . .	391,000,000	403,695,000
Soybeans, bu. . . . .	74,000,000	71,400,000
Oats, bu. . . . .	158,102,000	101,984,000
Wheat, bu. . . . .	25,000,000	24,632,000

**Manufacturing.**—The value of products manufactured in Illinois in 1939, according to the U.S. biennial census (last before World War II), was \$4,794,860,733; the number employed was 688,800; total wages and salaries were \$988,453,881. The principal industries and the value of their products were as follows: meat packing \$479,501,224; steelworks and rolling mills \$207,301,815; petroleum refining \$122,933,528; tractors \$121,550,621.

**Mineral Production.**—Coal production in Illinois in 1945 was handicapped by lack of manpower and the greater age of miners who remained in the coal fields after the younger men were inducted into the army and navy. Although irregular from month to month, the output for the year was estimated at 69,500,000 net tons, compared with 73,492,000 net tons produced in 1944.

Illinois oil exploration continued to discover new pools in 1945. The average initial production of new wells was 141 bbl. per day. The daily

Table II.—Production of Coal and Petroleum in Illinois, 1944, 1943 and 1942

	1944	1943	1942
Bituminous coal, net tons . . . . .	73,492,000	72,430,000	65,071,000
Petroleum, bbl. . . . .	76,987,000	77,637,000	106,590,000

average production climbed to 202,000 bbl. per day in June 1945. Total oil production in Illinois in 1945 was expected to show a drop.

The total value of minerals produced in Illinois in 1943 was \$332,186,464.

(L. H. L.)

**Illinois, University of.** In 1945 George Dinsmore Stoddard, commissioner of education of the state of New York and president of the University of the State of New York, was named to become president of the University of Illinois on July 1, 1946, when Arthur Cutts Willard, president from 1934, would reach the mandatory retirement age.

Building plans totalling \$16,809,000 for 1945-47 were announced as the beginning of a ten-year program to meet accumulated needs. The university plant value in 1945 reached \$47,061,393.

The 762-ac. airport was dedicated as a centre for aeronautics education and research, commercial service, private flying and military training. Three new educational programs in aeronautics were established: flight training; aviation technician training at trade school level; and courses in aeroplane mechanics for prospective high school teachers of industrial education.

Included in plans for new buildings and equipment was a betatron to generate more than 250,000,000 electron volts energy and expected to produce cosmic ray effects in the laboratory. For his invention of the betatron in 1940, Prof. Donald W. Kerst of the university's physics department received the Cyrus B. Comstock prize of the National Academy of Sciences, voted him in 1943 but delayed in presentation by war secrecy of everything involving nuclear physics.

The dean for a new college of veterinary medicine and surgery was appointed. An allergy unit was established in the college of medicine to provide wide-scale training and research in this field. Special refresher short courses in medicine and pharmacy were instituted for veterans. The graduate school was provided with a "distinguished professorship fund" and several noted scholars were appointed under it.

Fall enrolment of 1945 included 1,500 war veterans. Their numbers were expected to increase greatly in succeeding terms. Total enrolment in the university was estimated to reach 18,000 by 1950. (For statistics of enrolment, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

**Illumination:** see ELECTRICAL INDUSTRIES.

**I.L.O.:** see INTERNATIONAL LABOUR ORGANIZATION.

**Immigration and Emigration, U.S.** The migration of aliens to and from the United States is regulated by law and treaty, and is under the jurisdiction of the commissioner of the immigration and naturalization of the department of justice. The principal immigration acts are the act of Feb. 5, 1917, which sets certain mental, physical, moral and economic standards; and the Quota act of May 26, 1924, which limits the number that may enter for permanent residence from certain countries.

Arrivals during the fiscal year ended June 30, 1945, were as reported in the table.

Number of Citizen and Alien Arrivals Examined During Fiscal Year Ended June 30, 1945

	Total	Alien	Citizen
Total . . . . .	57,775,089	28,305,803	29,469,286
Arrived at land borders . . . . .	55,801,140	27,395,495	28,405,645
Canadian . . . . .	23,515,596	10,482,226	13,033,370
Mexican . . . . .	32,285,544	16,913,269	15,372,275
Arrived at seaports . . . . .	310,113	141,387	168,726
Crewmen . . . . .	1,663,836	768,921	894,915

Of the total number, 97% were persons who crossed and recrossed the land borders. Alien admissions for permanent residence numbered 38,119 of which 26,496 were nonquota and 11,623 were quota immigrants; only 7.5% of the permissible quota of 153,879 was filled. The most recent quota allotment, that of 105 persons of the Chinese race, authorized by the act

of Dec. 17, 1943, was the only quota completely filled. Immigration for permanent residence exceeded emigration by 30,677. Immigration officers boarded and inspected 76,946 vessels, 44,389 planes, and in so doing examined 768,921 alien and 894,915 citizen crewmen.

The continued manpower shortage led to the extension of regulations and agreements reached with nearby countries regarding the importation of alien labourers. After 1942, when the first agreements were made, there were 354,896 labourers temporarily admitted to the United States, chiefly from Mexico and the West Indies. Most of these persons were repatriated. On June 30, 1945, there remained in the United States 99,434 agricultural labourers, 64,990 railroad track workers and 17,333 others employed in industries and services essential to the war effort.

During the fiscal year 1945, 2,341 aliens seeking admission for 30 days or longer, and 1,901 aliens applying for entry for less than 30 days were denied admission to the United States; 11,270 aliens were deported from the United States, 69,490 aliens who had been adjudged deportable were allowed to depart at their own expense without warrants of deportation, and 12 indigent aliens were returned to their own countries at the expense of the government.

The immigration border patrol patrolled 8,863,416 mi., examined 1,254,533 conveyances and questioned 4,161,573 persons, which resulted in the apprehension of 69,164 persons and the seizure of 100 conveyances. (See also ALIENS; CENSUS DATA, 1945; REFUGEES.) (U. C.)

**Income and Product, U.S.** The ending of World War II in Aug. 1945 resulted in an abrupt change in the wartime expansion of the national income and national product of the United States. The preliminary estimate of the national income for 1945 was \$160,000,000,000 compared with the 1944 total of \$160,700,000,000. The gross national product for 1945 was estimated at \$196,200,000,000 in comparison with \$197,600,000,000 for the previous year. The comparatively small decline in these aggregates for the year as a whole tended to minimize the change in the economic situation brought about by the end of the war. As a matter of fact, the level of national income and national product during the first eight months of 1945 was slightly higher than that prevailing in 1944. But during the latter months of the year, the stoppage of war production on a wide scale initiated a downward trend in the flow of both national income and product which reduced the totals for the year below those of 1944.

**Meaning of National Income and Gross National Product.**—National income as understood in this survey represents a summation of the net earnings of the various factors of production derived from their association in current economic production. Both money income and income in kind are included, so long as they are derived from participation in current production. Such income receipts as relief, unemployment benefits, pensions, gifts, capital gains or losses and gains from illegal activities are excluded since they do not represent earnings derived from current productive activity. The incomes included in the compilation are net incomes; that is, in the case of business enterprises, the incomes are counted after deduction of costs of doing business and after allowance for depreciation

and business taxes. In the case of corporations, the income is taken after allowance for income and excess profits taxes. The estimates are limited to those incomes which are ordinarily derived from the market economy. Thus, the value of the services of housewives is not included, whereas the income derived from government employment or government obligations is included. It is well to emphasize that the national income is not simply the sum of money incomes of all persons in the U.S., such as might be reported for income tax purposes.

The gross national product, as measured by the U.S. department of commerce, represents a summation of three major components: (1) the market value of goods and services flowing to consumers; (2) the value of the gross output of capital goods retained by private business; and (3) the cost value of the goods and services produced or purchased by government. The gross national product differs from the national income in that no allowance is made for depreciation and other reserves (which constitute business expenses in the computation of income) or for taxes paid by business.

Taken together, the national income and national product estimates provide a comprehensive picture of the current economic activity of the U.S. as a whole. The two sets of estimates represent the receipts (national income) and expenditures (national product) sides of a consolidated national account showing the major transactions that occurred during the year relative to current production of goods and services. The data are useful in giving quantitative expression to economic trends and problems of the national economy as well as in comparing the operations of an individual business firm with the national totals for all economic activity. During World War II the data proved of considerable value in dealing with problems of economic mobilization and fiscal policy. With attention being turned to postwar economic problems, this body of statistics was being utilized in studying postwar market potentials and in providing the framework for analyzing such problems as taxation and social security.

A significant development in the peacetime use of the national income and national product data was illustrated by the provisions of the Full Employment Bill of 1945. This bill, which was designed to set forth national policy with regard to maintaining full employment, provided for the submission of national product statistics in the budget message of the president to analyze the current and prospective economic situation as a background for formulating economic policies and programs to assure continuing full employment and full production.

**Changes in U.S. National Income, 1919-45.**—Estimates of national income from 1919 to 1945 are shown in Table I. It will be noted that the economic boom associated with World War I reached its high point in 1920. There followed a sharp and short liquidation in 1921 and then an almost continuous upsurge of economic activity during the prosperous '20s, with a new high for national income in 1929 not surpassed until 1941.

The estimates in the accompanying tables are in terms of dollars, and consequently are affected by the general level of prices as well as by the physical quantity of goods and services produced. Since for many purposes the physical quantity of national production, or real national income, is required, a series depicting this volume is also shown in Table I, average prices of 1935-39 being used as a base.

In assessing the importance of the rise in national income over a period of time, it is essential to take account of the increase in population. As population rises, there are more persons to share in the goods being produced for present and future consumption and also more hands available for contributing to total output. The changes in income produced

per capita, after adjustment for fluctuating prices, are shown in Table I.

The outbreak of World War II marked 1939 as the end of a definite phase in the economic life of the U.S. The stimulus provided by the great U.S. defense effort was already evident in 1940, when the national income rose more than \$6,000,000,000, even though the program was not inaugurated until the middle of that year. It was not until 1941, however, that the full impact of the rearmament program became apparent. In that year the national income rose by \$17,000,000,000.

With the actual outbreak of war at the end of 1941, the efforts to obtain the maximum output of armaments in the U.S. were intensified, leading to an ever greater use of available economic resources. As a consequence, the national income continued to expand in 1942 and 1943, with a gain in the earlier year of more than \$25,000,000,000 and a gain of more than \$27,000,000,000 in the latter.

As may be seen by a comparison of the national income in current dollars and in 1935–39 dollars as shown in Table I, the rise in the national income after 1940 was in part due to the rising trend of prices, but the larger part of the expansion represented an increase in real income.

The period of rapid wartime expansion of the national income came to an end at about the close of 1943. By that time the national income was flowing at an annual rate of approximately \$155,000,000,000, and represented virtually complete utilization of economic resources. As inflation of the national income through rising prices was held in check during 1944 by the price control and rationing programs, the national income in that year rose only moderately to \$160,700,000,000. It may be seen, therefore, that the fairly substantial increase in the

\*Preliminary.

national income from 1943 to 1944 occurred largely during the earlier year. Even so, 1944 national income exceeded the 1943 total by only 8% in terms of current dollars, while in terms of constant dollars the increase was limited to 6%.

The 1944 level of national income continued to prevail through the summer of 1945. Although the war production program was curtailed somewhat after the end of the European phase, re-employment in civilian industries was sufficient to hold the income level substantially stable. With the end of the Japanese phase, however, the cutback of war production was so substantial and affected so large an area of industry that unemployment rose and the flow of income turned downward. The reconversion of industry to peacetime products proceeded fairly rapidly after the end of the Japanese phase, but re-employment in civilian goods lines was not large enough to offset the release of workers from war production and the release of men from the armed forces.

**Distributive Shares of the National Income.**—The changes in the distributive share components of the national income are shown in Table II. In general, the changes in the distributive shares in 1945 were small in magnitude, as was to be expected from the small change in the national income total. However, the decline in the total flow of income for the first time after 1939 did not have a similar effect on all the distributive shares.

Inasmuch as the cutback of war production was the immediate cause of the decline of income in 1945, it was to be expected that wages and salaries would be the component most markedly affected. From the total of \$112,800,000,000 in 1944, wages and salaries declined to \$110,800,000,000 in 1945. This decline reflected primarily curtailment in pay rolls of manufacturing industries and the reduction of military pay rolls as the size of the armed forces was curtailed. While these movements were fairly substantial by the end of the year, the high level of wages and salaries during the first eight months of 1945 held the total for the year above any previous figure except that for 1944.

The net income of corporations after allowance for taxes also declined moderately in 1945. From a wartime peak of \$9,900,000,000 in 1944, net corporate income declined to \$8,800,000,000 in the following year, according to the preliminary data available. The decline in profits was relatively small in view of the sharp curtailment of war production in latter months of the year, due partly to the fact that reduced industrial activity affected excess-profit taxes rather than profits after taxes. Dividend payments remained substantially the same as in the previous year so that the small decline in corporate earnings was reflected mainly in corporate savings.

All the other components of the national income increased in 1945 despite the decline in the total. Agricultural income rose to \$12,700,000,000 from the 1944 figure of \$11,800,000,000 to establish a new record total. This increase was due to the tendency of agricultural prices to move upward during the year. Even after the end of the war there was little setback in agricultural prices. Farm output remained very high during 1945 though it was apparent at the end of the year that some decline from the peak production that was reached during World War II would be necessary.

Preliminary figures indicated that the income of other noncorporate business in 1945 was slightly higher than in the previous year. The continued high volume of retail trade was the most important factor in the maintenance of this component of national income. This occurred, despite the decline in wage earners' income, because of the availability of savings accumulated during the war and the desire of many persons to acquire products that were coming on the market for the first time in several years.

The flow of both rent and interest income continued to increase in 1945 by fairly substantial amounts. Interest payments reached \$7,500,000,000 as compared with \$6,700,000,000 in 1944. This increase resulted entirely from the larger interest payments of the federal government that were required because of the continued expansion of the national debt. In the case of rents, the rise in the income was due mainly to a small rise in rental rates although there was some increase in the number of dwelling units available for rental.

**Industrial Origin of National Income.**—Statistics on the industrial origin of national income are presented in Table III. In 1945, the only significant

‡Less than \$50,000,000.

change among these industrial components was that which occurred in manufacturing industry. The total income originating in this field declined from \$50,100,000,000 in 1944 to \$45,000,000,000 in 1945, reflecting the sharp cutback of war production after the end of the Japanese phase of the war. As income originating in manufacturing showed the greatest expansion during World War II, this development was not unexpected.

The changes of all the other industrial components in the national income were of small magnitude. It might be mentioned that income originating in government continued to rise in 1945 to reach a figure of \$33,800,000,000. Although government pay rolls began to decline after the end of the Japanese phase of the war, the fact that interest payments by the government were substantially larger and the rise in the size of the armed forces during the first half of 1945 raised the total income from government above the 1944 figure.

**Gross National Product.**—In Table IV are shown the statistical data on the gross national product. As previously mentioned, this aggregate declined in 1945 although not by a substantial amount. This decline was due entirely to the reduction in the war spending of the government which fell from \$83,700,000,000 in 1944 to \$69,500,000,000 in 1945. On the other hand, the nonwar expenditures of the government rose by \$1,000,000,000 in 1945.

As a result of the release of facilities from war production during the second half of 1945 it became possible for the first time after 1941 to obtain a moderately increased flow of civilian goods. Due to the initial reconversion difficulties, the increase of civilian goods was not very large in 1945, but it was well under way by the end of the year. Construction activity showed an immediate pickup with the ending of hostilities, reaching \$2,700,000,000 for the year as compared with \$1,600,000,000 in 1944. Expenditures on machinery and equipment also rose significantly during the year due to reconversion requirements, expenditures on these goods reaching \$5,200,000,000. With supplies being considerably freer after the end of hostilities, the wartime shrinkage of business inventories stopped, although there was no appreciable replenishment of manufacturers' and dealers' stocks.

Consumers' expenditures on goods and services rose moderately in 1945 to a total of \$103,600,000,000. This contrasted with the 1944 figure of \$98,500,000,000. The expansion of consumers' expenditures was divided among durable goods, nondurable goods and services, though the nondurable goods segment showed the largest dollar rise. There was little tendency for prices to rise in 1945 so that the expansion of consumers' expenditures largely reflected an increase in the availability of supplies. In the nondurable goods field, the ending of gasoline and fuel oil rationing was an important factor in the increased expenditures and certain food and clothing items were also more plentiful. In the durable goods field, supplies were increased during the second half of the year although production was far from on a peacetime basis by the end of the year.

**Consumer Income and Savings.**—The data on the disposition of national income are shown in Table V. The primary purpose of this breakdown of the national income is to show the allocation of income between consumers' expenditures, savings and taxes.

Although the national income declined in 1945, income payments to individuals actually increased more than \$3,000,000,000 above their 1944 total. This was due primarily to the increase in government transfer payments, particularly unemployment benefits and mustering-out pay to members of the armed services. Taxes paid by individuals were also increased in 1945 with the result that the disposable income of individuals

rose from \$137,400,000,000 in 1944 to \$138,900,000,000 in 1945. This small rise in disposable income did not affect consumers' expenditures disproportionately due to the fact that the savings of individuals during the entire wartime period had been abnormally high. With consumers' expenditures advancing a little more than \$5,000,000,000 there was a decline in net savings of individuals from \$38,900,000,000 in 1944 to \$35,300,000,000 in 1945. This was still an unusually high level of individual savings. (See also BUDGET, NATIONAL; BUSINESS REVIEW; DEBT, NATIONAL; WEALTH AND INCOME, U.S. DISTRIBUTION OF.) (M. Gt.)

### Income Tax: see TAXATION.

**India.** A sub-continent projecting from the mainland of Asia, India lies between the 8th and the 37th degrees of north latitude. It comprises 11 major or "autonomous" provinces, five minor areas directly administered by the central British government and a large number (between 500 and 600) of states under Indian rulers. The latter states are scattered about the sub-continent and vary greatly in size and importance, as well as in the powers enjoyed by their chiefs. British India (the 16 major provinces and minor areas) has its capital at New Delhi and is under a viceroy and governor-general (Field Marshal Viscount Wavell), who is also the representative of the crown in its relations with the native states. The total area is 1,581,410 sq.mi. of which the native states and agencies total 715,964 sq.mi.; pop. (1941 census) 388,997,955. Chief cities (census, 1941): Calcutta (2,108,891); Bombay (1,489,883); Madras (777,481); Hyderabad (739,159); Delhi (521,849); Lahore (671,659). Languages: Hindi, Tamil and Urdu the most important; religions, Hinduism (approx. two-thirds), Moham-medan (approx. one-fifth). Ruler, George VI, emperor.

**History.**—The year 1945 was one of strenuous attempts to arrive at a political settlement. After the failure of the Gandhi-Jinnah conversations and the conciliation committee called by Sir Tej Bahadur Sapru, it was evident that the government would have to take the initiative. The immediate problem was that of the Indianization of the viceroy's executive council. On March 23, Lord Wavell went to London for consultation with the British cabinet, and on June 14 a statement of policy was made in the house of commons by L. S. Amery, the secretary of state for India. He said that if the offer made by his majesty's government were accepted, all the portfolios except that of war member, held by the commander in chief, would be transferred to Indian hands. They would include not only those of the home and finance departments, but also external affairs, up to that time reserved to the viceroy in person. This would naturally be accompanied by the appointment of fully accredited representatives abroad, and so constitute a definite advancement of India's international status. In selecting his council the viceroy would endeavour to secure a balanced representation of

the main communities, including equal proportions of Moslems and Hindus. The new executive would thus be made representative of organized Indian political opinion. If these proposals were agreed to, ministerial government would be resumed, on a coalition basis, in the provinces which had passed under "governor's rule" when the congress ministries were withdrawn on the outbreak of war. The 15 members of the Congress Working committee, who had been interned in Aug. 1942 were to be released.

On his return to India the viceroy called a round table conference of 21 representatives of the Indian political parties at Simla on June 25. The various groups were asked to submit lists of names from which the viceroy would choose after consultation with the party leaders. After protracted discussions the conference broke down because Mohammed Ali Jinnah, the head of the Moslem league, refused to submit a list of nominees without a preliminary guarantee that all the Moslem members should come from the Moslem league. On Aug. 25 the viceroy went again to London to consult with Lord Pethick-Lawrence, who had succeeded Amery as secretary of state.

On Sept. 12 Lord Wavell returned to India, and it was announced that elections to the central and provincial legislatures would be held in the coming cold weather. This would be followed by positive steps to set up a constituent assembly of Indian elected representatives charged with the task of framing a new constitution. The viceroy would undertake preliminary discussions with the representatives of the new provincial legislatures and of the Indian states to ascertain whether the proposals in the Cripps offer were acceptable or should be modified. After the elections, the viceroy would, as an interim measure, bring into being an executive council having the support of the main Indian parties, in order that India might deal itself with its own social and economic problems, and take its full part in working out the new world order.

On the economic side, Sir John Woodhead's report on the Bengal famine revealed the necessity of systematic planning if the problem of Indian poverty were to be solved. Sir Ardesir Tata, formerly director of the Tata iron and steel works, was appointed as reconstruction officer, and the Indian government announced that it was engaged on plans for taking over 20 basic industries after the war, together with others for which adequate private capital was not forthcoming; these would be spread over

wide areas, so as to secure a balanced economy. Loans would be advanced to encourage private enterprise. A party of nine leading Indian industrialists visited England and the United States to purchase capital goods for postwar development.

(H. G. RN.)

**Education.**—(1940-41): Number of recognized institutions in British India (excluding Burma): primary schools, male 161,122; female 26,042; scholars, male 10,258,201; female 1,539,648; secondary schools, male 12,957; female 1,754; scholars, male 2,404,745; female 346,494. Unrecognized institutions 18,862 with 590,567 scholars. Universities, British India 15, scholars, male 109,098; female 5,006.

**Finance.**—Revenue, central government (est. 1944-45) \$1,114,980,000; (est. 1945-46) \$1,071,980,000; expenditure, central government (est. 1944-45) \$1,279,798,800; (est. 1945-46) \$1,563,640,000; public debt (March 1945) \$5,675,800,000; notes in circulation (June 1, 1945) \$3,384,300,000; reserve (May 31, 1945): gold \$133,732,800, silver rupee coins \$48,192,000, sterling securities \$3,070,131,600. Currency: 1 rupee (Rs.1); Rs.100,000 = 1 lakh, written Rs.1,00,000; Rs.10,000,000 = 1 crore = 100 lakhs, written Rs.1,00,00,000; 100 crores is written Rs.100,00,00,000. Exchange rate (July 1945) Rs.1 = 30.12 U.S. cents.

**Trade.**—Overseas trade (1944-45): imports, merchandise \$605,353,000; exports, Indian merchandise \$635,699,000; re-exports (1943-44), merchandise \$32,912,000; gold coin and bullion (1939), imports \$4,939,700; exports \$94,094,900; imports of Afghan merchandise (1939-40), \$11,950,000; exports of Indian produce to Afghanistan (1939-40), \$2,200,000.

mills 401; average number employed 502,650. Jute (1938-39): mills 107; average number employed (1937-38) 309,000. Total number of factories (1939) 10,466; average daily number employed (1939) 1,751,137. (See also BURMA; FAMINES; WORLD WAR II.)

**Indiana.** A north central state with the popular name "Hoosier," Indiana entered the union Dec. 11, 1816, as the 19th state. The total area of the state is 36,519 sq.mi., including 314 sq.mi. of water. Pop. (1940 census) 3,427,796. According to the 1940 census 1,887,712 or 55.1% were urban; 1,540,084 or 44.9% rural. Of the total, 93.2% were native white, 3.2% foreign-born white and 3.6% Negro. Estimated population in 1945 was 3,743,328. Capital, Indianapolis (pop. 1940, 386,972), the largest city. Other cities: Fort Wayne (118,410); Gary (111,719); South Bend (101,268); Evansville (97,062); Hammond (70,184); Terre Haute (62,693); East Chicago (54,637); Muncie (49,720); Anderson (41,572).

**History.**—The 84th regular session of the general assembly convened Jan. 4-March 5, 1945. It provided for an aeronautics commission, a flood control commission, a veterans' affairs commission, the establishment of the Northern Indiana hospital for treatment of mental disorders, and appropriation for additional buildings on the site of the Indiana War memorial for the use of the American Legion national headquarters and created a public employees' retirement fund.

Officers of the state in 1945 were: Ralph F. Gates, governor; Richard T. James, lieutenant governor; Rue J. Alexander, secretary of state; Frank T. Millis, treasurer; Alvin V. Burch, auditor; James A. Emmert, attorney general; Clement T. Malan, superintendent of public instruction.

**Education.**—The number of schools in the state in the school year 1944-45 was 2,764. Enrolment in the elementary or common schools was 456,770, with 11,579 teachers. Enrolment in the high schools (grades 9-12) was 168,817, with 1,147 junior high school teachers and 7,490 senior high school teachers. Parochial schools had an enrolment of 48,073 in the elementary grades and 8,984 in high school.

The sum of \$29,197,220.39 in state support funds was allotted to the local school corporations in the fiscal year ending June

30, 1945 (\$24,741,287 for the fiscal year ending June 30, 1944). Total expenditures for the schools in the fiscal year ending June 30, 1945, were \$68,425,260.90.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The total expenditure of the state's welfare program in the fiscal year 1944-45 was \$26,131,421.83 of which \$10,844,878.85 was paid from federal funds, \$7,910,148.80 from state funds and \$7,376,394.18 from county funds. Aged assistance totalled \$17,819,999; blind assistance \$788,770.45; aid to dependent children \$2,863,022.96. Receipts of the state for unemployment insurance for the fiscal year ending June 30, 1945, were \$35,710,998. Benefits paid were \$1,256,108.

The state in 1945 maintained eight institutions for mental cases (including epileptics); nine homes, hospitals and schools; three university hospitals; and six correctional institutions. Inmates of the state institutions June 30, 1945, numbered 18,991, which included 12,891 in institutions for mental cases, and 4,700 in correctional and training schools. As of June 30, 1945, there were 3,628 in the 87 county infirmaries in the state.

**Communications.**—Total mileage of state highways as of June 30, 1945, was 10,431.30. Total expenditures of the state highway commission on roads in the fiscal year 1944-45 were \$19,475,095. On June 30, 1945, there were 6,659 mi. of steam railroads (sidetracks omitted) with an assessed valuation of \$362,414,276. There were 239.69 mi. of electric railroads with an assessed valuation of \$8,653,744.

According to the latest (Dec. 1944) survey by the Indiana Economic council, Indiana had 63 airports and the state was served by four commercial air lines.

**Banking and Finance.**—On June 30, 1945, there were 374 state banks and trust companies with total resources of \$1,281,850,501.94 and deposits of \$1,207,288,567.58. In Dec. 1945 there were 126 national banks.

State savings and loan companies numbered 178 (June 1945) with assets of \$116,844,390.17. The assets of the federal savings and loan associations as of Dec. 31, 1945, were \$178,392,000.

The revenue of the state to meet the 1944-45 budget was \$59,347,921 in the general fund and \$26,091,440 in special funds. Appropriations for the fiscal year 1944-45 amounted to \$42,142,558 and disbursements amounted to \$26,570,919.14. The estimated state revenue for 1945-46 fiscal year was \$50,500,000. Appropriations amounting to \$54,208,170 were made for the fiscal year 1945-46. The state balance on July 1, 1945, was \$29,145,382. Approximately \$49,000,000 was in the state general fund on Dec. 31, 1945.

The state constitution strictly limits state borrowing; therefore on June 30, 1945, there was no state debt.

**Agriculture.**—In 1945 there was the largest corn crop in the history of the state with an average yield of 53 bu. per acre, which was the highest for any state in the country. Indiana ranked third in the nation in the production of canned tomatoes and tomato juice. It produced two-thirds of the United States production of peppermint and spearmint oil.

#### Leading Agricultural Products of Indiana, 1945 and 1944

Crop	1945 (est.)	1944
Corn, bu. . . . .	243,376,000	176,244,000
Wheat, bu. . . . .	37,590,000	26,408,000
Oats, bu. . . . .	62,092,000	31,400,000
Soybeans, bu. . . . .	28,640,000	23,150,000
Rye, bu. . . . .	1,330,000	1,080,000
White potatoes, bu. . . . .	4,620,000	3,115,000
Barley, bu. . . . .	1,134,000	1,296,000
All tame hay, tons . . . . .	2,639,000	2,577,000

**Manufacturing.**—In the period June 1940-May 1945 Indiana received government contracts for war supplies amounting to \$8,917,000,000 (\$3,676,000,000 in aircraft production, \$1,530,000,000 in communication equipment, \$464,000,000 in ship production and \$3,247,000,000 in ordnance). Indiana ranked

seventh in the U.S. in the production of war supplies. Reconversion from war industries made a steady gain in the later months of 1945 with the manufacture of automobiles and automotive parts, aircraft parts, steel and rolling mill products, implements, pharmaceuticals and hosiery the chief industries.

**Mineral Production.**—Total production of coal tons mined in the fiscal year ending June 30, 1945, was 12,609,262. Total wages paid were \$16,211,681. The number of employees in all mines was 6,050. There were 21 fatalities. In 1944, 331 oil and gas wells were completed; 4,950,000 bbl. of oil were produced. In the first 11 months of 1945, 240 oil and gas wells were completed.

(M. H. A.)

**Indians, American.** On Jan. 19, 1945, after serving 12 years, John Collier tendered his resignation as commissioner of Indian affairs to the president. William A. Brophy was appointed his successor and was confirmed by the senate on March 6, 1945. Brophy had been a lawyer in Albuquerque, N.M., and for nine years served as attorney for the Pueblo tribes. In 1942, he accompanied a senatorial committee investigating Puerto Rico, and after assisting in the preparation of the committee report became director of the Puerto Rican section of the division of territories and island possessions of the department of the interior. He held this position at the time of his appointment as commissioner. Brophy thus was familiar with the minority problem and sympathetic with the needs of the Indians.

On Feb. 3, 1945, the Colorado river Indian tribes adopted a resolution opening three quarters of their reservation to settlement by other Indians of the Colorado river watershed. The area involved amounted to about 75,000 ac. which together with the northern 25,000 ac. would be subjugated and irrigated in accordance with congressional policy as stated in numerous appropriation acts. Approximately 2,000 ac. were subjugated by the War Relocation authority, which occupied the land for a Japanese relocation centre. With the closing of this centre toward the end of 1945, 16 Hopi families composed of approximately 85 persons became the first voluntary settlers to move to this new area. It was believed that approximately 15,000 Indians might ultimately find homes there.

Beginning in the late spring of 1945, the Aleuts who had been evacuated to the Alaska mainland were returned to their island villages by the navy, and under the supervision of the Indian service began reconditioning their homes with funds made available by the federal government. Mrs. C. Foster Jones, formerly Indian service teacher on Attu, who had been captured by the Japanese during the invasion, was returned to the United States on Sept. 12. About 25 out of the 45 natives who were on the island at the time of the invasion were also released from a Japanese prison camp. Mr. Jones and several of the natives had been killed during the invasion. Aside from a few cruelties at the time of the immediate invasion, all had been well treated by the Japanese, and the Attu islanders returned to Alaska in December.

In Feb. 1945, the Alaska territorial legislature enacted a civil rights statute, forbidding discrimination. This made illegal refusal by restaurants, hotels, etc., to serve natives because of race.

On March 12, 1945, the United States supreme court rejected an appeal by the Shoshone Indians of Utah from a decision of the court of claims denying their claims to reimbursement for lands taken by the United States after 1907 without compensation. It was a 5-4 decision and the majority opinion written by Justice Jackson held that any wrongs involved were committed by U.S. white forefathers against the remote ancestors of the plaintiffs, and therefore the U.S. was not legally obligated to correct them. Many of the statements in the decision with regard

to the nonexistence of aboriginal exclusive occupancy shocked anthropologists and others familiar with Indian life and customs. The decision resulted in a surprisingly unanimous editorial condemnation by daily newspapers as well as friends of the Indians. A request for rehearing was denied.

On July 27, 1945, the secretary of the interior issued an opinion in answer to the petitions of the natives of the villages of Hydaburg, Klawock and Kake, Alaska, claiming certain lands and waters in southeastern Alaska. Extensive hearings had been held in several communities in Alaska, and at Seattle, Wash., before an examiner appointed by the secretary. Briefly the secretary's conclusions denied the claims of the natives of Hydaburg, Klawock and Kake to exclusive possession of 92% of the lands claimed as aboriginally occupied, and confirmed their title to 8% of the claims adjacent to these villages. Their claims to exclusive possession of adjacent ocean waters were also rejected. Their right to hunt, fish, trap and gather wild products in common with other persons on areas remaining in public ownership was confirmed. The policy of the United States to recognize aboriginal rights where native possession has been continuous and exclusive is affirmed as applicable in Alaska as in the states of the union. The petitioners and protestants requested a rehearing.

Announcement was made during 1945 that the purest form of helium yet found in the United States had been discovered in connection with oil drilling on the northern part of the Navaho reservation. A plant was developed by the federal government during World War II but extraction stopped with the end of hostilities and the deposit was to be retained as a federal reserve.

Reports for the year indicated that there were 27,767 Indians in the army, 1,910 in the navy, 121 in the coast guard and 723 in the marines. These figures do not include officers, for whom no statistics were available in 1945. Several hundred Indian women were in the various branches of the services.

The Indian office was informed of 72 awards of the air medal, 35 of the distinguished flying cross, 52 of the silver star, 53 of the bronze star medal, 4 of the distinguished service cross, 3 of the soldier's medal, and 2 of the congressional medal of honour to Indians. Lieut. Ernest Childers, a Creek, of Broken Arrow, Okla., was the first winner of the nation's highest award, and Lieut. Jack Montgomery, a Cherokee, was the second.

Many awards were not reported to the Indian office, and some of the ribbons worn were decorated with oak leaf clusters awarded in lieu of further medals. It was not unusual to see an air medal with nine oak leaf clusters, and there were some with 12 or 14.

A full-blooded Pima, Pfc. Ira Hayes, was one of the six flag raisers on the summit of Mt. Suribachi, Iwo Jima. Harvey Natchees, a Ute, was the first U.S. soldier to enter the centre of Berlin. LeRoy Himlin, another Ute, was with the first group to make contact with the Russians on the Elbe river. The marine corps enlisted about 300 Navaho Indians to serve as code talkers in their front line communications using their native language which proved an unbreakable code.

**Industrial Health.** The cessation of industrial production in the United States for World War II in the late months of 1945 was attended by marked reductions in the industrial health activities of the army, navy and maritime commission. Medical, nursing and technical personnel as-

signed to the vast wartime operations in shipyards, munitions plants, aeroplane factories and ports of embarkation were available for redistribution elsewhere. Nevertheless, in respect to industry as a whole, experience indicated that interest in industrial health and welfare would continue well into the postwar era. The demand for industrial health service was still greater than the medical and allied professions were prepared to meet, although returning medical officers began to alleviate these shortages. Many of these returning physicians felt the need of additional training. A number of medical schools and professional bodies therefore undertook to meet this requirement and began preparations for refresher and orientation courses as well as longer periods of study calculated to lead toward specialization in industrial medicine. The end of the year was further signalized by the decision of the American Medical association to publish a monthly journal devoted to the advancement of standards of medical care in industry and to promote greater medical participation in the solution of socioeconomic problems in rehabilitation and workmen's compensation.

The predominant medical problem in industry continued to be veteran reconditioning and re-employment. Actual experience showed that the uninjured veteran was not a problem and that he readjusted to civilian employment readily and well. The full impact of the seriously disabled veteran had not yet reached industrial medical departments. The Veterans' administration announced that its rehabilitation activities would be greatly intensified, that physical and occupational therapy would be available in all its facilities, and that great care would be taken in bridging the gap between vocational training in a hospital and civilian employment. Considerable progress was made in the federal-state rehabilitation program sponsored by the Office of Vocational Rehabilitation in the Federal Security agency. Administration of this plan was accelerated in the states by improved medical advisory relations and the steady development of standards of medical care, hospitalization and vocational training. Since aid to the handicapped must be largely conditioned on the willingness of industry to accept them as employees, the United States Employment service and the Council on Industrial Health of the American Medical association continued to investigate the values of medically supervised placement in jobs adapted to physical, mental and emotional disability or maladjustment. Studies were continued on the advisability of setting up community rehabilitation centres which would provide suitable quarters, equipment and personnel to admit handicapped individuals, evaluate their disability and supply such services as are necessary to return them to full employment, selected jobs, sheltered work, or home bound activity as the case may be. A special subcommittee of the committee on labour of the house of representatives conducted a series of hearings relating to the status of the blind, deaf and hard of hearing, epileptics, amputees and victims of other disabling conditions eligible for aid under the existing government plans. The apparent intention was to consolidate government activities in rehabilitation as a means of promoting efficient care and avoidance of duplicating efforts.

Several developments designed to extend industrial medical service to groups not previously covered gained momentum. Bills under consideration in the senate and house would entitle government employees to receive treatment for minor illness, pre-employment and other examinations, health education, alleviation of hazards and referral to private physicians for non-occupational illness. Small plants in the Long Island city area were being provided with nursing supervision by the New York city health department on condition that they employ a physician, maintain proper records and set up suitable facilities. Industrial executives, as a class, have not ordinarily participated in

industrial health service. One large corporation adopted a plan of physical examinations for executives, the defects discovered to be corrected through the regular channels of community medical practice.

The physician's ability to contribute to human relations in industry came in for serious study. Counselling techniques in certain industries, which enabled workers to secure help in the solution of personal problems not necessarily related to work, were recognized as excellent psychotherapy. Psychiatrists in other ways were drawn into the industrial health picture. A plan for the employment of psychoneurotics, whether veterans or victims of industrial accidents, was prepared for the National Association of Manufacturers. A committee was developed representing psychiatric medicine, industrial medicine, management and labour, to explore behaviour problems, occurrence of friction between worker and supervisor, motivation, aptitudes and other similar matters which might be expected to improve under study and observation from the psychosomatic point of view.

Steps were taken to associate aviation medicine more closely with the industrial medical program. Co-operation between the Aero Medical association and the Council on Industrial Health of the American Medical association was arranged in order that advances made in military aviation medicine could be brought to the attention of physicians at large. Tropical disease became a factor in industrial medicine, detected largely in veterans examined for employment. The use of aluminum in a number of forms to prevent the occurrence of and to treat silicosis was the subject for special investigation by a committee made up of industrial physicians, pharmacologists, pathologists and representatives of the aluminum industry. Many other advances were recorded in the medical literature regarding identification, prevention and clinical management of occupational exposures.

Casualty insurance interests and the medical profession joined hands with administrators of workmen's compensation in the United States and Canada to set up a National Workmen's Compensation board designed to investigate and recommend improvements in the whole structure of indemnification for industrial accidents and occupational diseases. This step was considered as the greatest advance in this field after the adoption of the commission form of administering workmen's compensation affairs. (See also ACCIDENTS; DERMATOLOGY; MEDICINE.)

**Industrial Production:** see BUSINESS REVIEW; WAR PRODUCTION, U.S.

**Infantile Paralysis.** During 1945 additional evidence was accumulated showing that infantile paralysis (poliomyelitis) increased both geographically and numerically. Apparently these increases were actual and not the result of better reporting. Differential diagnosis of the disease was aided, at least to a degree, by more accurate diagnosis of other neurotropic virus diseases frequently confused with, and often reported as, infantile paralysis. Reports on a world-wide basis were necessarily fragmentary and incomplete, but outbreaks were reported in several European countries, the Philippines, Central and South America. In the United States more than 13,000 cases were reported, making the total for the three-year period 1943, 1944 and 1945 greater than during any previous five years of the past.

Intensive study of numerous outbreaks added further evidence in support of the theory that this disease is spread largely by contact, and that water, food, milk, flies and other vectors play relatively unimportant roles in dissemination of the virus. Study of the child population surrounding a known case brought forth once more the fact that during an infantile paralysis outbreak there are far more mild poliomyelitis-like illnesses than

B-25 BOMBER, loaded with 1,650 gal. of DDT solution, sprayed the city of Rockford, Ill., in the summer of 1945, in an experiment aimed at killing flies believed to be possible carriers of the polio virus

paralytic infections. A history of contact could be elicited in the majority of these mild illnesses. By careful laboratory work a large percentage of these vague, undiagnosed and unreported deviations from normal health was shown to be associated with, if not due to, a poliomyelitis virus infection, with the virus recoverable from both throat and stools. These cases were in addition to the entirely symptomless healthy carrier.

A study in Chicago, Ill., showed that when these mild infantile paralysis-like infections were considered, the communicability of this disease in the child population of one and one-half to three and one-half years of age was approximately 90%. The disease was far less infectious in those under one and one-half and decreasingly so in the older groups.

No advances were recorded during 1945 in the attempt to develop a specific therapeutic agent. The old problem of the role of convalescent serum was restudied in a new form. Gamma globulin was administered to alternate cases in a series of 111 proven infantile paralysis patients. Fifty-six preparalytic patients were given large doses of gamma globulin known to have a high poliomyelitis neutralizing antibody content. These patients were followed for six months, together with 55 control cases. There was no evidence of any benefit from the use of serum. This most carefully conducted and controlled study should put an end for all time to any question of prevention of paralysis, or speedy recovery, in infantile paralysis through the use of this type of therapy.

Reports were published during the year of the supposed value of various drugs in the treatment of the spasm of infantile paralysis. These, however, were contradictory in nature or were based on too few and too superficial observations to warrant definite conclusions. Prostigmine and curare derivatives received the major amount of attention, but no critical experiments were undertaken and a vast amount of work remained to be done before it could be determined what role, if any, these drugs play in treatment of this disease.

Additional evidence was produced to show that the symptoms of infantile paralysis were not dependent solely upon damage of anterior horn cells, but were to a very large extent the results of both temporary and permanent lesions of a highly complex

and diffuse character in higher levels. The wide range of disturbance of the neuromuscular system was shown to be due, not to known motor neuron damage, but to injury to other parts of the nervous system.

The early use of physical therapy and particularly muscle re-education in infantile paralysis gained wider acceptance and greater use than ever before. While statistical proof was lacking, it was the opinion of well-informed workers that the intelligent and intensive use of this method of treatment had reduced the number of permanent deformities and lessened the handicapping effects of such deformities and paralyzes as persisted.

In the United States, the National Foundation for Infantile Paralysis, with its chapters serving more than 95% of the population, spent approximately \$6,500,000 for the medical care of reported cases. For the most part these patients were hospitalized. This amount of additional medical service could not help but lessen the dangers of this disease. (See also EAR, NOSE AND THROAT, DISEASES OF; EPIDEMICS AND PUBLIC HEALTH CONTROL; NERVOUS SYSTEM.)

**Infant Mortality.** A new low point in infant mortality was reached in the United States in 1945, according to provisional records for the first nine months of the year. The infant mortality rate during this period was 4% below that for the corresponding period of 1944; only February and August were above the previous year. Altogether, there were 111,127 deaths within the first year of life in the U.S. during 1944, the infant mortality rate being 39.8 per 1,000 live births. Compared with 1941, the last prewar year for the U.S., the rate for 1944 shows an improvement of 12%. Within this brief period, there were record numbers of births whose delivery and care had to be handled by a dwindling supply of civilian physicians and nurses; at the same time, the demand for hospital services strained their facilities. A favourable factor during these years was the federal emergency maternal and infant care program introduced in 1943 to provide for the mothers and infant children of men in the initial ranks of the armed services; by the standards set, many mothers and their babies received a level of attention not otherwise available to them. The proportion of births attended by a physician in 1945 was undoubtedly higher than the 93% observed in 1943 (the latest figure available).

The infant mortality rate for white babies in the U.S. was 36.9 per 1,000 live births in 1944; the comparable rate for 1943 was 37.5 per 1,000. For nonwhite races the rate was 60.3 in 1944 and 62.5 in 1943. Infant mortality rates per 1,000 live births reported in 1943, the latest year with complete records, varied from 36.3 in cities of 100,000 or more population to 41.2 in cities of 25,000 to 100,000; to 42.9 in cities of 10,000 to 25,000; and then to 44.5 in places of 2,500 to 10,000; rural areas had a rate of 41.4. The lowest rate, 30.0 per 1,000, was found in Connecticut; Oregon and Minnesota were almost as good with rates of 30.8 and 30.9 respectively. With the excep-

tions of Maine and New Hampshire, the states in the northern tier of the country and on the Pacific coast had rates below 40 per 1,000. With the exception of Arkansas, all the states of the south had rates above 40 per 1,000. New Mexico was highest with a rate of 93.1 and Arizona next with 79.6 per 1,000.

Infant mortality rates per 1,000 live births in 1943 from the principal causes of death for the white, Negro and other races were, respectively: premature birth, 11.4, 15.1, 11.4; pneumonia and influenza, 5.3, 12.6, 20.2; congenital malformations, 5.2, 2.6, 4.1; injury at birth, 3.8, 3.3, 3.3; and diarrhoea and enteritis, 2.7, 4.8, 13.1. The distribution of deaths according to age within the first year of life for white infants was: 30.4% of all first year deaths within the first day of life; 51.5% during the first week; and 63.2% during the first month. For Negro infants, the corresponding figures were 21.6%; 40.7%; and 53.8%; while for other races, they were 13.4%; 25.4%; and 34.7%.

In England and Wales infant mortality during 1945 was not quite as favourable as in 1944, according to provisional reports received for the first nine months from London and the great towns; these show an increase in infant mortality of more than 4% from one year to the next. For all of 1944 there were reported 33,456 deaths under one year of age and an infant mortality rate of 45 per 1,000 live births; the corresponding rate in 1943 was 49 per 1,000 live births. During the war years, England and Wales had a high point of 60 infant deaths per 1,000 live births in 1941. The most recent record for Canada, relating to 1944, reported 15,498 deaths in the first year of life, with an infant mortality rate of 55 per 1,000 live births; the corresponding figure for the two previous years was 54 per 1,000.

The accompanying table summarizes infant mortality rates recorded for a number of countries in 1943.

Deaths Under One Year of Age per 1,000 Live Births, 1943

Country	Rate	Country	Rate
Argentina . . . . .	78	Nicaragua . . . . .	99

Reviewing the factors which may influence infant mortality, J. Yerushalmy (*Annals of the American Academy of Political and Social Science*, 237:134-141, Jan. 1945) points to recent investigations which indicate the beneficial effects of proper nutrition and rest to mothers during pregnancy. Babies born to mothers from 20 to 30 years of age have lower infant mortality rates than those with younger or older mothers. The rates are most favourable for children second and third in order of birth. Evidence was also found to suggest a familial-tendency to stillbirths and high mortality in early infancy.

**Institutum Divi Thomae.** The Institutum Divi Thomae is the graduate school of scientific research of the Athenaeum of Ohio. Its purpose is to foster fundamental research in the natural sciences and to determine, as far as possible, the basic laws governing natural phenomena. Its aim also is to train a limited number of graduate students in the various fields of the natural sciences for which they are best suited.

The Institutum was established in June 1935 by the Most Reverend John T. McNicholas, archbishop of Cincinnati, with Dr. George Sperti, member of the Pontifical Academy of Science.

With a limited number of select students, methods of teaching employed in the mediaeval schools were adopted. Formal classes are attended regularly but the greater part of the time is devoted to study and research in the laboratories where small groups, working under their professors, investigate problems in the field of their major interest.

The Institutum Divi Thomae has its principal laboratories in Cincinnati, O., and maintains a marine biological laboratory together with a floating laboratory at Palm Beach, Fla.

A series of affiliated laboratories engaged in both scientific and clinical research is established at colleges and hospitals throughout the United States. The researchers are a part of a co-ordinated program under the direction of the Institutum. An annual conference of research workers from the various units aids in promoting the co-operative research program.

The affiliated laboratory units in 1945 were as follows:

Rosary college, River Forest, Ill.; Siena Heights college, Adrian, Mich.; Barry college, Miami, Fla.; Marymount college, Salina, Kan.; Our Lady of Cincinnati college, Cincinnati, O.; St. Mary's Dominican college, New Orleans, La.; Incarnate Word college, San Antonio, Texas; Mercy hospital, Mariemont, O., an irradiation unit for the treatment of cancer; St. Scholastica, Duluth, Minn.; St. Mary's of the Springs, Columbus, O.; Immaculata college, Immaculata, Pa.; St. Joseph's college, Rensselaer, Ind. A research program is conducted in co-operation with the Skin and Cancer clinic of the New York Postgraduate Medical school and hospital, New York. Umbrian Farms, Lafayette, N.J.; Burlington Farm Agricultural unit, Burlington, Ky.; Rookwood Ceramic Research unit, Rookwood Pottery, Cincinnati, O.

The Institutum Divi Thomae in 1945 had reconverted to a peacetime schedule of research activity after devoting a major portion of its program to assist in the war effort of World War II. (E. M. HN.)

**Insulin:** see DIABETES.

**Insurance.** Life.—During 1945 the legal reserve life insurance companies of the United States and Canada increased their investments in government bonds by about \$5,000,000,000, an amount greater than the increase for the year in the companies' total assets. At the end of 1945 the total life insurance (excluding reinsurance) in force in these legal reserve companies was estimated at approximately \$163,000,000,000, about 4% greater than the amount outstanding at the end of 1944. New paid-for insurance during 1945 amounted to about \$16,000,000,000. The assets of the companies at the end of 1945 reached a total of about \$48,000,000,000, after paying or crediting to policyholders and beneficiaries about \$2,900,000,000 during 1945.

Apart from war deaths, 1945 ranked among the years of relatively low mortality in the United States and Canada. Indeed, civilian mortality in these countries was remarkably good throughout the duration of World War II. The record for the armed services was, of course, of a different nature. In the first eight and one-half months of 1945, i.e., up to the termination of the war in August, war deaths resulting from enemy action com-

prised about 13% of total deaths among ordinary policyholders, as compared with 8% for the year 1944; the corresponding figure for the full year of 1945 was about 10%. The proportions among industrial policyholders were considerably smaller because of the larger ratio of women and children insured under policies of this type.

Leaving out of account the temporary effect of asset gains, the interest rate earned during 1945 on the aggregate of life insurance companies' assets continued the steady decline characteristic of previous years. This reflected to a marked degree the low yield obtainable on suitable new investments, particularly on United States and dominion government bonds which represented almost 50% of the assets of the companies at the end of 1945, and also on new issues and open-market securities generally.

Continued progress was made during 1945 in the nation-wide legislative program to have new standard valuation and nonforfeiture laws enacted in the individual states. Up to the end of 1945 the proposed standard legislation had been enacted by 23 states; there were 11 other states in which the proposed measures appeared acceptable under existing statutes. The proposed legislation had been recommended by the National Association of Insurance Commissioners and endorsed by many life insurance organizations. It provided for the use of modern mortality tables, and dissociated, to a greater extent than did existing laws, the minimum nonforfeiture requirements from the policy valuation basis. It also provided a new method of determining minimum nonforfeiture values under which such values were more nearly related to the real equities of the policyholder at the time of default than had been true under existing nonforfeiture legislation.

After the supreme court of the U.S. had decided in June 1944 that insurance was commerce and when conducted across state boundaries was interstate commerce as respects such statutes as the federal Sherman Anti-Trust act, legislation which was introduced in congress in this connection became of acute interest to the whole insurance business and to the state regulatory authorities. A law was finally enacted in March 1945, under which supervision and taxation of the insurance business by the individual states was continued. With some exceptions, the application of the federal anti-trust and certain other laws to insurance was suspended until Jan. 1, 1948, but these laws would be in effect thereafter to the extent that such business is not regulated by state laws.

**BIBLIOGRAPHY.**—*The Spectator (Life) Insurance Year Book (1945); Report of the Superintendent of Insurance of the Dominion of Canada, vol. ii, Life Insurance companies (Ottawa, Ont., 1945).* (L. A. L.)

**Automobile.**—The unfavourable trend of automobile experience in the U.S. continued through 1945. A marked increase in frequency occurred when gasoline rationing was lifted. The property damage and collision coverages were particularly unprofitable. Collision rates were substantially increased in the early part of the year but the increase was inadequate. Liability and property damage rates for private passenger cars were increased to a point slightly under the 1941 level at the end of the year with most companies returning to the old classification plan of rating.

(F. M. R.)

**Blue Cross.**—Membership in nonprofit Blue Cross plans for hospital care increased nearly 5,000,000 in 1945 to total 21,000,000 persons enrolled through 86 plans in 43 states, Puerto Rico and seven Canadian provinces. Only South Carolina, Mississippi, Arkansas, Wyoming and Idaho lacked Blue Cross coverage by Jan. 1946. Plans expanded reciprocity agreements to furnish greater care to members hospitalized outside home areas; opened a national enrolment office; adopted more comprehensive contracts increasing the number of days' care allowed each year and adding special services to those already provided; and formulated plans to use Blue Cross as administrative agency in providing hospital care to discharged servicemen in nongovernment hospitals for service-connected conditions. The Veterans' administration requested Blue Cross co-operation to relieve the need for a greatly expanded veterans hospital building program. Michigan led in negotiating such arrangements.

There were 33 nonprofit medical service plans that co-operated during 1945 with 43 Blue Cross plans to provide surgical or medical care to 2,000,000 subscribers. There was a wide increase in employer participation in meeting employees' subscription costs for Blue Cross and affiliated surgical-medical plans. Blue Cross opposed adoption of federal compulsory health insurance proposals but endorsed other phases of the administration's health legislation program.

(A. G. S.)

**Accident and Health.**—Premiums for accident and health insurance and hospitalization increased approximately 15% in 1945 in the U.S., totalling around \$525,800,000. According to the latest available figures, commercial coverage accounts for 25% of the total, hospitalization 3%, group 40%, noncancellable 7%, franchise 2%, monthly premium 5%, weekly premium 9%, limited 5% and unallocated 4%. Federal and state compulsory health measures created some concern. One company group prepared a new manual to aid in writing impaired risks and general attention was being given to the possibilities of underwriting borderline and substandard risks. Attention was also given to setting up standards for franchise insurance, a plan of wholesale insurance for smaller organizations with not enough employees to qualify for group insurance. With the prospects for more civilian flying, broader aviation accident coverage was offered on a world-wide basis. (See also SOCIAL SECURITY.) (C. D. Sp.)

**Great Britain.**—Some changes occurred in accident and miscellaneous insurance during 1945. The restoration of the basic gasoline ration in June led to a great reinstatement of private car insurance, and to a considerable increase in motor premiums, though the 20% war rebate remained in force. Personal accident insurance was in much demand in the early part of the year, as a protection against war risks, and the demand was stimulated by the V-1 and V-2 weapons. After V-E day, however, this business returned to normal. As usual in unsettled times, burglary insurance caused anxiety to insurers. This was particularly so in trade risks handling food or clothing. The proposal to transfer insurance against industrial accidents to the state was further considered. (C. E. G.)

**Fire.**—The primary problem before the business of fire insurance, and in fact before all forms of insurance, was to develop a system of operation which would enable the companies to do business under each of the states. Congress passed a law permitting the companies to have time to make the readjustments up to Jan. 1, 1948. The reason for this law grew out of the decision of the supreme court of the United States, October term, 1943, in which the decision of *Paul v. Virginia*, also by the supreme court, December term, 1868, was overruled. In *Paul v. Virginia* the supreme court held "issuing a policy of insurance is not a transaction of commerce." This decision placed in the several states, and not the U.S., the control of insurance. The decision of '43 overturning this made it necessary to have a complete new set up. By the law granting the companies until 1948 to work out satisfactory adjustments between what the states and the U.S. government would control of insurance was considered a breathing spell. Naturally a great business which had adopted itself to a decision of 1868 could not 75 years later change its methods and practices without the most intense consideration and planning. This was the outstanding problem before the insurance companies.

According to the *Insurance Year Book, 1944*, published by the Spectator company, premium receipts during 1944—the last year for which complete statistics were available—from all forms of underwriting—stock, mutual, Lloyds and reciprocal—amounted to \$1,154,000,000. The total income including interest, rents, etc., amounted to \$1,275,000,000. The losses paid amounted to \$554,000,000 and the total disbursements, including all forms of expenses, amounted to \$1,151,000,000. (See also FIRES AND FIRE LOSSES.) (E. R. H.)

**War Damage.**—War Damage corporation was created as a corporation by Reconstruction Finance corporation on Dec. 13, 1941, with a capital of \$100,000,000 for the purpose of providing insurance protection against damage to property resulting from enemy attack. By public announcement the corporation immediately extended to owners of property in the United States, Alaska, Hawaii, the Philippine Islands, Puerto Rico and the Virgin Islands assurance of reasonable protection, pending future arrangements for coverage under policies of insurance.

By act of congress approved March 27, 1942, Reconstruction Finance corporation was authorized to supply War Damage corporation with funds in an aggregate amount not exceeding \$1,000,000,000, for the purpose of providing through insurance reasonable protection against loss of or damage to property resulting from enemy attack or from the action of the military, naval or air forces of the United States in resisting enemy attack. War Damage corporation placed its program of policy insurance in operation, effective July 1, 1942, and the free protection theretofore effective was terminated on the same date.

To avoid the necessity for creating a complete governmental organization to handle the program the corporation entered into separate agreements with 546 fire insurance companies pursuant to which such companies agreed to act as "fiduciary agents" for the corporation in receiving applications and premiums, issuing policies, and otherwise handling the program. This meant the corporation operated through approximately 1,450 established policy-issuing offices. The insurance agent or broker who submitted the applications received a service fee of 5% of the premium, with a minimum of \$1 per policy and a maximum of \$1,000 per policy. The insurance company through which the application was submitted received an expense reimbursement of 3 1/2% of the premium, with a minimum of 50 cents per policy and a maximum of \$700 per policy, subject to adjustment on the basis of actual costs and expenses. The insurance industry, represented by the 546 participating companies, had a 10% interest in the operating profits or losses of the program, subject to a limit of \$20,000,000. As of June 30, 1945, premiums collected aggregated approximately \$244,900,000, and it was estimated that approximately \$114,000,000 of War Damage corporation insurance was in force on June 30, 1945. More than 8,700,000 policies or renewal certificates were issued by the corporation. Premium rates were uniform throughout the territories covered and vary with types of property, classes of occupancy, and types of construction. This insurance was not compulsory.

Effective Dec. 21, 1942, the corporation made available insurance on money and securities through the facilities of 88 casualty and surety insurance companies likewise acting as fiduciary agents of War Damage corporation. The service fees and expense reimbursement were the same as for the general program, and the participating companies had a similar 10% interest in the operating profits or losses, subject to a limit of \$5,000,000. As of June 30, 1945, premiums from the Money and Securities program aggregated approximately \$980,000, and it was estimated that approximately \$3,000,000,000 of War Damage corporation insurance

covering money and securities was in force under approximately 2,800 policies.

On April 1, 1944, the secretary of commerce and the War Damage corporation made public announcement that insurance duly in effect on March 31, 1944, under policies of the corporation would be extended for an additional term of 12 months from the respective dates of expiration of such insurance without payment of premium or other charge in addition to that theretofore paid. The corporation's premium rates for new or additional insurance remained as published. The extension of insurance thus granted was generally automatic, but insurance companies acting as fiduciary agents of the corporation were authorized, upon request, to execute endorsements evidencing such extensions.

On Feb. 28, 1945, the War Damage corporation made public announcement that insurance duly in effect on Feb. 28, 1945, under policies of the corporation would be extended for an additional term of 12 months from the respective dates of expiration of such insurance without payment of premium or other charge in addition to that theretofore paid. The corporation's premium rates for new or additional insurance remained as published. The extension of insurance thus was generally automatic, but insurance companies acting as fiduciary agents of the corporation were authorized, upon request, to execute endorsements evidencing such extensions.

Pursuant to the provisions of the above-mentioned act War Damage corporation was also authorized to compensate for loss or damage to property sustained during the period from Dec. 6, 1941, to July 1, 1942, without premium or other charge, subject to the limitations prescribed in the act. The corporation investigated and adjusted claims for losses sustained during this period as a result of enemy attack or action of the military, naval or air forces of the United States in resisting enemy attack in the Hawaiian Islands, Alaska and certain other areas within the geographical purview of the act. Practically all of the Hawaiian eligible claims were paid. The Alaskan claims were in process of adjustment and payment, as were certain marine claims. As of June 30, 1945, \$327,500 was paid to compensate for losses sustained during the period from Dec. 6, 1941, to July 1, 1942. Such claims were paid from the funds originally made available to War Damage corporation by Reconstruction Finance corporation and not from premium collections. (H. A. Mu.)

**Great Britain.**—War risk to property on land practically ceased with the end of hostilities in Europe in June 1945, though possible danger from unexploded bombs and similar hazards remained. Under the building scheme, the final instalment of contributions was paid in July, though whether a further levy might have to be made depended on the ultimate cost of repairing the damage. No further premiums were required under the commodity, business and private chattels schemes. War risk insurance at sea was still in demand, but the risk and the rates of premium were much reduced. (C. E. G.)

In a White Paper issued on Dec. 5 it was disclosed that a total of \$804,000,000 (conversion rate \$4.00 to £) had been paid out in claims and expenses up to March 31, 1945, under the board of trade's three war-damage schemes. Under the business equipment scheme \$108,000,000 had been paid and \$244,000,000 "noted" for deferred payment. Corresponding figures relating to the private chattels scheme were \$212,000,000 and \$116,000,000. Under these two schemes claims estimated at \$20,000,000 remained outstanding in each case. The commodity scheme details showed \$484,000,000 paid and claims estimated at \$4,000,000 outstanding. Policies issued totalled 17,500,000 and of some 2,750,000 claims received 97% had been disposed of. (X.)

**Marine and War Risk.**—The year 1945 was a momentous year to marine insurance, as it was to the whole world, for it marked the beginning of the transition from war to peace. War perils do not cease with the end of war hostilities, for risks such as floating mines persist for many months and insurance against war perils continues to be placed. The restoration of normal marine navigation is also a slow process.

In the first few months of 1945 marine and war risk conditions differed very little from those in the last months of 1944 except that the gradual decline in submarine warfare in Atlantic waters and the slackening of Japanese activity in the Pacific were reflected in a gradual reduction of war risk rates. In May following V-E day war risk rates were materially reduced in the Atlantic areas and a similar drastic reduction in the Pacific followed V-J day in August. A gradual reduction in war risk rates in all waters continued for the rest of the year.

Although these reductions in rates caused a fall in the premium income of commercial war risk underwriters, the actual amount and value of cargoes insured by them against war risks increased over 1944, due in part to the complete discontinuance by the War Shipping administration of its cargo war risk writings in midsummer.

The beginning of the transition from war to peace was also felt in marine insurance during the latter months of the year. Ships began to sail without convoy, lights and other aids to navigation were beginning to be restored, and work was started on clearing ports and rebuilding docks, warehouses and transportation facilities. However, in spite of these improvements in navigation and transportation, the basic marine cargo rates were still inadequate to meet shipping conditions and it was necessary to continue additional charges for the marine extension clauses. These charges were reduced from time to time as improvements were felt. Packing conditions were improved very little, if any, and theft and pilferage claims were heavy throughout the year.

Until late in 1945 most of the ocean hull marine insurance business was still insured under the Wartime Hull agreement between the War Shipping administration and the American Marine Hull Insurance syndicate. However, in the latter months of the year tankers which were privately owned and had been requisitioned during the war were released to private owners and marine and war risks insurance on these vessels was arranged in the commercial market. (O. C. T.)

## Inter-American Affairs, Office of.

Operations of the U.S. office for 1945 grouped themselves into two broad classifications—economic development work with related health, sanitation and food supply programs, and informational activities involving the press, radio, motion pictures and education. In turn, operations in these groups were diverted with the military victories of the year from wartime to peacetime channels.

In the basic economy program some 800 health and sanitation projects, developed by the U.S. jointly with governments of 18 other American republics, were directed toward laying solid foundations upon which each country could base its long-range program for better living. These projects included control of malaria and other tropical diseases, drinking water and sewage disposal installations and programs for training medical and nursing personnel. The health and sanitation agreements for co-operative activities were to run through 1947 in ten republics and through 1948 in five of the neighbouring countries.

The food supply program for 1945 was centred in eight republics. Migration of workers to areas of strategic materials production during World War II had aggravated existing food shortages. Agricultural technicians were loaned by the U.S. to the eight republics to combat these and other food production problems in co-operative programs extending in Costa Rica, Haiti, Paraguay, Brazil, Peru and Venezuela through 1946. In Costa Rica, Haiti, Paraguay and Venezuela they were to run through 1947. Following the military victories the co-operative phases of the Brazilian food program were terminated in Aug. 1945, after successfully easing food shortages in the strategic "bulge" and Amazon basin areas of Brazil, where concentrations of troops and migratory rubber and agricultural workers had gathered. Farm demonstration and experimental stations, machinery for the distribution of seed, stimulation of fruit and vegetable growing, storage and transportation facilities, all reverted to the Brazilian government for adaptation to its peacetime program for elevation of agricultural standards. Similarly, three demonstration and experimental farms were turned over in Aug. 1945 to the government of Honduras for continued peacetime operation.

The information activities of the Office of Inter-American Affairs continued to stimulate exchange of all types of information and knowledge to aid mutual understanding and unity among the American republics. Wide distribution was given to news of inter-American significance, articles, news pictures, posters, display placards and pamphlets. An illustrated magazine, *En Guardia*, published in Spanish, Portuguese and French, was distributed upon request to approximately 550,000 people in Central and South America. Radio coverage provided a special inter-American news service 24 hours a day, seven days a week, as well as special programs dealing with the history, culture, resources, war and postwar activities of the other American republics. Wide use of motion pictures, particularly of 16-mm. educational and documentary films, continued during 1945.

By executive order of Aug. 31, 1945, the information activities of the office, including press, radio and motion picture divisions, were transferred to the U.S. department of state, there to become part of the permanent Office of International Information and Cultural Affairs.

The Inter-American Educational foundation, organized in 1943 to develop co-operative programs with the other American republics, was well under way in 1945. By the end of the year agreements among 17 republics were in operation. These agreements called for joint contribution of funds, materials and education specialists, for a comprehensive program of educational interchange.

In the transportation field the Office of Inter-American Affairs conducted advisory functions or field operations in railroad, highway or port operation programs in Mexico, Bolivia, Brazil, Ecuador, Colombia, Venezuela, Paraguay, Peru and Central America. Advice on aviation matters and assistance in procuring aviation equipment was given. During 1945 the office, in collaboration with other governmental agencies and trade associations, sponsored tours of the U.S. by a number of highway and railway officials from the other Americas. Technical help was also given on matters of economic development and advertising.

(F. A. J.)

## Inter-American Conference on Problems of War and Peace.

This conference, which met at Mexico City from Feb. 21 to March 8, 1945, was convened by the Mexican government on behalf of the "united and associated American states" then co-operating in World War II against the axis, in order to consider (1) methods of intensifying their wartime collaboration, (2) arrangements for the strengthening of the inter-American system and its participation in the projected United Nations organization and (3) measures to further postwar economic solidarity in the Americas. The origin of the conference may be traced to the request of the Farrell-Perón government of Argentina, submitted to the Pan American Union on Oct. 27, 1944, that a meeting of American foreign ministers be called to examine Argentina's claim that it had faithfully fulfilled the international obligations undertaken at the Rio de Janeiro conference of 1942. In order to avoid the embarrassing necessity of including Argentine representatives in such a gathering, the other American republics, largely at the instance of the United States, agreed through diplomatic channels to hold a special conference, thus circumventing the regular inter-American consultative machinery. The governing board of the Pan American Union consequently voted to defer Argentina's request since there would be opportunity to deal with it at the Mexico City meeting.

The deliberations of the conference, embodied in 61 resolutions, declarations and recommendations, represent a landmark in the history of Pan-Americanism. Of outstanding significance are the declaration of "Reciprocal Assistance and American Solidarity," called the Act of Chapultepec and the resolution for the "Consolidation, Strengthening and Reorganization of the Inter-American System." Part I of the Act of Chapultepec pledged the signatory states, for the duration of World War II, to consult together in order to agree upon collective measures of restraint, diplomatic, economic or military, against any aggression, whether threatened or overt, from within or outside the Americas. Part II recommended that there be concluded after the war a permanent inter-American treaty embodying similar principles and procedures, but with the proviso that such a treaty should constitute "a regional arrangement for dealing with matters relating to the maintenance of international peace and security as are appropriate for regional action in this hemisphere," consistently with "the purposes and principles of the general international organization, when established." The clear intent of this proviso, which reproduced almost verbatim the language of the Dumbarton Oaks proposals, was to ensure the integration of the inter-American system into the framework of the United Nations organization soon to be launched at San Francisco.

The Mexico City conference also went on record in favour of overhauling the machinery of the inter-American system itself, the participating governments agreeing, *inter alia*, (1) that the regular international conferences of American states should

thereafter ordinarily meet at four instead of five-year intervals, (2) that ordinary meetings of foreign ministers should be held annually and that special meetings might be called in emergencies by vote of an absolute majority of the governing board of the Pan American Union, (3) that the board's membership should in the future consist of *ad hoc* delegates, with an elected, annually rotating chairman, and with functions broadened to include "every matter which affects the effective functioning of the inter-American System and the solidarity and well-being of the American republics," (4) that a permanent Inter-American Economic and Social council should be created to serve as a co-ordinating and promoting agency for inter-American activities and to maintain liaison with the corresponding world organ, and (5) that the governing board should prepare a draft charter for the improvement of the Pan-American system to be submitted to the 9th International Conference of American States at Bogotá in 1946.

Among the other noteworthy accomplishments of the conference was a declaration of principles, the "Economic Charter of the Americas," pledging national and international action for higher standards of living, equality of access to trade and raw materials and the equitable distribution of production surpluses. Shortly before adjournment, the conference made a friendly gesture toward "the Argentine nation" (1) by formally expressing the hope that it would be able to co-operate fully with the United Nations and (2) by inviting it to adhere to the final act of the conference. Reacting favourably to this conciliatory move, Argentina on March 27 declared war on the axis powers and on April 4 subscribed to the Mexico City decisions.

(W. R. Sp.)

### Final Act of the Inter-American Conference on Problems of War and Peace Resolution VIII

#### RECIPROCAL ASSISTANCE AND AMERICAN SOLIDARITY (Act of Chapultepec)

##### WHEREAS:

The peoples of the Americas, animated by a profound love of justice, remain sincerely devoted to the principles of international law; It is their desire that such principles, notwithstanding the present difficult circumstances, prevail with even greater force in future international relations;

The inter-American conferences have repeatedly proclaimed certain fundamental principles, but these must be reaffirmed at a time when the juridical bases of the community of nations are being re-established;

The new situation in the world makes more imperative than ever the union and solidarity of the American peoples, for the defense of their rights and the maintenance of international peace;

The American states have been incorporating in their international law, since 1890, by means of conventions, resolutions and declarations, the following principles:

(a) The proscription of territorial conquest and the non-recognition of all acquisitions made by force (First International Conference of American States, 1890);

(b) The condemnation of intervention by one State in the internal or external affairs of another (Seventh International Conference of American States, 1933, and Inter-American Conference for the Maintenance of Peace, 1936);

(c) The recognition that every war or threat of war affects directly or indirectly all civilized peoples, and endangers the great principles of liberty and justice which constitute the American ideal and the standard of American international policy (Inter-American Conference for the Maintenance of Peace, 1936);

(d) The system of mutual consultation in order to find means of peaceful cooperation in the event of war or threat of war between American countries (Inter-American Conference for the Maintenance of Peace, 1936);

(e) The recognition that every act susceptible of disturbing the peace of America affects each and every one of the American nations and justifies the initiation of the procedure of consultation (Inter-American Conference for the Maintenance of Peace, 1936);

(f) The adoption of conciliation, unrestricted arbitration, or the application of international justice, in the solution of any difference or dispute between American nations, whatever its nature or origin (Inter-American Conference for the Maintenance of Peace, 1936);

(g) The recognition that respect for the personality, sovereignty and independence of each American State constitutes the essence of international order sustained by continental solidarity, which historically has been expressed and sustained by declarations and treaties in force (Eighth International Conference of American States, 1938);

(h) The affirmation that respect for and the faithful observance of treaties constitute the indispensable rule for the development of peaceful relations between States, and that treaties can only be revised by agreement of the contracting parties (Declaration of American Principles, Eighth International Conference of American States, 1938);

EZEQUIEL PADILLA addressing delegates to the Inter-American Conference on Problems of War and Peace at a preliminary session in Mexico City on Feb. 21, 1945. Argentina was not invited, but later accepted the conference's Act of Chapultepec, pledging mutual aid against aggression

(i) The proclamation that, in case the peace, security or territorial integrity of any American republic is threatened by acts of any nature that may impair them, they proclaim their common concern and their determination to make effective their solidarity, coordinating their respective sovereign wills by means of the procedure of consultation, using the measures which in each case the circumstances may make advisable (Declaration of Lima, Eighth International Conference of American States, 1938);

(j) The declaration that any attempt on the part of a non-American state against the integrity or inviolability of the territory, the sovereignty or the political independence of an American State shall be considered as an act of aggression against all the American States (Declaration XV of the Second Meeting of the Ministers of Foreign Affairs, Habana, 1940);

The furtherance of these principles, which the American States have constantly practised in order to assure peace and solidarity among the nations of the Continent, constitutes an effective means of contributing to the general system of world security and of facilitating its establishment;

The security and solidarity of the Continent are affected to the same extent by an act of aggression against any of the American States by a non-American State, as by an act of aggression of an American State against one or more American States;

#### PART I

The Governments Represented at the Inter-American Conference on Problems of War and Peace

#### DECLARE:

1. That all sovereign States are juridically equal among themselves.  
2. That every State has the right to the respect of its individuality and independence, on the part of the other members of the international community.

3. That every attack of a State against the integrity or the inviolability of the territory, or against the sovereignty or political independence of an American State, shall, conformably to Part III hereof, be considered as an act of aggression against the other States which sign this Act. In any case invasion by armed forces of one State into the territory of another trespassing boundaries established by treaty and demarcated in accordance therewith shall constitute an act of aggression.

4. That in case acts of aggression occur or there are reasons to believe that an aggression is being prepared by any other State against the integrity or inviolability of the territory, or against the sovereignty or political independence of an American State, the States signatory to this Act will consult among themselves in order to agree upon the measures it may be advisable to take.

5. That during the war, and until the treaty recommended in Part II hereof is concluded, the signatories of this Act recognize that such threats and acts of aggression, as indicated in paragraphs 3 and 4 above, constitute an interference with the war effort of the United Nations, calling for such procedures, within the scope of their constitutional powers of a general nature and for war, as may be found necessary, including: recall of chiefs of diplomatic missions; breaking of diplomatic relations; break-

ing of consular relations; breaking of postal, telegraphic, telephonic, radio-telephonic relations; interruption of economic, commercial and financial relations; use of armed force to prevent or repel aggression.

6. That the principles and procedure contained in this Declaration shall become effective immediately, inasmuch as any act of aggression or threat of aggression during the present state of war interferes with the war effort of the United Nations to obtain victory. Henceforth, and to the end that the principles and procedures herein stipulated shall conform with the constitutional processes of each Republic, the respective Governments shall take the necessary steps to perfect this instrument in order that it shall be in force at all times.

#### PART II

The Inter-American Conference on Problems of War and Peace

#### RECOMMENDS:

That for the purpose of meeting threats or acts of aggression against any American Republic following the establishment of peace, the Governments of the American Republics consider the conclusion, in accordance with their constitutional processes, of a treaty establishing procedures whereby such threats or acts may be met by the use, by all or some of the signatories of said treaty, of any one or more of the following measures: recall of chiefs of diplomatic missions; breaking of diplomatic relations; breaking of consular relations; breaking of postal, telegraphic, telephonic, radio-telephonic relations; interruption of economic, commercial and financial relations; use of armed force to prevent or repel aggression.

#### PART III

The above Declaration and Recommendation constitute a regional arrangement for dealing with such matters relating to the maintenance of international peace and security as are appropriate for regional action in this Hemisphere. The said arrangement, and the pertinent activities and procedures, shall be consistent with the purposes and principles of the general international organization, when established.

This agreement shall be known as the "ACT OF CHAPULTEPEC."

(Approved at the plenary session of March 6, 1945)

**Inter-American Defense Board.** During 1945 the Inter-American Defense board held 23 plenary sessions and approved and transmitted to the governments of the American republics seven resolutions embodying long-range recommendations for the co-operative defense of the western hemisphere. These included resolutions XVII, hemisphere telecommunications; XVIII, standardization of matériel; XIX, hemisphere-wide census; XX, utilization of manpower; XXI, standardization of organization and training of the armed forces; and XXII, inter-American military co-operation. These resolutions culminated the work of technical committees, and were accompanied by reports supporting and explaining the recommendations. Another recommenda-

tion, resolution XXIII, teaching of hemisphere languages in military schools, was accompanied only by a brief explanatory statement.

The board is an autonomous international organization created in March 1942 in accordance with resolution XXXIX of the third meeting of foreign ministers at Rio de Janeiro. It includes military, naval and air delegates from each of the American republics, and is charged with studying and recommending measures for the defense of the hemisphere. The board's offices and conference rooms are in the new war department building, Washington. Lt. Gen. S. D. Embick, U.S.A., was chairman in 1945.

Two resolutions of the Inter-American Conference on Problems of War and Peace, held at Mexico City early in 1945, had a bearing upon the future of the Inter-American Defense board. Resolution IV proposed the creation of a permanent military agency formed by representatives of each of the general staffs of the American republics, and suggested that the Inter-American Defense board be continued pending the implementation of this recommendation. Resolution IX, which dealt with the reorganization and strengthening of the inter-American system, recommended that the board continue to function until its future could be considered by the International Conference of American States, scheduled at Bogotá, Colombia, in 1946.

## Interior Decoration.

Materials of all kinds used in interior decoration were scarce and difficult to obtain in 1945. This scarcity was mainly the result of labour shortages and the slowness with which reconversion from war to peacetime production progressed. Large-scale production for civilian goods was not expected to be back on a peacetime basis until 1946-47.

New ideas, designs and plans, however, were being studied and worked out in order to be ready for future production. The public was being prepared for these new designs in living through advertising, the release of sketches and small-scale models or samples of what was later to be put on the market.

New processes for making materials of all kinds more durable and easier to clean, as well as to retain or improve their attractiveness, were being developed. An example of this was a non-inflammable spun glass which was woven into fabrics for curtains and furniture coverings.

Processes for bending and shaping woods continued to develop. Designers of furniture had been working on this method of creating furniture since it simplifies form, labour and construction, and lowers cost. The public had to be educated to contemporary designs of living in related products, as well as other fields, before this process could develop profitably.

**Wall Treatment, Interior Trim and Floors.**—Walls were painted, generally in light colours, papered in gay stripes, plaids, florals, or scenic patterns and wood panelled of evenly grained thin veneers mounted on wallboard. Acoustic-tile, a soundproofing material, was an excellent wall and ceiling covering for offices and industrial plants. With fabrics stretched or draped over the acoustic-tile this soundproofing effect was also adapted to homes and executive or specialized offices, such as radio testing departments. Woodwork was painted in white or cream colour as a contrast to painted walls of a stronger colour, in the same colour as the walls, or was of the same wood as the panelled walls. Floors were hardwoods or tile.

**Floor Coverings.**—The carpet industry was one of the civil-

SECTION of the 2-story-high reception room in the penthouse completed in 1945 for Reynal and Hitchcock, New York publishers. Jedd Stowe Reisner was the designer

ian industries more critically affected by wartime material and labour shortages, and there were very few new rugs and carpets made during 1945. Those floor coverings that were made were produced in a limited colour range, were generally plain, without pattern, and materials which went into them were of cotton, linen, wool or felt. Oriental, Aubusson and other hand-loomed rugs available through importers and antique dealers were in great demand, along with the boom in the antique trade of other related furnishings, which resulted from small volume production, at its peak in 1945.

**Window Treatment.**—These were the most common treatments: the draw curtain across single or double windows or the entire window wall; panels at either side of windows with or without cornices across the top, covered in the same fabric as panels or painted; crisscross ruffled curtains. Curtain fabrics on the market were plain and printed spun glass, rayon, nylon and cotton casement cloth, rayon and/or nylon and cotton mixture plain and printed cloth, some with textured and others with flat surfaces.

**Furniture.**—The furniture that was made was generally in one of two categories, either reproductions of traditional designs or low cost contemporary designs. The latter were adaptable for offices, service men's and women's recreational buildings, hospitals and low cost housing projects. Antique furniture was very much in demand because of the limited production of the first category.

**Furniture Coverings.**—Leather and leatherette were allowed for civilian use for repair and maintenance of commercial furniture. Limited quantities of cotton, wool or rayon damask, tapestry, brocade, plain textures and prints were practically fought over at store counters—they were so scarce. Yarns and weavers were at a premium. One weaver employed the use of almost every known substitute for yarns in creating fabrics: among them, cellophane, lucite, metallic threads and leather strips.

**Decorative Accents.**—Decorative accents conformed to both the modern and the traditional. The artisans as well as patrons were becoming more interested in modern design, where previously traditional was thought to be the only way to decorate interiors.

(G. M. J.)

**International Bank for Reconstruction and Development:** see BANKING; UNITED NATIONS MONETARY AND FINANCIAL PROGRAM.

**International Court of Justice:** see UNITED NATIONS CONFERENCE ON INTERNATIONAL ORGANIZATION.

**International Labour Conference:** see INTERNATIONAL LABOUR ORGANIZATION.

**International Labour Organization.** Of the twenty-six years of international service for the International Labour organization none was more critical or more productive than 1945. The San Francisco conference of the United Nations organization (U.N.O.) (April-June 1945) adopted a charter, signed by representatives of 50 governments. A tripartite delegation of the governing body of the I.L.O. attended the conference. Without any formal declaration, the way was left open to make the I.L.O. an autonomous special agency, within its sphere, of the Economic and Social council of the U.N.O.

The I.L.O. activities of 1945 included meetings in London (January-February) of the governing body, 94th session; joint maritime commission, 14th session; committees on employment, constitutional questions, finance and standing orders; experts on proposed model safety code for factories; experts on social insurance. Experts on the protection of children and young workers met in Montreal, Canada, in May. The governing body, 95th session, met in Quebec in June, as well as the same four committees which met in January in London. Special tripartite committees of the joint maritime commission, and experts on the application of conventions, met in London, England, in July; the International Labour conference, 27th session, and the governing body, 96th and 97th sessions, met in Paris, France, in October; the Accident Prevention committee in Montreal in November; the Maritime Technical Preparatory conference in Copenhagen, Denmark, in November, the Coal Industry and Inland Transport committees in London in December.

The I.L.O. staff and experts made substantial contributions to the governments of member states by visits on request in aid of social legislation and administration; and by attendance at conferences of the United Nations Relief and Rehabilitation administration; the Inter-American Committee on Social Security (Mexico City, Mexico, Feb. 1945) and the Third Inter-American conference of Agriculture (Caracas, Venezuela, Aug. 1945).

Research and publication included the collection of firsthand, world-wide information, some from belligerent countries, much inaccessible even to governments in peacetime. Much of this information was communicated in the six reports<sup>1</sup> to the International Labour conference, and the eight reports<sup>2</sup> to the Maritime Technical Preparatory conference, aggregating 1,500 pages, which in the judgment of competent observers, were alone worth more than the total cost of the I.L.O. for the entire year—about \$2,500,000.

Important monographs published during the year included: *Social Security for Seafarers* (Studies and Reports, M-19); *The Exploitation of Foreign Labour by Germany* (286 pp., S. & R., C-25); *The Cooperative Movement and Present-Day Problems*, with special reference to rehabilitation and reconstruction (232 pp., S. & R., H-5); and in co-operation with the Inter-American committee, *Inter-American Hand Book of Social Insurance Institutions* (187 pp.). The serials appeared regularly: *The International Labour Review* (monthly); *Legislative Series* (quarterly); *Industrial Safety Survey* (quarterly); *Year Book*

*of Labour Statistics*; *Official Bulletin*; *Minutes of the Governing Body*; *Conference Documents*; *Questionnaires and Reports*, *Final Record of Proceedings*, texts of Draft conventions and Recommendations of International Labour conferences.

Ratifications of conventions, scarcely to be expected under world-war conditions, were increased by Peru's ratification of 11 conventions in Nov. 1945, making a total of 913 ratifications of the 67 conventions adopted after 1919, with 51 countries having ratified one or more.

A significant new departure in I.L.O. work was inaugurated by the governing body in setting up tripartite international committees for a number of the principal industries: inland transport, textiles, coal mining, iron and steel production, metal trades, petroleum production and refining, building, civil engineering and public works.

The 27th session of the International Labour conference which met in Paris, France, in October was the outstanding event of 1945. Forty-eight member states were represented by 470 delegates and advisers, as compared with 360 in Philadelphia, Pa., in 1944. One new member, Iceland, and two reinstated members, Italy and Guatemala, were admitted. Important statements pledging wholehearted support were made by the governments of the U.S.A., Great Britain, France and other countries. The I.L.O. constitution and procedures were amended to co-operate with new international agencies. The U.N.O.'s power to co-ordinate the activities of specialized agencies was welcomed, and it was felt that the Economic and Social council would reinforce the I.L.O. and provide the means to secure the application of its decisions.

The conference not only adopted an instrument of amendment, making important amendments effective when ratified by three-fourths of the members, but also established a delegation on constitutional questions—the working party—to meet in London in January 1946 and remain in session until it had prepared a report recommending all necessary changes in the constitution for action by the next conference (Montreal, Sept. 19, 1946). The governing body was empowered to negotiate relations with the U.N.O. and the Economic and Social council, and other international agencies. The conference adopted no new conventions but several resolutions, and one draft recommendation on minimum standards of social policy in dependent territories (supplementary provisions) 1945, aimed to give native labourers the protection of collective bargaining, minimum wage legislation, etc. The governing body put this subject on the agenda of the next conference for "first discussion" of a convention. (See also CHILD WELFARE; LEAGUE OF NATIONS.)

(S. McC. L.)

**International Law.** The year 1945 was one of the most important years in international law and relations. It marked the termination of World War II; the Yalta, Potsdam, London and Moscow meetings of the Big Three (U.S.S.R., Great Britain and the United States); the meetings for the organization of a new league, such as Dumbarton Oaks, San Francisco, United Nations organization in London, not to speak of the Chapultepec Conference of the American States meeting at Mexico, as well as the re-establishment of the Court of International Justice following the lines of the former court.

**Atomic Bomb.**—During 1945 the atomic bomb was perfected and used on Hiroshima and Nagasaki, Japan. It held such a threat for civilization that a world organization to control the atomic bomb became an indispensable device for mankind's self-preservation. This might be the beginning in the surrender of national sovereignty. But control must be regulated and be made effective if mankind is to survive.

<sup>1</sup> *Director's Report*; *Maintenance of High Levels of Employment during the Period of Industrial Rehabilitation and Reconversion*; *Protection of Children and Young Workers*; *Matters Arising out of the Work of the Constitutional Committee*, Part 1, "The Relationship of the I.L.O. to Other International Bodies." Part 2, "Revision of the Form and Arrangement of the Standing Orders of the Conference"; *Minimum Standards of Social Policy in Dependent Territories and Supplement*; *Reports on the Application of Conventions and App.*

<sup>2</sup> *Wages, Hours of Work on Board Ship, Manning, Leave, Accommodation on Board Ship*; *Food and Catering*; *Recognition of Seafarers' Organizations*; *Social Insurance*; *Continuous Employment*; *Entry, Training and Promotion of Seafarers*.

**War Criminals.**—As a result of World War II a great tribunal composed of Russians, Americans, British and French was set up at Nuernberg to try about 20 leaders of the Nazi party in Germany. In so far as they were responsible for war atrocities which are violations of the rules of war, possibly no objection could be raised. In so far as they were tried as responsible for the outbreak of war or acts against their own nationals, the precedent appeared to be highly questionable. It might have been better to subject them to political penalties. Any punishment as "aggressors"—chameleonic term—might mean that in future wars the leaders of the losing party would be liable to be liquidated. In addition to the Nuernberg trial, numerous trials of individual Nazis were undertaken by the several countries whose nationals were maltreated. This was in addition to trying their own collaborationists. Allied authorities also tried war criminals. The fact that neutrals were asked to surrender war criminals indicated that they would not be allowed to give refuge to proved war criminals. But they remained the judges as to whom they would surrender.

**Neutrality.**—Pressure was brought to bear on Switzerland and other neutrals to prevent the flight of Axis capital and the secretion of Axis assets and looted property. The neutrals apparently had frozen all German assets directly or indirectly held; prohibited earlier the import and export of all foreign currencies and the purchase of gold from Germany. Switzerland stopped the shipment of coal to northern Italy across Switzerland, and reduced its exports to Germany. In return, the Allied governments agreed to allow importation into Switzerland of various foodstuffs and raw materials.

On the question of asylum to be granted to accused war criminals and the responses made to Allied demands for surrender, see Dept. of State *Bulletin*, Feb. 11, 1945, p. 190.

The United States admitted responsibility to Switzerland for the accidental bombing of Swiss towns on Feb. 22 by U.S. aircraft. This was in keeping with the general practice.

On the request of the Allied governments that the neutrals surrender German private property, there was some hesitation to yield to this impairment of neutral sovereignty. A similar demand was authorized by the Treaty of Versailles but not honoured. It remained to be seen whether the Allied governments would try to use sanctions for such an unusual request.

The U.S. administration sought during 1945 to bring pressure on the Franco government in Spain. The president wrote the U.S. ambassador that Spain was not approved. This was dangerous policy, since it foreshadowed either intervention or retreat (*Bulletin*, Sept. 30, 1945, p. 466).

**World Organization.**—The effort to organize the world along new League of Nations lines was pursued at various conferences. The Dumbarton Oaks draft was slightly changed at San Francisco, but reflected the central theory for the United Nations organization, known as U.N.O. Its principal organ was a security council of 11 in which each of the Big Five (U.S.S.R., Great Britain, the United States, France and China) retained a veto power. It seemed probable, therefore, that the organization would never be able to act against one of the Big Five, for which reason many regarded the organization as unimportant. The assembly of fifty-one nations had recommendatory powers but only the security council had decisive powers. Possibly the economic and social council directed by the assembly would have a useful sphere of operation. (See also UNITED NATIONS CONFERENCE ON INTERNATIONAL ORGANIZATION.)

**Private Property.**—The most serious inroads upon this institution are found in the Potsdam declaration, which authorized each United Nation to confiscate German foreign assets. In addition, reparations were obtained by the U.S.S.R. in eastern

Europe out of 25% of the industrial property which could be removed. Of the 25% in western Europe, 10% was to go to the U.S.S.R. in return for foodstuffs, and the rest to the other Allied countries. In addition, munition plants were being or were to be destroyed or carried away. This was in addition to the looting of private property which was in process.

On Dec. 28, 1945, the U.S. alien property custodian announced his intention to wipe out Japanese and German economic power in the U.S. It was difficult to see how under this dispensation foreign investment and, indeed, the institution of private property had a chance of long survival. This was completely in violation of international law, whose wise injunctions of 400 years had been disregarded.

In addition to the private property to be taken, a sum was to be assessed upon diminished Germany as reparations (*Bulletin*, March 8, 1945, p. 434; *New York Times*, Dec. 4, p. 11; Dec. 22, p. 7; Dec. 24, p. 7; Dec. 28, p. 3).

**Petroleum.**—An Anglo-American oil agreement concluded as an executive agreement in 1944, was withdrawn at the request of the Foreign Relations committee of the senate by the president of the U.S. in Jan. 1945, for renegotiation as a treaty with Great Britain. This was designed to avoid unfair competition in obtaining petroleum concessions by nationals of the U.S. and Great Britain. A petroleum board's recommendations, which originally were to be conclusive, were made recommendatory only. The treaty was still pending in the senate in Dec. 1945.

**Pearl Harbor Attack.**—During 1945 the reports of the army board and the navy board were published. The former blamed Secretary Cordell Hull for giving an ultimatum to Japan which precipitated World War II. This was strongly denied by the departments of state and war. Congress was still investigating Pearl Harbor at the end of the year.

**Continental Shelf and Fisheries.**—On Sept. 25, 1945, two important claims were advanced by the president of the U.S. In one proclamation he announced that all the natural resources on the continental shelf to a place where it showed a depth of 100 fathoms or 600 feet were claimed by the U.S., and in another he claimed that all fisheries developed by U.S. industry no matter how far the fish go out to sea, were claimed by the U.S. Since subsoil minerals to at least 20 miles or so had been claimed by the riparian state, the president's claim merely extended the area to the whole of the continental shelf up to 100 fathoms depth. Resources had not yet been discovered in this area beyond three miles out in Jan. 1946, nor did the president seek to foreclose the question whether the state or the nation had the better claim to these resources. The fisheries claim differed only slightly from the claim defeated in the fur seal arbitration—that the U.S. could lay claim to the taking of seals by virtue of the fact that they spawned on the Pribilof Islands, Alaska. Spawning is not sufficient, therefore; but if U.S. citizens developed the industry it furnished a new ground of claim to U.S. jurisdiction.

**Government Immunity.**—In *Mexico v. Hoffman*, 324 U.S. 30 (1945), the immunity granted to a foreign vessel owned by a foreign government was extended only to such vessel when in the possession or service of the foreign government and not to a vessel merely owned by that government. If the government, therefore, charters the vessel to private interests, it loses its immunity in the U.S. courts.

**Lend-Lease.**—The Lend-Lease Act of March 11, 1941, under which more than \$35,000,000,000 of United States property was handed to various cobelligerents of the U.S., was terminated with the end of World War II on Aug. 21, 1945 (*Bulletin*, Aug. 26, p. 284).

**Armistices.**—During 1945 the terms of the armistices with

the various countries of eastern Europe, including Italy, were published.

**Intervention.**—During 1945 there was some demand that the U.S. should intervene in local governments if they were disfavoured and seemed to foreshadow aggression. This is directly contrary to the nonintervention which heretofore prevailed in Latin America. Uruguay in December proposed multilateral intervention against governments meeting joint opposition. While officials of the state department expressed approval, it was uncertain whether other Latin American countries would support the move. A London-Paris agreement looked to ending intervention in Syria and Lebanon by the removal of British and French troops from that area.

**Control of Germany.**—A German government was terminated and if any government then existed there it was the Allied Control council, a four-power government conducted by representatives of Great Britain, the U.S.S.R., the United States and France. Germany was divided into four zones, as was Austria later, administered respectively by nationals of one of the above countries. They were to co-ordinate their policy and needed unanimity for collective decisions. An eventual German government by Germans was contemplated. By the end of 1945 the condominium was not successful and much complaint was heard.

**Nationalization.**—The British Labour party carried out its campaign promises to nationalize the Bank of England and the coal mines and possibly other property. France nationalized the Bank of France and four other private banks, having previously nationalized the munitions industry. Other industries were likely to be nationalized as well. This followed the pattern laid down in Poland and Czechoslovakia. It seemed that it would probably be followed by most of Europe.

**Conscription.**—The president of the U.S. renewed his demand for some form of military conscription, which might indicate apprehension of national danger. The demand was greatly opposed by various interests in the U.S. It was expected to be settled during 1946.

**Foreign Policy.**—In October 1945, in his Navy day address, the president restated the foreign policy of the U.S. It appeared to be difficult to know how this policy would be interpreted in specific cases. (See also PRISONERS OF WAR.) (E. Bd.)

**International Monetary Fund:** see UNITED NATIONS MONETARY AND FINANCIAL PROGRAM.

**International Stabilization Fund:** see BANKING.

**International Trade.** Important developments in world trade occurred in 1945. Even before V-E day the Allies began plans for the relief of war-devastated areas and the reconstruction of world trade. U.N.R.R.A. started operations on a small scale in Sept. 1944, although not until June 1945 did its monthly scale of operations reach eight figures. In April, representatives of 51 nations met at San Francisco to plan the formulation of a United Nations organization for peace. The importance of unhampered world trade to the successful maintenance of peace was recognized in the various staff discussions.

Meanwhile the United States relaxed a few import-export controls on July 5, and on Sept. 20 many of those that remained. U.S. trade with Germany and Japan was prohibited; trade with "Group E" countries<sup>1</sup> remained subject to specific license control. In addition exports of a limited number of commodities still in short supply (termed the "positive" list) were subject to specific license for shipments valued above stated amounts re-

gardless of the country of destination. The lend-lease agreements were terminated Aug. 21. Later the U.S. Export-Import bank made loans to some countries to finance lend-lease shipments approved but not contracted for by the termination date.

Early in December a proposed U.S.-British loan agreement was announced. If ratified by congress, this agreement was to provide for the elimination of exchange control and discriminatory tariff restrictions on the flow of trade between the U.S. and the United Kingdom. Simultaneously plans were announced for a conference of all nations in the summer of 1946 to establish an International Trade organization. A "charter" presenting rules for the conduct of world trade was offered by the U.S. for consideration by other countries. Earlier conferences with some 15 leading trade powers were planned by the U.S. to consider revisions of the reciprocal trade agreements. On Dec. 27, the Bretton Woods monetary agreements were signed by 29 of the 44 nations that drafted them.

At the end of 1945, however, several important prewar trading areas remained closed to the free flow of trade. Enemy countries, of course, continued under Allied army occupation. Open fighting or an armed state of truce existed in several other areas. In many war-devastated regions transportation, communication and harbour facilities remained inadequate and production was still far below prewar levels.

**New Statistics Available.**—For the first time after World War II began, data on the foreign trade of many leading countries became available for publication. This permits comparisons between countries and estimates of total world trade not previously possible. The summary of international trade presented here is largely confined to an analysis of developments during 1945 in the trade of the leading countries for which statistics are available.<sup>2</sup> Some indication is given of prewar world trade and the progress made during the last half of 1945 in the reconversion of world trade from wartime channels.

Tables that show the growth and country composition of trade during the years 1936-45 for the U.S., United Kingdom, Canada and the Latin American republics are given (Tables

<sup>1</sup>Chief among these were Argentina, Austria, Bulgaria, Korea, Hungary, Rumania, and Spain.

**Prewar World Trade.**—Before World War II, the world's total trade averaged approximately \$47,000,000,000 annually. Twenty-five countries accounted for four-fifths of this total. The United Kingdom was first in imports and second in exports, to place first in total foreign trade. Although the U.S. ranked first in exports, relatively lower imports gave it second rank in total trade. Germany, France and Japan were third, fourth and fifth, respectively. Canada, recovering from the great depression, already regained sixth place.

A great variety of goods entered into prewar international trade. Nearly every conceivable product was represented. Over half of the trade, however, was concentrated in a relatively limited number of commodities, about 20, comprising foodstuffs, raw materials and manufactured goods. Principal foodstuffs included wheat and wheat flour, sugar, butter, coffee, meat, tea and rice. Cotton, coal, crude petroleum, gasoline and fuel oil, wool, tobacco, copper and rubber were the raw materials which led in total value of trade. Among the more important manufactured goods were machinery, iron and steel mill products and their manufactures, textile fabrics, chemicals, automobiles, and paper and paper manufactures.

**Wartime Trade of the Allies.**—The wartime roles of the various countries are reflected in their foreign trade for the years 1939-44 (Table III).

The activities of the U.S. and Canada on the production front were spotlighted by tremendous increases in their foreign trade. While part of the rise was because of price increases—the U.S. department of commerce estimated an average rise of 24% for 1939-44, as compared with the 1936-38 average—the physical quantities of exports and imports combined of both countries rose by roughly 50 to 60%. The United Kingdom's export-import trade, on the other hand, declined considerably. Imports rose, but not enough to offset the decrease in exports. This was in keeping with Britain's proximity to European fighting fronts and its specialization on munitions production in accordance with the lend-lease agreements. Since prices rose, the decline in physical quantities was even greater than is shown by the value data.

Shipments to United Kingdom armed forces abroad are excluded in all years. ‡Domestic exports; general imports. §Less than £500,000. ¶Included with "Other countries."

The Latin American republics contributed raw materials and food in increasing amounts, especially after merchantship construction bottlenecks and the submarine menace were conquered in 1942-43. Because of the tight supply situation, however, imports of these countries remained at prewar levels, or below, except for 1944.

The effects of the war in the Pacific on the foreign trade of far eastern countries are less clearly portrayed in the statistics. The foreign trade of Australia and New Zealand showed little change in dollar value. The slight increase in Australian trade was all in imports; exports were considerably below prewar levels in most years. The total trade of British India declined, exports more than imports. Like the United Kingdom, these countries were closer to fighting fronts than western hemisphere countries, so their trade reflected the effects of intensive defense preparations and lend-lease imports.

During 1945 trade between the Allies continued until V-E day much as it had in previous war years. U.S. shipments of military equipment to the Allies continued the slow decline begun in the last half of 1944 after completion of preparations for D-day. The chief new development was the reopening of trade on a limited scale between liberated countries on the continent and the U.S., United Kingdom, Canada and the Latin American republics. During the first half of 1945 exports of the United Kingdom and the western hemisphere countries to eight liberated coun-

tries<sup>3</sup> amounted to \$440,000,000. Over half of these were from the U.S. Imports from these liberated countries were negligible—perhaps \$15,000,000—largely into the United Kingdom.

**Reconversion.**—The last half of 1945 was characterized by the strenuous efforts of all countries to reconvert their foreign trade as well as their domestic production to peacetime channels. For the U.S. this involved the elimination of lend-lease and the restoration of commercial exports. By November the contraction of exports resulting from the termination of lend-lease was nearly completed. Increased U.N.R.R.A. and private relief shipments<sup>4</sup> and an expansion of commercial trade brought exports to a total well above the October figure. In contrast, total imports continued relatively steady throughout the year.

The foreign trade of the United Kingdom reflected the termination of the lend-lease agreements on the import side, and on the export side the re-establishment of trade with the continent. Although total trade declined in the last half of the year, the decline was all in imports. Exports to all areas increased, especially to continental Europe and Latin America.

Canadian exports, like those of the U.S., went through a process of contraction after the cessation of hostilities. This was a result of Canada's wartime role as a producer of munitions and food for the Allies. The re-

duction was confined to exports to the United Kingdom and the U.S. Exports to other countries including Latin America and continental Europe increased. On the import side, the receipt of munitions components from the U.S. declined. Both the import and export trade of the Latin American republics increased after V-E day to set new records for the year. Renewed trade with continental Europe was an important factor in both increases. Trade with the United Kingdom also increased, although reduced shipments in the early months of 1945 kept the year's totals below those of most previous war years.

**World Trade At Year's End.**—By the end of 1945, total world trade in dollar values declined to an estimated monthly rate of about 75 to 80% of the prewar average from 1936-38. Since prices rose around 50%, trade

<sup>3</sup>Belgium, Czechoslovakia, Denmark, France, Netherlands, Norway, Poland, Yugoslavia.

<sup>4</sup>Shipments to armed forces abroad are excluded from foreign trade statistics by most countries. Since the Allied armed forces did considerable relief work, the relief picture is not adequately covered by foreign trade statistics.

in physical quantities was only about half that of prewar years. Shipments of military equipment were reduced to regular peacetime levels. But trade in many foodstuffs, raw materials and manufactured goods, although increasing, had not regained prewar levels.

Moreover, the concentration of this trade between the U.S., the United Kingdom, Canada and the Latin American republics was, in itself, evidence of the gigantic problems ahead in relief and in the reconstruction of trade for the balance of the world (Table VII). The value of the trade of these countries with each other in the fourth quarter of 1945 was almost double its quarterly rate in the years 1936-38. Even in physi-

world production and the improvement of the economic well-being of all peoples through a world trade increased by the removal of international commercial discrimination. (W. L. C.)

**Interstate Commerce Commission.** The duties and powers of the Interstate Commerce commission are set forth in the Interstate Commerce act, as amended. That act is divided into four parts and deals with the regulation of rail, motor and water carriers and freight forwarders. The regulatory powers of the commission extend, among other things, to the charges made by these carriers for transportation services; to questions involving the financial reorganization of railroads; the issuance of securities; to the acquisition or control of these various carriers by other carriers or persons; to their accounting practices and the abandonment of lines of railway; and to matters involving the determination of whether public convenience and necessity require the institution of new services by motor and water carriers or by freight forwarders, or for the construction and operation of new lines of railway.

The membership and organizational plan of the commission did not change materially during 1945 nor did its statutory powers and duties. John L. Rogers was selected by its members as chairman, to serve in that capacity for the year. Two of its members, Charles D. Mahaffie and J. Haden Alldredge, were reappointed by the president to serve additional terms as commissioners. Commissioner J. Monroe Johnson continued as director of the Office of Defense Transportation (*q.v.*), devoting most of his time to the business of that office but acting in his capacity as a member of the commission in cases where his action was necessary to break a tie decision.

The various carriers subject to the jurisdiction of the commission experienced their most difficult year from the standpoint of physically conducting transportation. War traffic moved in unprecedented volumes. With cessation of hostilities in Europe, the redeployment of troops to the Pacific area, followed by the surrender of Japan and widespread demobilization, all facilities of transport were taxed beyond capacity. Transportation was conducted under the most difficult circumstances, the result of equipment and manpower shortages and poor maintenance because of the lack of repair and replacement parts. The movement of troops required restrictions on civilian travel. All records for passenger travel in the United States, by public facilities of transport, were believed to be broken during the Christmas holidays of 1945. This unprecedented volume of freight and passenger traffic necessitated the constant vigilance of the Office of Defense Transportation and required emergency regulations. The commission continued to work with that office in the promulgation and administration of these emergency measures.

One of the outstanding decisions in 1945 involved an investigation into the various railroad freight classifications in effect throughout the U.S., and the various systems and levels of class rates in effect in the territory east of the Rocky mountains.

BIBLIOGRAPHY.—*Class Rate Investigation, 1939, 292 I.C.C. 447.* (J. L. R.)

**Intestinal Disorders:** see ALIMENTARY SYSTEM, DISORDERS OF.

**Intoxication, Alcoholic.** The year 1945 continued to witness a need for formulating and making effective more concerted public policies for the amelioration or correction of chronic drunkenness. Such policies touch on the social and cultural outlook of a people. In a more specific sense they embrace legislative control measures governing the manufacture, distribution and sale of alcoholic beverages.

Table VII.—Combined Trade of the United States, United Kingdom, Canada and the American Republics, Prewar and Postwar

(Monthly rates in millions of dollars)

Destination or origin	1936-1938	1st half	1945 3rd Quarter*	4th Quarter*
Total exports . . . . .	680.2	1,591.8	1,385.7	1,227.7
To each other . . . . .	305.6	874.1	723.7	610.4
To rest of world . . . . .	374.6	717.7	662.0	617.3
Russia . . . . .	5.8	245.0	115.0	75.0
Other . . . . .	368.8	472.7	547.0	542.3
Total imports . . . . .	770.6	1,039.3	1,018.0	941.3
From each other . . . . .	319.2	766.3	706.3	608.0
From rest of world . . . . .	451.4	273.0	311.7	333.3
Russia . . . . .	11.3	7.7	6.0	4.0
Other . . . . .	440.1	265.3	305.7	329.3

\*Partly estimated.

cal quantities both exports and imports rose by some 30%. Their trade with the rest of the world (excluding Russia) contrasts sharply with this. The value of their exports rose above the 1936-38 average in about the same proportion as prices. Thus exports in physical quantities were only at prewar levels, despite the urgent demand for increased shipments to meet relief, rehabilitation and reconstruction needs.

The disorganization of production and transportation outside of the western hemisphere and the United Kingdom is further emphasized by the 25% decline in the value of imports of the U.S., the United Kingdom, Canada and the American republics from other countries. In physical quantities the reduction from the prewar average was more than 50%. However, some revival of trade with continental Europe and countries elsewhere did occur during the last half of 1945. In the fourth quarter of 1945 exports of the selected countries to the rest of the world were 15% higher than the quarterly average for the first half of the year. Imports were 24% higher. Meanwhile trade of the western hemisphere countries and the United Kingdom with each other declined from the first six months because of reduced shipments of munitions, components and war materials. (See also BUSINESS REVIEW; FOREIGN ECONOMIC ADMINISTRATION.) (P. Ws.)

**U.S. Trade Agreements.**—Under the authority of the Trade Agreements act of 1934, which congress renewed four times, the United States concluded 32 reciprocal trade agreements with 28 countries.

These agreements provide for the reciprocal reduction and other concessions in customs duties on commodities listed in the schedules of the agreements, for the reduction and elimination of other forms of trade barriers, and for equality of treatment for the trade of the signatory countries. Through application of the unconditional most-favoured-national principle long followed by the U.S., concessions granted by the U.S. in each agreement are automatically extended to all countries which do not discriminate against the trade of the U.S.

In the order of signing the 29 countries with which trade agreements were concluded were: Belgium, Bolivia, Brazil, Canada, China, Colombia, Costa Rica, Czechoslovakia, Ecuador, Egypt, Ethiopia, France, Greece, Guatemala, Honduras, Iceland, India, Iraq, Luxembourg, Netherlands, Norway, Paraguay, Philippine Commonwealth, Poland, Union of South Africa, United Kingdom of Great Britain and Northern Ireland, United States of America, Uruguay and Yugoslavia.

In 1945, the Trade Agreements act was extended for a three-year period from June 12, 1945, with increased authority to modify customs duties. In accordance with its provisions, rates of duty may be modified by 50% of the rates existing on Jan. 1, 1945. (Under the original act enacted in 1934 and renewed for three-year periods in 1937 and 1940, and for a two-year period in 1943, the authority to modify rates of duty was limited to 50% of the rates of duty existing when the act was first passed.)

After the reciprocal trade agreements program was adopted, substantial progress was made towards reducing and eliminating trade barriers and reopening the markets of the world to commerce. Owing to the exigencies of the war, however, the major trading nations of the world were compelled to utilize commodities, material and shipping to a maximum for the prosecution of the war.

In Dec. 1945, the United States issued its "Proposals for Expansion of World Trade and Employment."

Fifteen countries were invited to participate in a preliminary meeting. They are: Australia, Belgium, Brazil, Canada, China, Cuba, Czechoslovakia, France, India, Luxembourg, the Netherlands, New Zealand, the United Kingdom, the Union of Soviet Socialist Republics, and the Union of South Africa.

The "Proposals for Expansion of World Trade and Employment" were issued by the U.S. as a basis of discussion at the two suggested international conferences. The proposals are comprehensive. They cover trade barriers and restrictions that result from governmental policies and those imposed by private business organizations. They also deal with special problems concerning certain commodities that move in large volume in international trade, and with the structure of a proposed International Trade organization.

The fundamental objectives of the proposals are the expansion of

These were predicated largely upon moralist, profit and revenue motivations that obscure the medical, health, sociological and economic significance of the abusive uses of alcohol.

Other but equally important measures embrace the adoption of adequate provisions for the community supervision of chronic alcoholics, including such matters as the technique of police and court procedure; those involving facilities for medical diagnosis, supervision and treatment; and the need for financial assistance and for job and social placement for the individual involved.

Significant in these regards was the appearance in the United States of the "Report of the Research Council's Studies on Problems of Alcohol," the announcement of the organization of the National Committee on Alcohol Hygiene, Inc. and the issue of its bimonthly publication. The year witnessed a decrease in France of deaths from cirrhosis of the liver and the occurrence of alcoholic psychoses, following the inauguration of restrictive measures on the sale and uses of wine and other alcoholic beverages.

Further reports on electroencephalographic studies continued to reveal no abnormalities resulting from the prolonged uses of alcohol when uncomplicated by a psychosis. Abnormalities exist during the course of delirium tremens and particularly in the Korsakoff's syndrome.

Further observations were made upon the value of insulin administration as a rapid method of treatment for situations arising from an alcoholic debauch.

On the clinical aspects of alcohol ingestion a word of caution was given against mixing caffeine-containing and alcohol-containing beverages by persons predisposed to peptic ulcer. Alcohol or caffeine alone are considered as stimulants to gastric secretion. When taken together they act synergistically through the liberation of histamine. (See also LIQUORS, ALCOHOLIC.)

**Inventions:** see PATENTS.

**Investment Banking:** see BANKING.

**Iodine.** The only information available on the production of iodine in the United States was that during World War II the output was much higher than the 299,286 lb. reported in 1937. Large accumulated stocks led to some decrease in output in 1944, while imports from Chile were 1,204,303 lb., against 2,744,930 lb. in 1943. (G. A. Ro.)

**Iowa.** A north central state of the United States, admitted as the 29th state on Dec. 28, 1846; popularly known as the "Hawkeye state." Area, 56,280 sq.mi., of which 294 sq.mi. are water. The population in 1940 was 2,538,268 with 1,084,231 listed as urban and 1,454,037 as rural. Only 16,694 were Negroes, and of the white population only 117,245 were foreign-born. In 1944 the population was officially estimated to be 2,269,759. The principal cities are: Des Moines, the capital (159,819); Sioux City (82,364); Davenport (66,039); Cedar Rapids (62,120); Waterloo (51,743); Dubuque (43,892); and Council Bluffs (41,439).

**History.**—Principal state officers in 1945 were: governor,

Robert D. Blue; lieutenant governor, Kenneth A. Evans; secretary of state, Wayne M. Ropes; auditor, Chet B. Akers; treasurer, J. M. Grimes; secretary of agriculture, Harry D. Linn; attorney general, John M. Rankin; and superintendent of public instruction, Jessie M. Parker. All these elected state officers, the U.S. senators (George A. Wilson and Bourke B. Hickenlooper) and the eight Representatives from Iowa, were Republicans. The 51st general assembly, consisting of 50 senators and 108 representatives, met in regular session from Jan. 8 to April 12. One of the principal laws enacted was a compulsory retirement and annuity plan for all state and local government employees. Inadequate support and political control of state penal and charitable institutions finally culminated in such deterioration of administration that an inmate of the Training School for Boys at Eldora died from the infliction of corporal punishment and a series of concerted escapes followed. A general investigation of conditions was begun.

**Education.**—During the school year of 1944-45, out of the school population (ages 5-21) of 631,403, there were 343,464 pupils enrolled in the 9,499 public elementary schools; 116,277 in the 802 public high schools; and 472 in the 15 public junior colleges. This was about 4% less than in 1942-43 which corresponded with the rate of population decrease. Enrollment in the 27 other colleges and universities, 3 of them state-supported, totalled 18,205 in Oct. 1945. Teachers employed in the public schools (not including colleges) numbered 22,951. In the general revision of school laws in 1945, the adoption of state aid was one of the most significant changes. Annually \$1,000,000 was appropriated to supplement local funds in districts where the maximum tax levy is insufficient to produce the prescribed minimum support, and \$2,000,000 annually was appropriated to provide transportation of pupils.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—During the fiscal year ending June 30, 1945, Iowa paid out \$19,128,360 for old-age assistance; \$1,078,007 for aid to dependent children; \$540,829 for aid to the blind; \$108,966 for child welfare; and \$1,413,925 for emergency relief. Of these amounts the federal government contributed \$9,281,235 for old-age assistance, \$542,691 for aid to dependent children; \$266,266 for aid to the blind; and \$22,340 for child welfare. The sum of \$12,968,862 was collected for unemployment insurance and \$265,925 expended, leaving a balance on July 1 of \$59,117,040.

On Nov. 1 there were 13,485 inmates in the 15 state charitable and correctional institutions, the principal groups among them being: 6,685 in the 4 hospitals for the insane; 1,821 in the school for the feeble-minded; 1,672 in the hospital for epileptics; and 1,635 in the 3 state prisons.

**Communications.**—There were in 1945 approximately 100,000 mi. of roads in Iowa, of which more than 9,600 mi. were primary and about 13,750 mi. were county trunk highways. The remainder were local roads. Practically all the primary roads were paved, and more than 90% of the county trunk roads and about 45% of the local roads were hard-surfaced. Highway construction almost ceased during World War II.

Railroads in Iowa operated 13,692 mi. of track including sidings in 1944. They carried 15,302,597 passengers, while 20,229,078 passengers rode in motor buses. The number of motor vehicles licensed in 1945 was 800,430, of which 590,579 were automobiles.

**Banking and Finance.**—On June 30, 1945, there were 97 national banks in Iowa with deposits of \$667,074,000 and resources of \$701,904,000. The 545 state banks had deposits of \$1,196,343,013 (which was an increase of \$157,682,690 over 1944) and assets of \$1,265,504,428. From 13 special taxes and profits from the state liquor business the government of Iowa obtained an income of \$80,176,461, the highest in the history of the state.

The principal sources of revenue were the retail sales tax \$25,140,370; gasoline tax \$19,622,624; motor vehicle tax \$11,807,754; income tax \$8,291,538; cigarette tax \$2,670,868; inheritance tax \$2,034,015; insurance tax \$1,944,957; and profits from the sale of liquor \$5,000,000. Budgeted expenditures for the biennium 1945-47 were fixed at \$53,830,000 annually (an increase of 1.5% over the previous two years), the largest items of which were \$18,420,000 for schools; \$11,300,000 for highways; and \$10,454,000 for hospitals. The treasury had a balance of about \$2,000,000 at the end of June 1945.

**Agriculture.**—There were 209,863 farms in Iowa in 1945 with 34,435,047 ac., averaging 164.1 ac. per farm. The assessed value of farm land and buildings in 1945 was \$1,679,844,771 which was supposed to be about 60% of actual value, and more than \$2,000,000 less than in 1944 due mainly to deterioration of buildings. For the first nine months of 1945 Iowa farmers received a cash income of \$1,083,887,000 which was \$110,279,000 less than for the same period of 1944. Of the total cash income for 1944, \$1,229,898,000 came from livestock; \$213,765,000 from crops; and \$35,518,000 from government payments. On Jan. 1, 1945,

Table 1.—Leading Agricultural Products of Iowa, 1945 and 1944

Crop	1945 (est.)	1944
Corn, bu. . . . .	508,106,000	607,608,000
Oats, bu. . . . .	214,440,000	144,270,000
Soybeans (grain), bu. . . . .	34,848,000	42,580,000
Hay (tame), tons . . . . .	5,644,000	5,528,000
Potatoes, bu. . . . .	3,960,000	2,470,000
Wheat, bu. . . . .	2,745,000	2,248,000
Popcorn, bu. . . . .	1,500,000	1,221,570
Rye, bu. . . . .	174,000	150,000
Barley, bu. . . . .	84,000	259,000

Table II.—Principal Mineral Products of Iowa, 1944 and 1943

Mineral	1944		1943	
	Production	Value	Production	Value
Bituminous coal . . .	2,140,963 tons	\$7,493,370	2,770,610 tons	\$8,575,522
Cement . . . . .	3,408,616 bbls.	5,677,787	3,912,307 bbls.	6,335,173
Stone . . . . .	3,563,020 tons	4,175,005	3,544,560 tons	4,327,782
Sand and gravel . . .	5,271,031 tons	2,084,149	5,070,927 tons	1,979,559
Gypsum . . . . .	398,143 tons	655,392	418,092 tons	595,602

there were 10,990,000 hogs on Iowa farms; 5,528,000 cattle; 1,723,000 sheep; 581,000 horses; and 31,000 mules, all less than in 1944.

**Manufacturing.**—Although meat packing and cereal processing continued as major Iowa industries in 1945, most of the factories were converted to war production. In addition to the huge munitions plants at Burlington and Des Moines, 63 companies turned out ordnance valued at \$225,229,842 during the war. Many factories supplied articles for military use.

**Mineral Production.**—Iowa ranked 28th among the states in the total value of minerals produced in the U.S. from 1911 to 1943.

(J. E. B.)

**Iowa, State University of.** Located at Iowa City, Ia., this institution of higher education was established Feb. 25, 1847, and was the first state university to admit women on equal standing with men. With the number of veterans exceeding 700, enrolment increased about 815 or nearly 25% in the fall of 1945, reaching 4,608. A new record for number of women students, 2,878, was established. The U.S. navy pre-flight school, in operation from April 1942, closed in December, after having trained some 17,000 cadets. Alumni and former students in the armed forces passed the 9,700 mark. President Virgil Hancher in September announced a \$10,000,000 building program, with a library and communications centre among the first units to be started in 1946.

(For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

**Iowa State College.** This land-grant college, located at Ames, Ia., founded in 1858, contributed notably to the war program through the discovery by its scientists of the process of producing metallic uranium used in the atom bomb. Co-operating with the armed forces educational program, Iowa State college at one time had 3,400 students in uniform. A permanent N.R.O.T.C. program was installed in November 1945; an R.O.T.C. unit had been in operation for many years. Bachelor of science degrees are awarded in about 50 different fields of instruction in the five divisions, agriculture, engineering, home economics, science and veterinary medicine. In the graduate college the degrees conferred are master of science and doctor of philosophy.

In 1945 the college was on the approved list of schools co-operating in the educational program established by the passage of the Veterans' Readjustment act. It was soon to launch a \$2,297,500 building program.

(For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

**Iran.** Known before March 1935 as Persia, a country of western Asia bounded to the east by India and Afghanistan, on the north by the U.S.S.R., on the west by Iraq and Turkey, and on the southwest and south by the Persian gulf and Arabian sea; ruled after 1926 as a constitutional kingdom. Ruler: Shah Mohammed Riza Pahlavi; premier: Ebrahim Hakimi (1945). Area, c. 628,000 sq.mi.; pop. (est.), 15,000,000. Chief towns (pop. 1940 census): Tehran (cap., 540,087), Tabriz (213,542), Isfahan (204,598), Meshed (176,471), Shiraz (129,000). Language, Persian; religion, Mohammedan.

**History.**—In May 1945, after the end of the war in Europe,

OIL PIPE LINE in Iran connecting a new field developed in 1945 at Agha Jari with the refinery at Abadan. All are owned by the Anglo-Iranian Oil Co.

the government of Iran asked the British, Russian and U.S. governments to withdraw their troops from the country. In fact the treaty concluded by Iran with Great Britain and the U.S.S.R. in Jan. 1942 was generally interpreted as providing for withdrawal of foreign troops from Iran within six months after the end of the war with Japan; and in September the Iranian government again sent notes to the three powers, this time declaring that March 2, 1946, was the final date for evacuation. The matter was discussed at the Berlin conference, where it was agreed that soviet and British troops should be withdrawn from Tehran, and again at the council of foreign ministers in London. On the latter occasion, in September, notes were exchanged between the British and soviet foreign ministers, the former specifying March 2, 1946, as the date for the completion of the withdrawal, and the latter confirming that the withdrawal should be effected within the period laid down in the Anglo-Soviet-Iranian treaty.

Simultaneously with the Iranian notes of September, a protest was made to the soviet embassy on the ground that a unit of the Iranian gendarmerie had been stopped by soviet troops on its way to take action against mutinous officers of the Iranian army in the northern part of the country. The control of the Iranian government over the northern provinces was certainly defective, and in Azerbaijan a democratic party was organizing a movement for autonomy which led to a rising in November. Troops sent north by the central government were stopped by the Russians in front of Kazvin, on the ground that their entry into Azerbaijan would have provoked more serious disorders and would thus have necessitated the dispatch of additional Russian troops to restore the situation. Thus protected, the autonomists formed a committee to administer the province, and held provisional elections. At the same time there was unrest among the Kurds in the northwest. After the incident at Kazvin, representations were made in Moscow by both the U.S. state department and the British foreign office.

The government of Nurteza Qualikhan Bayatt resigned in April on failing to obtain a vote of confidence in the Majlis. Its successor, formed by Ebrahim Hakimi, failed for the same reason after an existence of only three weeks. On June 7 a new administration was formed by Mushin Sadr, but in October Hakimi was again elected to succeed Sadr and form a new government.

Figures of Iranian oil production were again published, showing an increase from 8,300,000 tons in 1939 to 11,500,000 in 1944. It was also announced that the supplies sent to Russia by the trans-Iranian route had reached a total of more than 5,000,000 tons by the spring of 1945, when other and easier routes supplanted it. The operation of the railway between Tehran and the Persian gulf reverted in June to the Iranian government, who purchased U.S. installations and running stock.

Dr. Arthur C. Millspaugh, the U.S. financial adviser, resigned in June.

**Education.**—(1938) 8,381 schools; 457,236 scholars; 13,078 teachers; one university at Tehran.

**Banking and Finance.**—Revenue, ordinary (1944-45) \$137,900,000; expenditure, ordinary (1944-45) \$137,900,000; foreign loan (nil); public debt (1944) \$76,925,000; note circulation (March 1945) \$230,775,000; gold reserve (March 31, 1944) \$32,062,300; exchange rate (1944) 1 rial=3.077 cents U.S.

**Trade and Communication.**—Foreign trade (merchandise) 1943-44: imports \$69,140,200; exports \$135,818,800. Communications 1938: roads fit for wheeled traffic, c. 8,700 mi.; railways open to traffic, 1,072 mi.

**Agriculture and Minerals.**—Production (in short tons): petroleum, crude (1943) 11,330,000; wheat (1941) 1,870,000; barley 1,210,000; rice (est. 1937-38) 420,300; cotton (1943)

22,000; wool (1943) 13,200; beet sugar (1941-42) 26,400; tobacco (1940-41) 13,970.

**Iraq.** An Arab state of the near east, between Iran, Syria and Arabia, watered by the Tigris and Euphrates; an independent kingdom after 1932, when the British mandate was terminated. Area, 116,000 sq.mi.; pop. (census Oct. 1934) 3,561,000 (est. 1944) 4,500,000. Chief towns: Baghdad (cap. 400,000), Mosul (260,000), Basra (180,000). Ruler: King Feisal II; regent: Crown Prince Abdul-Ilah; premier (1945): Hamdi al-Pachachi; language: Arabic; religion: mainly Mohammedan, but also Christian, Jewish, and other communities.

**History.**—Together with six other Arab states, Iraq became an original member of the Arab league on its formation in March 1945. The regent, Prince Abdul-Ilah, visited the United States in May for an official visit at the invitation of President Truman. He returned home by way of Great Britain and Turkey, paying a state visit to the latter country.

In June the Iraqi and British governments reached agreement on the supply of dollars and other "hard currencies" for Iraq's foreign trade. Under this agreement Iraq was to be supplied with such currencies at a rate of £6,000,000 per annum.

The government of Iraq was preoccupied during the autumn by a revolt of the Barzan tribe of Kurds under the leadership of Mullah Mustafa.

**Education.**—In 1938: elementary schools, government, 741; scholars 94,368; new schools opened 1938-39, 22; secondary schools 14; scholars 1,904; intermediate schools 48; scholars 10,611.

**Finance.**—Revenue, ordinary (est. 1943-44) \$37,350,000; expenditure, ordinary (est. 1943-44) \$49,600,000; notes in circulation (Sept. 1944) \$158,200,000; foreign assets reserves (March 1944) \$160,300,000; exchange rate 1944 (currency based on sterling): 1 dinar=£1 sterling=approx. 403.5 cents U.S.

**Trade and Communication.**—Foreign trade 1943 (merchandise): imports \$63,073,579; domestic exports \$19,916,889. Leading imports by value: cotton and cotton cloth \$13,981,166, coffee, tea and spices \$9,036,890, clothing \$4,839,324, sugars and confectionery \$4,068,857. Leading exports by value: dates \$7,757,154, cereals \$4,758,265, wool and wool cloth \$1,973,050, cotton and cotton cloth \$1,653,946, hides and leather \$1,458,773. Communications: roads open to traffic (1940) c. 4,000 mi.; railways, open to traffic (June 1940) 947 mi.

**Agriculture and Minerals.**—Production 1938-39 (in short tons): petroleum, crude (1940) 3,781,000; wheat, 860,000; rice, 393,000; barley, 1,251,400; tobacco, 4,400; wool (1938) 9,100; cotton (1940-41) 3,960; cotton seed (1940-41) 9,350.

**Ireland:** see EIRE.

## Ireland, Northern.

Northern Ireland comprises the six counties of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone, forms part of the United Kingdom of Great Britain and Northern Ireland, but (after 1920) has its own parliament and executive, with limited powers for local purposes, though also represented in the imperial parliament by 13 members. Area, 5,238 sq.mi.; pop. (June 1939) 1,295,000. Chief cities (pop. census 1937): Belfast (cap. 438,086), Londonderry (47,813). Language: English; religion: Christian (Roman Catholic 33.75%; Presbyterian 31.4%; Episcopalian 27%). Ruler and national flag, as for Great Britain. Governor in 1945: the earl of Granville; premier: Sir Basil Brooke.

**History.**—King George, Queen Elizabeth and Princess Elizabeth visited Ulster in July 1945. The king, in his message to the

senate and house of commons, thanked the people of Northern Ireland for their contribution to victory, and for welcoming the first contingent of United States troops to British shores, thus strengthening Great Britain's bond of friendship with the United States.

At the general election held in July the Unionists won a majority of 14 seats. Sir Basil Brooke, the premier, and his cabinet were returned. Commenting on Eamon de Valera's statement that Eire was a republic, Sir Basil Brooke said in the house of commons on July 24 that Northern Ireland was British in outlook, socially and economically, and the government would act firmly against those people who might think that violence would attain what constitutional means could not.

There was labour unrest during 1945, notably among aircraft workers in Belfast, who protested against being dismissed from work without being given alternative employment. A new act empowering the government to give financial assistance to new industrial undertakings likely to create employment was expected to help ease the transition from war to peace production.

On Sept. 7 Vice-Admiral Lord Granville was sworn in as governor of Northern Ireland, in succession to the duke of Abercorn. (J. RA.)

**Education.**—In 1944-45: elementary schools 1,667, scholars 185,621; secondary schools 76, scholars 18,854; university students 2,663; technical schools 61, students 24,890.

**Finance.**—Revenue (est. 1944-45) \$219,400,000; expenditure (est. 1944-45) (including \$141,000,000 imperial contribution, and surplus \$145,000), \$219,000,000; exchange rate (1945) £1=403.5 cents U.S.

**Trade and Communication.**—External trade 1943: imports \$408,500,000; exports \$401,000,000. Communications 1943: roads used by motor traffic 13,192 mi.; railways, broad gauge 619.15 mi., narrow gauge 52.76 mi.; canals, 88½ mi.; shipbuilding, tonnage (merchant ships more than 100 tons) launched (1943), 119,439; value of linen goods exported 1943, \$14,800,000.

**Agriculture.**—Total area under crops and grass June 1, 1945, 2,264,787 ac., including 447,848 ac. oats, 531,606 ac. rotation grass, 947,456 ac. permanent grass, 189,733 ac. potatoes, 80,295 ac. flax. Cattle 919,280; sheep 654,311; pigs 249,004; poultry 17,471,353. In 1944-45 cattle and sheep to the value of \$12,020,000; eggs \$14,090,000; ware potatoes \$3,620,000, seed potatoes \$2,417,000—total \$6,037,000; and fruit to the value of approximately \$5,020,000 were shipped from Northern Ireland to Great Britain. In addition 3,900,000 U.S. gal. of milk were shipped for liquid consumption in Great Britain during the winter months.

**Irish Free State:** see EIRE.

**Iron and Steel.** For convenience in coverage, this subject is subdivided under three heads—iron ore, pig iron, and steel. There are still many gaps in the production tables.

**Iron Ore.**—All available data on important iron ore producing countries are included in Table I.

The close of World War II again made possible international trade in iron ore, which had been largely discontinued except where it could not be dispensed with. The first shipment of ore from Chile was received in the United States in Aug. 1945, and the first shipments of Swedish ore were made to Great Britain in July. Algeria showed a marked increase in activity in 1945, and Spanish Morocco had a smaller increase; Tunisia was still largely inactive, and there was a sharp decline in Spain, both in output and exports. However, as conditions became more nearly normal these and other exporting countries would doubtless revert more nearly to their prewar status, and domestic outputs

Total . . . . .	219	234	257	270	?	?

that were inflated by war demands were expected to decline. This reaction was manifest in the United States and Great Britain.

**United States.**—Iron ore production began to decline slowly as soon as the peak of war demand had been passed in 1943. In 1943 there was a 4% decline from 1942, and in 1944, 7%. There was a further decline in 1945, the total for the first ten months being 92,587,191 short tons, 6% under the same period of 1944, while shipments in the same periods dropped 8%.

**Pig Iron.**—World production of pig iron, so far as data were available, is shown in Table II. In most instances the figures given include ferroalloys.

**United States.**—There was only a minor increase in pig iron output in 1944, followed by a decline in 1945. During the first ten months of 1945 output totalled 45,185,310 short tons, not including ferroalloys. This rate was still above the level expected for the postwar demand, and further decline was to be expected.

**Great Britain.**—During the first ten months of 1945, pig iron

Total . . . . .	113	108	?	?	?	?

production was at an annual rate of 8,510,000 short tons, and was increasing.

**Canada.**—In the first ten months of 1945 pig iron production was 1,508,082 short tons, and ferroalloys 158,162 tons, a total

STEEL PRODUCTION in the United States, 1928-45; monthly average percentage of capacity (figures compiled by American Iron and Steel Institute)

of 1,666,244 tons, against 1,721,504 tons in the same period of 1944. Pig iron declined but ferroalloys increased slightly.

**Steel.**—World data on steel were much less complete than on pig iron, and many of the figures given in Table III are estimates, the reliability of which is uncertain.

**United States.**—Steel production made a slightly larger increase in 1944 than did pig iron, and then declined rather sharply in 1945. Production during the first 11 months of the year was 73,706,031 short tons, as compared with 82,275,405 tons in the same period of 1944. Beginning in March, the average weekly output dropped from 1,739,947 tons to 1,263,608 tons in October, but recovered somewhat in November. The year's total was expected to be close to 80,000,000 tons.

**Great Britain.**—Production through Oct. 1945 was at an annual rate of 14,157,000 short tons.

**Canada.**—Steel production through Oct. 1945 totalled 2,454,061 short tons, against 2,517,005 tons in the same period of 1944.

**Brazil.**—The largest steel plant in Latin America, the integrated plant at Volta Redonda, was nearing completion. Coke ovens, blast furnace, open hearth steel furnaces, boiler house, power house and blooming mill were finished at the end of 1945. A rail and structural mill and a sheet and tin mill were expected to be completed in the first half of 1946. (See also BUSINESS REVIEW; METALLURGY.) (G. A. Ro.)

**Iron and Steel Institute, American:** see SOCIETIES AND ASSOCIATIONS.

**Irrigation.** **United States.**—The run-off forecast of the U.S. department of agriculture issued in the spring of 1945, based on snow surveys of the department and co-operating agencies, predicted an adequate irrigation water supply for the 1945 irrigation season for the majority of western states. The report of the U.S. geological survey for the water year 1945 substantiated the pre-irrigation season forecast since the season ended with storage reserves for power, irrigation, industrial and municipal use in favourable condition. The greatest improvements were reported in the west, where run-off averaged 100% of normal during 1945 as compared with 88% during the preceding year. As a result holdover reserves for irrigation greatly improved.

The treaty concluded with Mexico Feb. 3, 1944, and effective Nov. 8, 1945, provided for the equitable distribution between the U.S. and Mexico of waters of the Colorado river and the Rio Grande below Fort Quitman, Texas; studies regarding the conservation and utilization by these two countries of the waters of the Tijuana river system; the construction and operation of certain works required for the conservation of waters of the Rio Grande, for flood control, and for the distribution between the two countries of the waters of the Rio Grande and of the Colorado river; studies relating to feasible hydroelectric plants at the international dams on the Rio Grande as well as for necessary flood control works, in addition to the multiple-purpose

dams specifically enumerated, on that stream and the Colorado river, and for the subsequent construction of such hydroelectric plants and flood control works as would be approved by both governments.

The treaty equitably apportioned the waters of the three international streams (Rio Grande, Colorado river and the Tijuana river). It made provision for the construction or utilization of such works as would be necessary to make the division effective and permit of the most efficient and economical use of the waters. It vested in an already existing and experienced international agency, the joint International Boundary and Water commission, general supervision over the carrying out of treaty provisions, subject at all times to the control of the two governments. The U.S. section of the commission was to act as the U.S. representative in the discharge of functions imposed upon the U.S., and in the protection of U.S. rights under the treaty, subject to the control of the U.S. government and, where expenditures of funds were involved, to congressional appropriations. In effect, the U.S. section was to act as a clearing-house through which matters involving treaty rights, obligations and functions would be cleared, without in any way encroaching upon the jurisdiction of any interior agency, federal, state or local.

In the Imperial valley, marketing of agricultural products continued on a very satisfactory basis during 1945, which was reflected by a continued era of prosperity in this agricultural community. Canal and drainage maintenance continued on a restricted basis because of the labour shortage and the difficulty in maintaining equipment in good operating condition. The increased use of irrigation water continued to tax the facilities very heavily and required enlargement of both canals and structures in certain locations.

The All-American canal was still operated by the U.S. bureau of reclamation in the upper portion. Some serious difficulty was encountered during the first three months of 1945 in the operation of the desilting works at Imperial dam. Excessive scouring developed in the lined effluent channels which required several complete cutouts of water during this period, one of which deprived a portion of the valley of water for about eight days. Crop damage was not unduly heavy because of the time of year at which this occurred.

Operation of the electric power system of the district continued throughout the year without any undue difficulties, but expansion of the system was hampered greatly by the shortage of materials and labour. Independent studies and reports were made during 1945 in which the need was developed for additional generating capacity. These reports led to the calling of a special election in December, at which time the voters of the district approved the issuance of power revenue bonds in the amount of \$6,200,000 for the financing of additional generating and transmission facilities as outlined in these reports. The principal items included were a 20,000-kw. steam electric generating station to be located in El Centro and the installation of additional turbogenerators at both the Drop 3 and Drop 4 plants.

U.S. bureau of reclamation irrigation facilities in 1945 served more than 4,000,000 ac. of land in the arid and semi-arid regions of the west, where agricultural economy is dependent on adequate supplies of irrigation water.

In addition to agricultural products, reclamation development provided great blocks of hydroelectric energy from falling water at great dams, such as Boulder, Grand Coulee and Shasta. Thirty-one hydroelectric plants on bureau projects had a record output in the fiscal year 1945 of almost 14,000,000,000 kw.hr. Electric energy was generated at bureau projects to provide power for irrigation pumping and other purposes. Surplus power was sold

for municipal use, rural electrification and other industrial needs, the revenue from such sales being used to repay part of the costs of irrigation development. New hydroelectric systems and additional installations in power plants on reclamation projects were expected to bring the total capacity from 2,439,300 kw. in 1945 to a proposed 9,324,000 kw.

In April 1945, the bureau presented to the congress an inventory of 415 projects proposed for construction in the postwar period. This inventory included projects under construction and those on which preliminary studies had been completed.

Approximately 200,000 new irrigated farms would be made available for settlement by veterans and others, by construction of all the projects listed. The proposed work called for the irrigation of nearly 11,000,000 ac. of new lands, and supplementary irrigation for approximately 11,000,000 ac., where water shortages had hampered crop production.

With the relaxation on wartime restrictions of manpower and materials and the appropriation of sufficient funds, the bureau was expected to be able to advance construction which would offer employment and settlement opportunity to thousands of persons.

During 1945, however, all work was focused on the dual purpose of war-food and war-power production. Outstanding irrigation structures completed during the year included the 37-mi. Madera canal in the central valley project. Construction was also started on the 160-mi. Friant-Kern canal and other important features of California's great multiple-purpose development.

In New Mexico, the first section of the Conchas canal was completed on the 45,000-ac. Tucumcari project. Construction passed the halfway mark on Anderson Ranch dam, Boise project, Ida. This was to be the highest earth-fill dam in the world. It would provide flood control and store irrigation water for 290,000 ac. which were inadequately watered.

An earth dam was under construction on the Deschutes project, Ore., to provide irrigation for approximately 20,000 ac. On the Yakima Roza project, Wash., construction was continued on canals and a distribution system for irrigating 32,000 ac.

Work progressed on the Gila project in Arizona and on the Coachella canal in southern California. Other construction included the initiation of lining operations on the 13-mi. Alva B. Adams tunnel under the Continental Divide. Limited work was carried forward on the Green mountain and Shadow mountain dams of the Colorado-Big Thompson project. This project was designed to serve 615,000 ac. in northeastern Colorado.

Fifty miles of canals were constructed, and work was continued on other water distribution facilities.

A survey of construction by the bureau of reclamation from June 30, 1902, to June 30, 1945, revealed that the bureau of reclamation had built 15,495 mi. of irrigation canals. Storage reservoirs behind its dams had a capacity of 66,558,840 ac.ft., and its storage and diversion dams, combined, contained a total of 83,743,155 cu.yd. of materials.

The 347 tunnels constructed by the bureau had a combined length of 560,271 ft. Thirty-one hydroelectric plants operating on its projects had an installed capacity of 2,439,300 kw. Part of the energy was marketed over 2,164 mi. of transmission lines built by the bureau.

Bureau of reclamation irrigation works built over the 43-yr. period also included 209,016 canal structures; 5,196 mi. of waste water ditches and drains; 13,676 bridges with a combined length of 362,002 ft.; 23,620 culverts totalling 1,101,146 ft.; 6,318 flumes with a combined length of 873,989 ft.; 331 pumping plants having a discharge capacity of 7,422 cu.ft. per second; and protective levees containing 12,758,365 cu.yd. of materials.

SECTION OF PIPE LINE of the Salt Lake aqueduct, under construction in 1945. It is part of the U.S. bureau of reclamation's Provo river project in Utah, to irrigate lands along the eastern Salt Lake valley and supply water to Salt Lake City

Schedules on incompleted projects and on proposed projects were being adjusted to meet employment demands. Completion of all proposed developments, however, would not mean the end of employment opportunities. It would open more and more jobs on farms, in businesses in project towns and in factories of the other sections of the country, which would be kept busy supplying new western markets.

**Bolivia.**—With the Angostura dam in the department of Cochabamba, designed to supply water for the irrigation of 22,000 ac., Bolivia was planning to enlarge its program of irrigation development. Other projects under consideration in 1945 planned for the construction of the Rio Viscachani dam in the department of La Paz, to irrigate 6,200 ac.; Rio Tacaqua dam in the province of Collapata, department of Oruro to irrigate 12,000 ac.; Rio Desaguadero dam in the department of Oruro, to irrigate 15,000 ac.; and the Rio Pilcomayo dam in the department of Tariji to irrigate 100,000 ac.

Hydroelectric energy would also be developed in connection with the irrigation program.

**China.**—The Szechwan provincial government was reported to have undertaken plans for the biggest irrigation project in northwestern Szechwan to water the whole agricultural region drained by the Ya river.

Under the name of the Chengyi irrigation system the project was planned to have aggregate facilities for the irrigation of several million acres and would benefit around 1,800,000 inhabitants in the river basin. It was estimated that the irrigated area would increase the yield of rice annually by 250,000,000 piculs. Construction was scheduled to start in Sept. 1945. The Ya river and the Min Kiang drain a triangular region covering 8 large districts, 3 of which were irrigated with water from the Min Kiang while the remaining 5 were without the benefit of irrigation. The project was planned to supply water for these arid areas.

**India.**—In India, irrigation had been practised for centuries, but it was mainly during the last 100 years that extensive state-controlled works were constructed and benefits of irrigation extended to vast areas. The water supplies for irrigation were obtained, in the great plains of northern India and Madras, by diversion barrages on perennial rivers; the largest single barrage was that on the Indus, at Sukkur in Sind, which diverted 46,000 cu.ft. of water per second to irrigate, on full development, 5,000,000 ac. of crops annually. In the hills of central and southern India, water

was stored in reservoirs during rains and was gradually let into canals in the dry season. Throughout India, irrigation from wells was practiced on a large scale. In the United Provinces a system of state-managed tube wells was introduced in the Ganges canal area, worked by power generated at falls in the main canal.

The total area irrigated was 70,000,000 ac. annually, by far the largest acreage of any country in the world, of which 65% was from government-managed works and 35% by private enterprise.

A major project under construction in 1945 in the Punjab, which already had the most extensive irrigation works in the country, was the Thal project which included a barrage 4,890 ft. between abutments, with a maximum discharging capacity of over 900,000 cusecs. The total cost of the scheme including the cost of headworks, main canal, branches and distributaries was expected to amount to Rs. 7,75,00,000 (about \$25,000,000) (1 Rs.=30.122 U.S. cents, Nov. 1945). The annual area which the project was expected to irrigate was over 800,000 ac. The main canal and branches were being lined with concrete. Work was also started on the Tungabhadra project in Madras. The reservoir was to have a water spread of 138 sq.mi. and effective capacity of more than 2,600,000 ac.ft. The dam would be a masonry gravity type with a central length of about 1,800 ft. and an ogee type spillway to pass the maximum flood discharge of 650,000 cusecs. The spillway would have 26 gates 60'x20'.

The Emergency Irrigation schemes undertaken in pursuance of the "Grow more food" campaign, during World War II, included the employment of indigenous methods of irrigation—irrigation by mechanical means such as tube wells, river pumping, etc. and was expected to irrigate nearly 4,000,000 ac. of food crops. The additional yield of food grains to be obtained would be over 800,000 tons.

Mexico.—The Suchiate project in the state of Chiapas started work to utilize the flow of the Suchiate river which forms part of the boundary between Mexico and Guatemala. This was to provide for the irrigation of 10,000 hectares.

The Delicias Irrigation district in the state of Chihuahua continued construction of Las Virgenes dam on the San Pedro river, a tributary to the Conchos river. The Conchos is in turn a tributary to the Rio Grande which forms the boundary between Mexico and the United States. The district in 1945 irrigated 20,000 hectares and the completion of this dam was expected to increase the irrigated area to 60,000 hectares.

The Laguna Irrigation district in the state of Durango had under construction El Palmito dam on the Nazas river which was nearing completion. This is an earth- and rock-filled dam 92 m. high, and would create a reservoir capable of supplying enough water to irrigate 110,000 hectares.

In the state of Jalisco the Bajo Lerma Irrigation district was continuing work on the Lower Lerma in order to provide irrigation and drainage for 50,000 hectares reclaimed from the Chapala marsh. In addition 16,000 hectares in Ocotalan would be irrigated by pumping.

In the state of Oaxaca, construction was continued during 1945 on the Main Grand canal which took water from the Tehuantepec river to irrigate 20,000 hectares. With the completion of a great storage dam the irrigated area would be increased to 100,000 hectares.

The Valsequillo Irrigation district in the state of Puebla rushed construction of an earth-rock-fill storage dam 80 m. high. The accessory works included a 12-km. tunnel, the main and lateral canals with appurtenant structures and roads and drainage works. The project was designed to irrigate 45,000 hectares and was expected to cost more than 100,000,000 pesos (1 peso=20.578 U.S. cents, Nov. 1945).

The Sanalona project in the state of Sinaloa continued construction on an earth- and rock-fill dam on the Culiacán river during the year. This dam would create a reservoir of sufficient capacity to irrigate 110,000 hectares of very fertile land.

Construction was also continued on canals on both sides of the Yaqui river in the state of Sonora intended to increase the irrigated area from 60,000 to 120,000 hectares. This construction was being done because of the completion of La Angostura dam on one of the tributaries of the Yaqui river.

In the state of Tamaulipas work on canals and drainage systems for the Irrigation district of the Lower Rio Grande across from Brownsville, Tex., was continued. Due to the International Water Treaty ratified between Mexico and the United States, this irrigation district would have a total area of 250,000 hectares.

In Lower California (Mexico), canal work to increase the irrigated area of the Colorado river project was continued during 1945. This District would have an approximate area of 200,000 hectares with enough water allocated by the International Treaty.

In addition to the projects listed, the National Irrigation commission had under way fully 79 small irrigation projects throughout the republic to provide irrigation for units of from 2,000 to 30,000 hectares each.

Uruguay.—The Public Works program of Uruguay had under construction a program of intensive construction of irrigation works. The plans included electrification of various provinces as well as the economic transformation of the provinces through increased cultivation as a result of irrigation.

In the region of Arapey, a rich river zone of the republic, a major canal was to be built which would serve for navigation purposes, utilizing the upper reaches of the Uruguay river. This canal would also supply the water necessary for the irrigation of about 49,000 ac., and in addition serve to develop 10,000 kw. of electric energy for the two provinces of Salto and Artigas. The project was considered an important factor in the agricultural development of the region where the climate was adaptable to the production of sugar cane, flax, jute, garden crops and fruit. **Islam.** The Pan-Arab conference at Alexandria in Sept. 1944 had laid stress on Arab unity and closer co-operation between Arab states, and in 1945 the modern movements in the direction of Islamic unity were illustrated by significant happenings in various Islamic countries. Syria and Lebanon earnestly discussed questions of joint policy. Arabic radio broadcasts covered larger and larger ground and the circulation of the Arabic *Listener* rose rapidly. King Ibn-Sa'ud established a radio station in his capital, which brought him into direct connection with the world at large. In Turkey the halkevleri or people's houses, instituted by Kemal Atatürk for educational and propaganda purposes, had great influence on modern Turkish life and thought. In India the twofold influence of the Aligarh university and the Moslem league gave fresh direction to the educational and political thought of Indian Moslems. In London the Arab diplomatic mission headed by Abdul Rahman Azam Bey had in 1945 considerable success in bringing together representatives of various Islamic countries in friendly social contact. **Italian Colonial Empire.** The accompanying table gives essential information relating to the so-called Italian colonial empire.

The German garrisons in the Dodecanese surrendered to Greek troops, led by British and Greek officers, on May 8, 1945. The question of the future of these islands, together with the rest of the Italian colonial empire, was among the problems discussed at the council of foreign ministers held in London from Sept. 10 to Oct. 2.

Both the United States and Russian delegations made definite proposals. The U.S. plan was that all or most of the Italian colonies should be put under trusteeship, as was suggested in the United Nations charter. Independence would be granted to all the colonies in Africa except Italian Somaliland within 10 or 15 years. Each colony would be administered by a governor-general appointed by the trusteeship council of the United Nations organization. He would be aided by an advisory council of seven members, including representatives of the United States, Britain, France, Russia and Italy and separate representatives of the Arab and non-Arab inhabitants of the colonies. Britain and China were said to support this plan. France was said to be opposed to the time limit for granting independence because of its possible effect on the French colonies, but willing to accept the U.S. proposal as a basis for discussion.

The soviet government favoured individual trusteeship rather than the collective trusteeship envisaged in the U.S. plan, and suggested that the U.S.S.R. was well qualified by reason of its experience in developing the backward people of central Asia to hold the trusteeship of Tripolitania. Vyacheslav Molotov, soviet foreign minister, made it clear that his government was concerned about Eritrea, but did not put forward a request for the trusteeship of this area comparable with his request for the Tripolitania trusteeship.

Egypt, in a note sent to the council, asked for a plebiscite to be taken to ascertain the views of the Libyan people and referred to Egypt's rights in Eritrea. The chiefs of all the tribes in Cyrenaica and Tripolitania also drafted a note to the British and United States governments asking for complete independence, an independent administration for the two territories, and representation at the peace conference. The secretary of state for India stated in a letter to the president of the council that "the sympathy felt inevitably in India and throughout the

†Libyan population census 1936, Italians excepted, the latter (approx. 150,000) being included in Italy.

Moslem world for the people of Islamic faith now freed from the Italian yoke in N. Africa, Eritrea and Somaliland, cannot but create close interest on her part in the future welfare of these peoples." He stressed the strategic importance of these territories in linking India with the west.

That Italy should lose the Dodecanese was accepted by everyone, including the Italian government. The Turkish government intimated in August that it would raise no objection to the Dodecanese passing to Greece and the British foreign secretary assured the Greek regent on Sept. 11 that he would watch Greek interests and see that they were looked after.

Italian opinion as reflected in the press seemed to be that Libya would become a trusteeship of the United Nations in which Italy itself would eventually participate and North Africa would thus continue to be an outlet for Italian emigration. There was less optimism about the future of Eritrea, however.

The multiplicity of interest in this area of immense strategic importance presented problems too complex to be solved at the plenary session of the council of foreign ministers. The question of the future of the Italian colonial empire was therefore referred to the deputies for detailed study. Meanwhile the territories continued to be administered by British military government.

Anti-Jewish rioting by Arabs occurred in Tripolitania on Nov. 4 and 5 and there were heavy casualties among Jews and Arabs. Local Arab and Jewish leaders dissociated themselves from the law-breakers.

The attitude of the Italian government on the future of the empire was revealed in official correspondence between the Italian and United States governments published in Washington on Nov. 7. The Italian foreign minister stated that Italy was ready to see Italian Somaliland placed under a system of trusteeship, but that in Eritrea the maintenance of Italian sovereignty was essential. He also stated that Italy gathered that while no objections were raised to Italian sovereignty in Tripolitania, strategic guarantees were being sought in Cyrenaica. ## Italian Literature.

During 1945 Italy's most flourishing industry, besides the black market, was the publishing business. New dailies and periodicals sprang up like mushrooms. Publishers, despite the paper shortage, put out a considerable number of new books. New writers found immediate outlet in magazines edited by outstanding literary and political figures. Students of Italian affairs wishing to formulate an opinion on the trends of Italian thought must turn

to party and politico-literary reviews. Here the old and the new generation freely discussed: pure versus "social" art, existentialism and idealism, realism and surrealism, the socialist and the communist state, the United States of Europe and world federation. As a reaction to 20 years of enforced intellectual isolationism, ample space was allocated to articles by or on foreign writers.

The experiences undergone by some Italian intellectuals under fascism opened new literary vistas. Typical is the "letteratura castellata," a literary work "day-dreamed" to the last detail in prison where no paper or ink were allowed the political prisoner. Outstanding thus far was *Il diavolo fra i pastori* (Mondadori), a novel by F. Brundu, pseudonym of an intellectual. Other works written in or about confinement were: R. Gualino's *Solitudine* (Darsena), Professor M. Giua's *Ricordi di un ex-detenuato politico* (Chiantore) and C. Levi's *Cristo s'è fermato ad Eboli* (Einaudi). F. Jovine's *L'impero in provincia* (Einaudi) described stultifying provincial life under fascism. Joyce Lussu in *Fronti e frontiere* (Edizioni U) told of her husband's adventurous return from exile to organize the underground forces. Life in prison camps and the return of the prisoners were vividly described by G. Persico in *Quaderno di un detenuto* (Barbera) and S. Terra in *Ritorno di prigioniero* (Edizioni U).

The inside story of political and military events in Rome from Mussolini's fall to the liberation of the city in 1944, was furnished by P. Monelli, a fascist journalist close to government circles, in *Roma 1943* (Migliaresi), while V. Gorresio's *Un anno di libertà* (O.E.T.) covered the liberation of Rome to the end of World War II. Of the many diaries and stories of writers fighting with the partisans or Allied prisoners, those of historical and psychological interest are: A. Benedetti's *Paura all'alba* (Documento), E. Vittorini's *Uomini e no* (Bompiani) and R. Battaglia's *Storia di un uomo e di un partigiano* (Edizioni U). The debasing influence of fascism on the Italians was graphically treated by P. Treves in *Cosa ci ha fatto Mussolini* (Einaudi) and by F. Monicelli in *Vent'anni perduti* (Farò), a powerful indictment of the crimes perpetrated by fascism against the youth of Italy and friendly nations. Of importance, especially to historians, was a series of books which shed new light on fascist domestic and foreign policy: *Posso dire la verità* (Mondadori) by U. Nobile, on his fateful Arctic flight; *Ordini alla stampa* (Polilibraria) by C. Matteini, containing Mussolini's directives to the press; *Il principio della fine* (Farò) by E. Grazzi, former minister to Athens, and *Prologo del conflitto italo-greco* (Treves) by L. Mondini, military attaché to Athens, on the aggression in Greece; *L'armistizio e la difesa di Roma* (De Luigi) by Gen. G. Carboni, and *Come fummo condotti alla catastrofe* (Farò) by F. Giolli.

The existing crisis induced many writers to analyze the his-

tory of the Italian people for a new set of human values: C. Alvaro's *L'Italia rinuncia* (Bompiani), F. Bellonzi's *Ragionamento sulle sventure d'Italia* (O.E.T.), F. Cusin's *L'Italiano: realtà e illusioni* (Atlantica), G. Fenoltea's *Storia Degli Italianeschi* (Barbera), E. Giorgi's *Il dramma del popolo italiano* (Marzocco), G. Pierangeli's *Aspetti della vita italiana dal 1900 al 1945* (Libreria Politica Moderna) and A. De Donno's *L'Italia dal 1870 al 1944* (Critica Politica). Others diagnosed Italian political history in view of a remedy: *Esperienze e soluzioni* (Critica Politica) by O. Zuccarini, *Repubblica e Socialismo* (Edizioni Roma) by G. A. Belloni and G. Renzi, and *I partiti politici nella storia d'Italia* by C. Morandi. A more forward looking group considered the Italian problem as a European and world problem: G. Rulli's *Stati Uniti d'Europa?* (Casella), G. A. Virgilj's *La guerra e la pace* (O.E.T.) and A. Trabalza's *Stati Uniti d'Europa* (Atlantica).

Outstanding in the field of fiction were: *L'acqua* (Darsena), a magic and mythical novel by M. Bontempelli; *I montoni color del Cielo* (Mondadori) by E. Terracini, the tragedy of a man who, having fulfilled his ambitions, finds life empty; *Il vecchio cogli stivali* (L'Acquario) by V. Brancati, lampooning the provincial bourgeoisie, and *La strada che va in città* (Einaudi) by Natalia Ginzburg, a promising new writer.

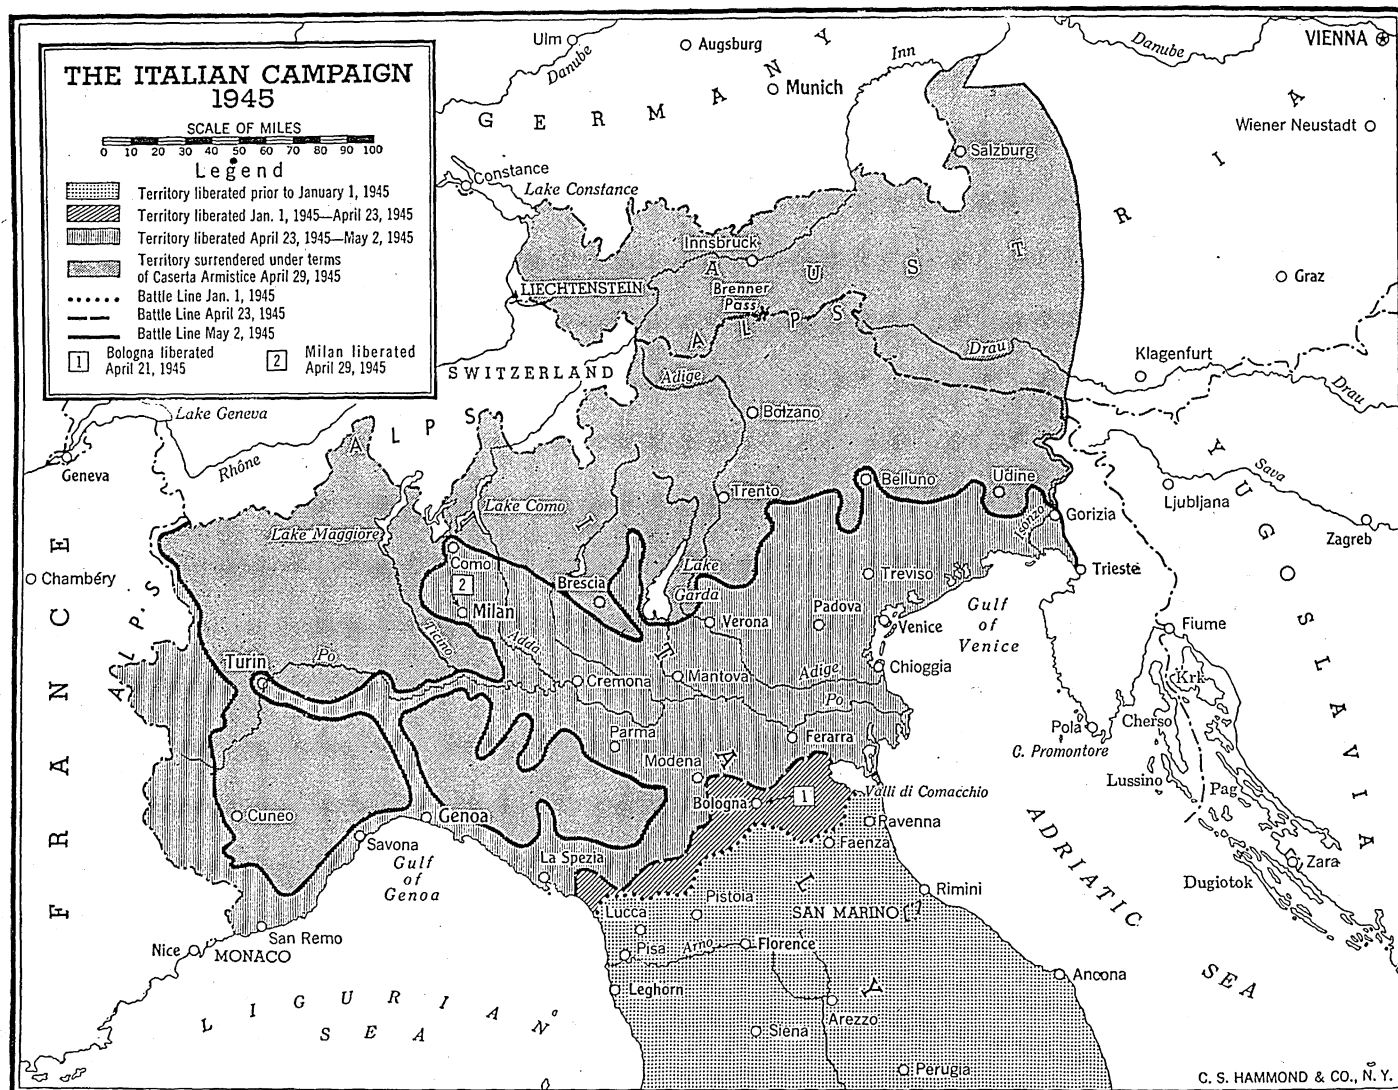

The theatre, though slow in recovering, had to its credit two plays of distinction in 1945: I. Silone's *Ed egli si nascose* (Documento) and L. Trieste's *La frontiera* (Compagnia Landi) both inspired by the existing social and spiritual crisis and both bearing a message of human brotherhood, a theme which figured prominently in the literary productions of the year. (M. F. C.)

**Italian Somaliland:** see ITALIAN COLONIAL EMPIRE.

**Italy.** Legally a constitutional monarchy, in actuality the government of Italy is a provisional regime until the settlement of the "institutional question." Metropolitan Italy consists of the Italian peninsula, Sicily, Sardinia and minor islands of the Tyrrhenian sea, and the Po valley, ringed by the Alps where it borders on France, Switzerland, Austria and Yugoslavia. National flag: the tricolour, green, white and red vertical stripes, with the shield of the House of Savoy in the centre. Capital, Rome.

Area, 119,733 sq.mi.; pop. est. (July 1, 1943), 45,681,000. Chief cities (census 1936): Rome, 1,150,589; Milan, 1,115,848; Naples, 865,913; Turin, 629,115; Genoa, 634,646. Language, Italian. Religion of the state, Roman Catholic. Head of the state, Prince Humbert, lieutenant general of the realm.

**History.**—As the year 1945 opened, Italy was a divided country and a battlefield. North of the German lines, which crossed the peninsula through Tuscany and Emilia, Mussolini's Italian social republic served as a puppet regime for the Germans, useful indeed because it embraced the richest agricultural and industrial part of the country. South of the Allied army zone about half of the provinces of Tuscany, and most of the provinces of the regions of Umbria and Marche were administered by Allied military government (A.M.G.). The rest of the peninsula and the islands of Sardinia and Sicily were under the jurisdiction of the Italian government, but subject to the terms of the Armistice of Sept. 29, 1943, as enforced by the Allied commission (A.C.). The Italian people were heart and soul with

the Allies in the desire to drive the Germans out, but they were seriously divided on almost all other issues. In Sicily there was chronic discontent with the government at Rome and an active movement for separation headed by Andrea Finocchiaro-Parile.

The government, under the lieutenant general, consisted of the council of ministers which by its own decree (June 25, 1944) exercised both the executive and legislative power. Republican opposition had prevented a simple return to the forms prescribed by the *Statuto* of 1848. The permanent form of government, monarchic or republican, and the new constitution were to be determined by a constituent assembly, elected by universal suffrage after World War II. Until convocation of the constituent assembly the ministers were pledged to serve in the supreme interests of the nation and not to commit acts which would prejudice the institutional question. It was an uneasy political truce. Political leaders and editors outside the ministry were free to criticize the lieutenant general and to charge the monarchy with responsibility for its close association with fascism.

Many political parties emerged with the coming of the Allied armies which restored freedom of the press and of association to Italy. Most active were the six anti-fascist parties (reading from left to right): Communist, Socialist, Party of Action, Christian Democrats, Democracy of Labour, Liberals, which were loosely joined in the Roman Committee of National Liberation. The committee claimed to represent the anti-fascist will of the nation and that, lacking an elective assembly, the council of ministers should be responsible to it. The Socialists and Party of Action members had withdrawn from the ministry in Nov. 1944, and Ivanoe Bonomi's second cabinet (announced Dec. 7, 1944) was formed without them. Behind the German lines a separate Committee of National Liberation of North Italy (C.L.N.A.I.) resisted the fascists and, along with the Allies, maintained the partisans in their guerrilla warfare and sabotage against the Germans.

On April 9 General Mark Clark's 15th army group launched the long-awaited final drive and the British 8th army attacked west of Ravenna. After initial stiff opposition the Germans became disorganized and on April 23 the Allies established bridgeheads on the Po. The naval base at La Spezia was captured on April 25. On April 29 Milan, freed by the partisans as were many northern cities, was reached by the liberating Allied armies which were given enthusiastic welcome. Resistance speedily collapsed and more than 160,000 prisoners were taken. On May 1, 8th army troops advancing on Trieste made contact at Monfalcone with Yugoslav partisan forces. On May 2 the German commander capitulated.

The partisans made quick work of the Italian social republic when the German power crumbled. Mussolini, attempting to escape in a column of German trucks, was captured in the disguise of a drunken German soldier near the village of Musso (province of Como) on April 26, and was unceremoniously shot the next day by partisans. Quick action of the partisans disposed of many fascists without the formality of trial, and also saved most of the industrial and hydroelectric plants from destruction by the Germans.

Much had been expected from the "wind from the north" in opposition to the Roman political atmosphere. A.M.G. was extended over the newly liberated provinces and in large measure the nominees of the C.L.N.A.I. were confirmed as city and provincial officials. The committee, however, claimed chief share in the national government. On June 12 Bonomi resigned as president of the council of ministers, and there followed a protracted ministerial crisis, in which the Socialist leader, Pietro Nenni, was deadlocked with Alcide de Gasperi, Christian Democrat. Not until June 21 was Ferruccio Parri ("General Mauri-

ROMANS displaying communist banners demonstrated before the Colosseum on March 6, 1945, protesting the escape of war criminal Gen. Mario Roatta and the conduct of the government in general. A riot ensued at the Quirinale in which demonstrators clashed with armed carabinieri

zio" of the underground) chosen as prime minister with De Gasperi as minister of foreign affairs and Nenni as minister for the constituent assembly. There was renewed popular agitation of the institutional question, and demand for immediate convocation of the constituent assembly. The government, however, had been unable to prepare the voting lists or to hold a municipal election in the smallest commune. It was easier to decree woman suffrage than to proceed with actual elections anywhere. At the close of the year 1945 both local and national elections were still in the future.

Liberation of the north increased the problems of Italian foreign policy. The fate of Italy's colonies had been uncertain after Churchill's declaration that the Italian empire was irretrievably lost. French troops occupied parts of Cuneo province and Frenchmen called for rectification of the frontier with Italy. In Bolzano province the *Südtiroler Volkspartei* asked for return to Austria. Marshal Tito quickly established occupying forces and Yugoslav military government in most of Istria including the city of Trieste early in May. The Italians of Venezia Giulia were cowed, but in the rest of Italy there was an outcry. On June 9 an agreement was signed by the United States, British and Yugoslav governments which provided for Allied military government in Pola and Trieste and the area west of a line from Trieste to the Austrian frontier, thus securing the lines of communication with Austria by way of Gorizia, Capo-

retto and Tarvisio. For the rest of the year the ultimate fate of Trieste was a source of great anxiety for the Italian government and people.

The meeting of the Big Three at Potsdam (Berlin Conference, *q.v.*) encouraged the hopes of Italians for a speedy negotiation of peace, but the meeting of the Council of Foreign Ministers at London (Sept. 11-30) was unable to agree on procedure. Italy continued to have uncertain status, a co-belligerent in the war against Germany but bound by the armistice terms and excluded from the United Nations, although diplomatic relations had been resumed with the United States, Great Britain, France and many other governments. Publication of the armistice terms on Nov. 7 served merely to discredit the extreme rumours about the nature of Italy's surrender to the Allies.

The Consultative National assembly opened its sessions on Sept. 25, elected Carlo Sforza its president, and prepared to give its advice to the ministry pending election of the constituent assembly. Meanwhile discontent increased for the disastrous drought had meant a very poor harvest, and Italy was in great need for food, coal and raw materials from the outside world.

Guglielmo Giannini's newspaper *L'Uomo Qualunque* (The Average Man) won great popularity in appealing to middle-class discontent. The Liberal party withdrew its support from the ministry and was followed by the Christian Democrats and on Nov. 24 Parri resigned, warning his successors of the danger of civil war. After much negotiation De Gasperi formed a cabinet on Dec. 10, not much different in its composition from its predecessor. On Dec. 31 the Allies announced the termination of A.M.G. in all of Italy except Venezia Giulia and the province of Udine. The December meeting of the foreign ministers of the Big Three at Moscow gave promise of a renewed attempt to conclude a definitive peace treaty with Italy. (See WORLD WAR II.)

**Education.**—Governmental and nongovernmental elementary schools (in 1941-42) numbered 139,571, with 5,110,328 pupils. In the 29 liberated provinces A.M.G. reported 18,000 elementary and secondary schools opened, with 1,200,000 students on March 15, 1945. Governmental and nongovernmental secondary schools (1941-42) numbered 5,136, with 556,260 students. In 1942-43 there were 29 royal universities and institutes, 6 free universities and institutes, with a total of 164,863 students. In June 1945, 27 royal universities were operating.

**Defense.**—The Italian army was reorganized and re-equipped by the Allies. The ceiling of the new army was fixed at 300,000. Six combat groups served with the Allies and suffered 11,000 casualties by the end of the war. Service troops numbered 175,000. The Italian navy and mercantile marine were placed at the disposal of the United Nations by the Cunningham-De Courten agreement of Sept. 23, 1943. Establishment of the navy was fixed at 80,000. The air force had about 31,000 officers and men with approximately 200 fighters, bombers and sea planes when the Allies assumed control. The reorganized air force had 5 squadrons of Allied fighter and bomber aircraft.

**Finance.**—The monetary unit is the lira; official rate 100 to the U.S. dollar. Estimated receipts for the fiscal year 1945-46 were 115,000,000,000 lire of \$1,150,000,000. Estimated expenditures were \$1,826,000,000. The national debt had risen from 105,709,000,000 lire in 1935 to 405,823,000,000 lire in 1943, and press statements of Nov. 28, 1945, indicated a national debt of approximately 1,000,000,000,000 lire or \$10,000,000,000. Notes in circulation were 285,000,000,000 lire and 81,000,000,000 A.M. lire. The active gold reserve totalled 2,237,000,000 lire in 1943. The Bank of Italy claimed the gold discovered at Fortezza (province of Bolzano) in May 1945.

**Trade and Communication.**—For Italy under Allied occupation, period until April 1945, exports were more than 163,000,000 tons and more than 1,627,000,000 lire (\$16,270,000), principally to the United States, the United Kingdom, France, North Africa and Malta. Leading items of export: mercury, perfume oils, citrous fruits, pumice, silk, lead, sulphur, block talc, briarwood, tartaric acid and hemp.

Imports came through army channels to meet the military responsibility of preventing disease and unrest. By spring of 1945, imports totalled 2,500,000 tons of supplies worth more than \$300,000,000 in estimated landed cost. By April 1945, 1,496,000 tons of food were imported, mostly wheat and flour.

State and private railway mileage (Dec. 31, 1942) was 14,590. On April 1, 1945, the Allies had in operation on the mainland (excluding the north) 4,772 mi. of Italian state railways. Motor vehicles included 333,900 licensed (Dec. 1942); telephones numbered 835,721 (June 30, 1942); telegraph lines totalled 43,036 mi. (1941-42); government broadcasting stations (1942) 16.

**Agriculture and Industry.**—There were no available data for the year 1945 for the country as a whole because of divided administration. (See also ALBANIA; ANTI-SEMITISM; FASCISM; ITALIAN COLONIAL EMPIRE; NAVIES OF THE WORLD.)

**BIBLIOGRAPHY.**—*Gazzetta Ufficiale del Regno* (texts of laws and decrees); *Annuario Statistico Italiano* (1944 and supplements); Public Relations Branch, Allied Commission, *A Review of Allied Military Government and of the Allied Commission in Italy* (1945).

**Ivory Coast:** see FRENCH COLONIAL EMPIRE.

**Iwo Jima.** A volcanic island in the North Pacific, a little more than 700 mi. southeast of Tokyo, irregularly shaped, about 5 mi. long, ranging in width from 800 yd. to  $2\frac{1}{2}$  mi., under Japanese sovereignty until 1945. Iwo Jima, a speck of volcanic ash in the huge Pacific ocean, was almost unknown

LANDING FLEET of more than 800 ships moving toward Iwo Jima during the invasion of Feb. 19, 1945. The island was taken in 26 days after a resistance unparalleled in the Pacific war

until it became the scene of one of the fiercest and most costly battles in United States history, measured in terms of the ratio of casualties to the number of men engaged.

The island possessed high strategic importance both for the U.S. and for Japan because it was the best available midway air base between Saipan, some 700 mi. further south, which U.S. forces had captured in 1944, and Tokyo, one of the main objectives of Superfortress raids. It was also used as a radar centre to give warning of approaching U.S. raids. A garrison of some 20,000 of Japan's best troops held the island and made the most of such natural defensive features as the caves with which the volcanic hills are honeycombed. U.S. air reconnaissance uncovered 185 big positions and the Japanese had constructed more than 800 pillboxes. The Japanese had entrenched themselves so effectively in caves with interlocking tunnels that weeks of preliminary bombardment failed to weaken appreciably their ability to offer desperate and tenacious resistance.

Three marine divisions, under command of Gen. Holland M. Smith, landed on Iwo Jima between Feb. 19 and 21, 1945. The Japanese fire directed against the beaches was heavy and accurate. The struggle for the possession of the island continued for almost a month and was necessarily carried on at extremely close quarters. There were no tranquil rear stations to which exhausted units could be sent for recuperation.

The hardest struggles were for the occupation of Meatgrinder hill, in the northern part of the island, and of Mount Suribachi, a sulphurous, steaming volcano which rises 546 ft. above sea level in a southern corner of the island. The former position was taken and lost five times before the marines held it permanently. The raising of the U.S. flag over Mount Suribachi was one of the most dramatic episodes in the Pacific war.

The island was officially pronounced captured on March 16, 1945. Nearly all the 21,000 Japanese defenders were dead. U.S. losses were reported as 4,287 dead and missing and 19,540 wounded. The Japanese commander, Gen. Tadamichi Kurabayashi, declared: "This island is the front line that defends our mainland, and I will die here." He was killed leading a charge. As late as March 26, 1945, some 200 hidden Japanese rushed out and overran the airfield before they were destroyed.

Iwo Jima subsequently served as a useful advance base for B-29 raids against Japan. Unlike neighbouring volcanic islands, one of which emerged from the ocean only to disappear again, Iwo Jima developed a small plateau and a red clay surface which was advantageous for the construction of an air strip. (See also WORLD WAR II.) (W. H. CH.)

**Jackson, Robert Houghwout** (1892— ), U.S. jurist, was born Feb. 13 at Spring Creek, Pa. Following his graduation from Albany Law school, he was admitted to the New York bar in 1913 and practised law in Jamestown, N.Y. As counsel and in official capacities, he served railroad, banking and telephone interests. The year 1934 found him in Washington, D.C., as general counsel for the bureau of internal revenue. By appointment of President Roosevelt, he served as U.S. assistant attorney-general (1936-38) and as solicitor-general of the U.S. (1938-39). In Jan. 1940, President Roosevelt named him U.S. attorney-general, and on June 12, 1941, he was made an associate justice of the U.S. supreme court. On May 2, 1945, President Truman named Justice Jackson as chief U.S. counsel on the international military tribunal to try axis war criminals. Justice Jackson said (July 6) that the four big powers, the U.S., the U.S.S.R., Great Britain and France, had agreed that the accused would be entitled to a fair hearing but warned that the defendants would not be permitted to use obstructionist tactics to defeat the trials. The trials got under way Nov. 20 at Nuernberg, Germany, and, acting as

chief prosecutor for the U.S., Jackson made the initial statement for the prosecution, charging that the 20 nazi defendants on trial were responsible for World War II. On Dec. 4, Justice Jackson, replying to a charge in the *Army and Navy Journal* that he was trying to slur the military profession, said the Allies were prosecuting these militarists "not for fighting a war, but for promoting one."

**Jamaica:** see WEST INDIES, BRITISH.

**Japan.** An empire in the western Pacific, under United States military occupation from Sept. 1945, including the four large islands—Honshu, Hokkaido, Shikoku and Kyushu and many adjacent smaller islands. In conformity with the terms of the Cairo declaration of 1943, and following Japan's surrender in Aug. 1945, all the former overseas possessions of the Japanese empire were removed from Japanese control. Korea (*q.v.*) (Chosen) was supposed to become independent after a period of four-power trusteeship not to exceed five years, according to the agreement reached at the Moscow conference of foreign secretaries of the U.S., the soviet union and Great Britain in Dec. 1945. Formosa (*q.v.*) (Taiwan) was to be returned to Chinese rule; the soviet union had occupied South Sakhalin and the Kurile Islands; Dairen and the Kwantung leased territory were to revert to China, and at the end of 1945 were under soviet occupation. No final disposition had been made in 1945 as to the disposition of the South Pacific island groups—the Marianas, Caroline and Marshall or the Ryukyu Islands.

Population of Japan proper (census of 1935) 69,254,148. As of Oct. 1, 1939, the population was estimated as 72,875,800, and as of Aug. 31, 1945, the population was 77,997,642 according to a survey of the home ministry (based on data from the Cabinet statistics council). The Japanese islands would apparently have to absorb several million Japanese, soldiers and civilian residents of Manchuria, Korea, China and other overseas countries, who were to be repatriated.

Japan's six largest cities with estimated 1939 populations are: Tokyo (capital) (*q.v.*) (6,581,000); Osaka (3,394,200); Nagoya (1,249,100); Kyoto (1,177,200); Kobe (1,006,100); Yokohama (866,200). All these cities except Kyoto suffered heavily in U.S. air raids, and there was probably a considerable flight of people to the country districts. Buddhism is the principal religion, followed by Shintoism, the indigenous faith of Japan. There were 41,127,307 Buddhists in Japan in 1936; 16,525,840 Shintoists, 215,166 Japanese Christians of Protestant denominations, 111,856 Roman Catholics and 41,251 Greek Orthodox believers in 1938. U.S. and British missionary work was, of course, suspended after the outbreak of World War II, but Japanese Christian churches continued to function in an atmosphere of some difficulty and suspicion. Contacts between U.S. and Japanese Christian churches were resumed after the surrender.

The Japanese sovereign is Emperor Hirohito (succeeded to the throne Dec. 25, 1926). Prime minister (after Oct. 1945) Baron Kijuro Shidehara.

**History.**—World War II, in which Japan was increasingly overmatched by the superior air, naval and military power of the United States, roared to its inevitable climax in 1945. Japan surrendered before its home islands were invaded and while large intact Japanese armies were stationed in China, in south-eastern Asia and in some of the Pacific islands.

The year's military operations began when General MacArthur's forces landed in Luzon, on Jan. 9, 1945, and advanced toward Manila, capital of the Philippines. Manila fell on Feb. 23, and subsequent operations in the Philippines were in the nature of "mopping up."

Marines landed on Feb. 19 on volcanic Iwo Jima, an irreg-

ularly shaped island only 700 miles of air line distance from Tokyo. The struggle for this island was one of the bitterest in the far eastern war and cost 20,000 U.S. casualties. After 26 days of fighting Iwo Jima was taken, and the U.S. air force possessed an advanced base from which bombings of Tokyo and other Japanese industrial centres could be intensified.

The next military forward step was the invasion of the Ryukyus, a chain of islands which stretch out in a southwestern direction from Kyushu, southernmost of the four main Japanese islands.

The struggle for Okinawa, one of the larger islands of the Ryukyu group, was longer and more costly in lives than the battle for Iwo Jima. It began on April 1, 1945, and ended on June 21. U.S. casualties were stated as 39,000 and there was a considerable amount of loss and damage to U.S. shipping because of Japanese tactics of suicide crash-diving against the concentrations of shipping which were necessary to support the invasion. Nearly 100 Allied ships were lost or damaged off Okinawa.

The tide was flowing against Japan in other theatres. China, which had taken a severe battering from Japanese armies in 1944, began to strike back at the long Japanese line of communications from Manchuria to Indo-China. British forces completed the reconquest of Burma, taking Mandalay in March 1945 and Rangoon in May. Australian forces had landed at various points in Borneo between May and July.

General MacArthur announced the complete liberation of

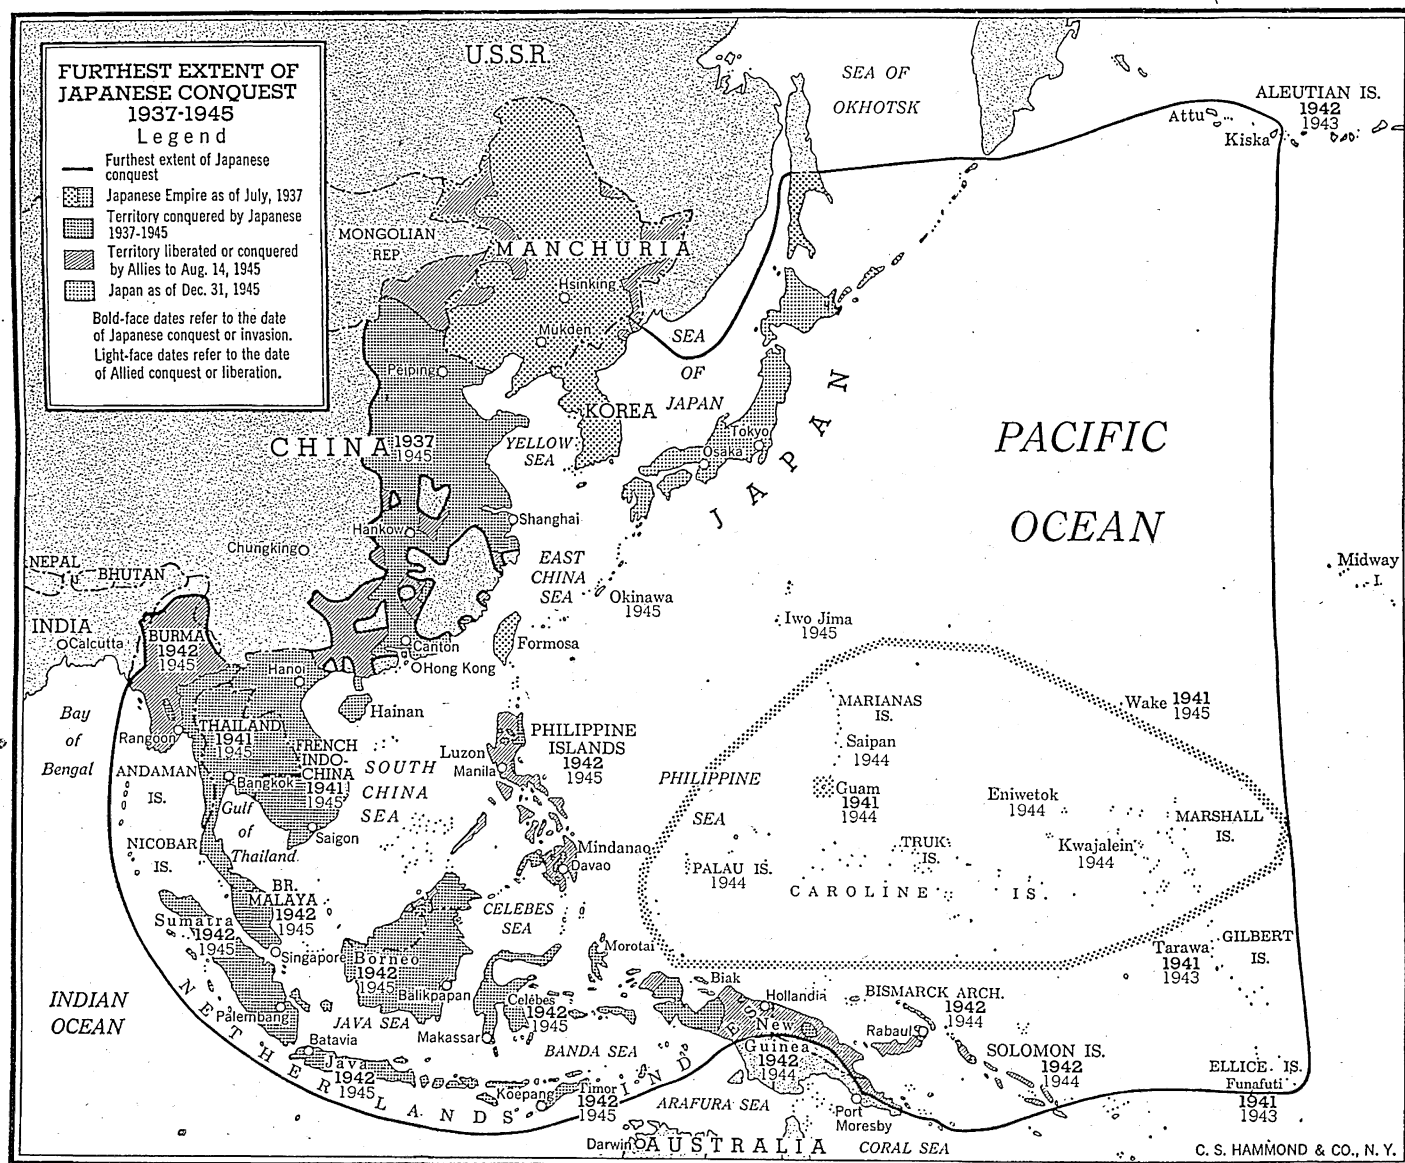

the Philippines on July 5. There was little Japanese resistance to a merciless pounding of Japan's cities and shores by swarms of B-29s and by the 3rd fleet of Admiral William F. Halsey during July.

Toward the end of the Potsdam (Berlin) conference, on July 26, 1945, Japan received a demand from President Truman, Winston Churchill and Generalissimo Chiang Kai-shek to surrender or face destruction. The proclamation warned that the United Nations were "poised to strike the final blow at Japan." The Japanese prime minister, Admiral Kantaro Suzuki, a moderate who had replaced General Kuniaki Koiso in this office earlier in the year, announced that the Potsdam ultimatum would be ignored.

But August proved to be the climacteric month in the far eastern conflict and, consequently, in World War II. A new weapon of unprecedented destructiveness, the atomic bomb, was dropped on the city of Hiroshima on Aug. 6. Hiroshima and its population were largely obliterated by this single terrific missile.

The Soviet Union, which had given notice of intention to terminate its treaty of nonaggression with Japan in April, 1945, declared war on Aug. 8 and launched military operations against Manchuria, Korea, Southern Sakhalin and the Kuriles. A second atomic bomb, of even greater devastating power, was dropped on Nagasaki on Aug. 9.

The impact of this second bomb was apparently decisive. The Japanese government, approaching the U.S. government through

AMONG THE FIRST occupation troops to arrive in Japan were these U.S. marines of the sixth division, landing near Tokyo on Aug. 30, 1945

the Swiss legation, announced its willingness to accept the terms of the Potsdam proclamation "with the understanding that the said declaration does not comprise any demand which prejudices the prerogatives of His Majesty as a sovereign ruler." The salient passages in the reply of Secretary of State James F. Byrnes were as follows:

From the moment of surrender the authority of the Emperor and the Japanese Government to rule the state shall be subject to the Supreme Commander of the Allied Powers, who shall take such steps as he deems proper to effectuate the surrender terms . . .

The ultimate form of government of Japan shall, in accordance with the Potsdam Declaration, be established by the freely expressed will of the Japanese people.

On the evening of Aug. 14, 1945, President Truman announced that Japan had surrendered unconditionally. After preliminary occupation measures were taken the surrender was formally carried out on the U.S. battleship "Missouri" on Sept. 2. Foreign Minister Mamoru Shigemitsu signed on behalf of the emperor. Representatives of the United States, China, the United Kingdom, the Soviet Union, Australia, Canada, New Zealand, the Netherlands and France signed on behalf of the victorious powers.

While the surrender amounted to acceptance of a hopeless military situation in which Japan, without any hope of an ally or a new source of strength, faced destruction at the hands of the world's strongest military powers, it was carried out at the insistence of Emperor Hirohito against the protests of some military die-hards. The war minister, General Korekichō Anami, and Vice-Admiral Takejiro Onishi, originator of the *kamikaze* ("divine wind") suicide airplane tactics, committed *hara-kiri* in ceremonial Japanese fashion after the surrender. A relative of the emperor, Prince Naruhiko Higashi-Kuni, was appointed prime minister, partly in the calculation that his prestige as a member of the imperial family would expedite the surrender of Japanese forces in remote outposts, whose commanders were sometimes imperfectly informed about the desperate situation in the Japanese homeland. Surrenders of the far-flung Japanese armies and garrisons took place without any special incident and the U.S. occupation of Japan until the end of 1945 proceeded

without serious clashes or friction between the troops and the Japanese civilians.

**Casualties and War Damage.**—Official reports of the Japanese government gave the following summary on Aug. 23, 1945: civilians killed, 241,309; injured, 313,041; "war victims" (*i.e.*, dead, injured or homeless), 8,045,094; buildings completely burned out or destroyed, 2,333,388; buildings partly burned out or destroyed, 110,928. An official report to the diet on Sept. 9 stated that bombing destroyed more than 30% of the buildings in 81 of Japan's 206 cities. In 42 cities a majority of the buildings were destroyed. Tokyo prefecture suffered most heavily in life and property loss, with Hiroshima and Nagasaki, respectively, second and third worst hit. An area approximating 1,215 sq.mi. in 95 principal cities was devastated by bombing.

**Occupation Policies.**—Until the end of 1945 the occupation of Japan was a U.S. enterprise. Supreme authority was vested in the hands of General MacArthur. Instead of setting up a system of direct U.S. military government, General MacArthur issued directions to the Japanese government, which continued to function instead of being suspended, as in Germany.

Some hundreds of Japanese, ranging from prominent political and military leaders to prison guards accused of brutality toward prisoners of war, were arrested on the suspicion of being war criminals. General Tomoyuki Yamashita, conqueror of Malaya and subsequently commander of the Japanese forces in the Philippines, was convicted by a U.S. military court in Manila of failing to prevent atrocities by troops under his command and sentenced to be hanged. The former prime minister, Prince Fumimaro Konoye, committed suicide after being placed under house arrest. Another former prime minister, General Hideki Tojo, who headed the cabinet at the time of the attack on Pearl Harbor, unsuccessfully tried to kill himself before he was taken into custody.

Political prisoners were released from the Japanese jails and the special political police was abolished. Freedom of the press was upheld as an ideal, but Japanese newspapers remained subject to U.S. military censorship. Directions issued by General MacArthur to the Japanese authorities called for the breaking

EMPEROR HIROHITO viewing the desolation in Fukugawa Ward, Tokyo, after concentrated bombing by U.S. Superfortresses. Photograph was taken during the war, and obtained from a Japanese source in 1945

up of some of the big interlocking monopolies in business and finance and for agrarian reform looking to the relief of tenant farmers and the discouragement of absentee ownership.

A sweeping revision of Japanese historical books, including the destruction of textbooks containing chauvinistic and mythological statements, was ordered. The government was also instructed to discontinue financial and other aid and encouragement to state Shinto, which was considered a factor in inspiring aggressive tendencies in the Japanese mind. A rather spectacular climax to this hacking away at the roots of the old imperial system was provided when Emperor Hirohito repudiated both his own divinity and any "master race" claims for the Japanese people in a New Year message to his people.

Women's suffrage, a radical innovation in a society so male-centred as the Japanese, was introduced and the Japanese people were to go to the polls early in 1946 to elect a new diet. Four parties, ranging from right to left in the following order—Progressive, Liberal, Social Democratic and Communist—figured most prominently in the pre-election agitation. The traditional parties of Japan, the Seiyukai and the Minseito, were apparently discarded.

A new system for international control of Japan was agreed on at the Moscow conference in Dec. 1945. A far eastern commission, composed of representatives of the United States, the soviet union, the United Kingdom, China, France, the Netherlands, Canada, Australia, New Zealand, India and the Philippine commonwealth, was set up for the purpose of "formulating the policies, principles and standards in conformity with which the fulfilment by Japan of its obligations under the terms of surrender may be accomplished." The United States, the soviet union, Great Britain and China, were to enjoy a veto right in the commission. Headquarters of this commission were to be in Washington, D.C.

At the same time an Allied council for Japan, composed of representatives of the United States, the soviet union, the United Kingdom and China, was to be set up in Tokyo "for the purpose of consulting with and advising the supreme commander in regard to the implementation of the terms of the surrender, the occupation and control of Japan and of directives supplementary thereto; and for the purpose of exercising the control authority herein granted." Chairman of this council was to be the supreme commander for the Allied powers or his deputy.

**Education.**—There were 48,637 schools of all types in Japan in 1938, with 15,638,780 pupils and students. There were 563 middle schools (more or less equivalent to U.S. high schools), with 364,486 students, and 45 universities with 6,385 professors and 72,968 students. Elementary literacy in Japan is more than 99%, because a six-year elementary school course is free and compulsory. Education in Japan suffered considerably during World War II, first because of the mobilization of students for war work, second because of the destructive bombings. More than 4,000 schools of all types, including 20 universities and 80 colleges, were destroyed by bombing according to a statement by Tamon Maeda, minister of education, in Sept. 1945.

**Finance.**—The unit of currency is the yen (officially valued at 23.48 U.S. cents before the beginning of the war in the Pacific). The yen was sliding downward rapidly in terms of purchasing power after the end of the war and Japan evidently faced a serious inflationary situation. The amount of currency in circulation increased from 27,000,000,000 yen to 44,000,000,000 yen between July and Oct. 1945. Currency in circulation on Sept. 30, 1941, was 4,619,000,000 yen.

The Bank of Japan is the central bank of note issue. The Yokohama Specie Bank is in charge of foreign exchange transactions, which were very limited, of course, after the outbreak of World War II. It also finances foreign trade. Commercial banking is largely in the hands of seven large banks—the Mitsui, Mitsubishi, Dai-ichi, Sumitomo, Yasuda, Dai-Hyaku and Sanwa. Two of these, the Dai-ichi and Mitsui, merged in 1944 to form a new institution, the Teikoku Ginko, or Imperial bank.

**Trade and Communication.**—The last published trade figures for Japan, excluding its former colonies, were as follows:

	1939 (yen)	1940 (yen)
Imports	2,917,000,000	3,709,035,000
Exports	3,576,000,000	3,972,400,000

Japanese foreign trade dwindled almost to the vanishing point, apart from countries which were under Japanese military and political control, after the United States, the United Kingdom and the Netherlands virtually broke off trade relations with Japan in July 1941, following the Japanese occupation of southern Indo-China. There was a little irregular trade with China, a trickle of goods exchange with the soviet union and an occasional exchange of blockade-running cargoes with Germany. There was little revival of Japan's foreign trade up to the end of 1945.

At the end of 1939 Japan possessed 4,084 ships of more than 100 tons, with an aggregate of 5,728,779 tons. As of Sept. 30, 1938, there were 17,791 sailing ships with an aggregate of 1,046,476 tons. As a result of war attrition, the Japanese merchant fleet by the end of World War II was reduced to 1,000,000 or 1,500,000 tons, "counting all very small ships and a very few suitable for long voyages," according to a statement after the Japanese surrender by Admiral Forrest P. Sherman, deputy chief of staff for Admiral Chester Nimitz.

Commercial aviation in Japan was in the hands of a semigovernmental monopoly, the Japan Airways company, capitalized at 100,000,000 yen. The length of its routes in 1938-39 was about 10,000 mi. The number of flights was 17,144; the aggregate length of flights 3,788,023 mi.; the number of passengers carried 69,268; the quantity of goods conveyed 328 tons; the amount of mail carried 903 tons. In 1945 it was thought that Japanese commercial aviation, if permitted at all, would in the future be restricted to the Japanese home islands.

There were 13,648 telegraph stations in Japan in 1939, and 75,838,875 domestic and 1,261,295 foreign messages were handled in 1938-39. The length of the inland telegraph lines was 259,709 mi. in 1938. There were 6,197 telephone exchanges in Japan on Sept. 30, 1939, and 1,006,498 subscribers for telephone service.

**Agriculture.**—Because of the pressure of population on the limited amount of arable land (only about 15% of Japan's surface area is suitable for cultivation) Japan is a land of small rice and silk farms and fishing villages. There is almost no large-scale farming with modern machinery and very little animal husbandry except in the northernmost island, Hokkaido. There were 5,519,480 farm households in 1938, and

#### Agricultural Production in Japan, 1940

	Cultivated area (acres)	Yield (in short tons)
Rice	7,837,888	9,999,308
Wheat	2,078,023	1,445,581
Barley	840,941	829,508
Rye	999,599	690,297

the amount of land under cultivation was about 15,000,000 ac., the average size of the holding being less than three acres. Rice has always been Japan's largest crop and represented about half the value of the national agricultural production in 1939. The total reported value, excluding meat, milk and eggs, on which no data were given and which do not figure largely in Japan's farm output, was 5,614,000,000 yen. The value of the rice produced in that year was 2,874,000,000 yen. The value of silk cocoons produced in 1939 was 883,000,000 yen. There was in 1945 a debate as to whether silk should be raised for export or whether the land formerly planted with mulberry trees should be put under cultivation for food crops. The estimated output of silk for 1945 was 120,000 bales as compared with 536,225 bales in 1941. There were 1,894,261 cattle, 1,140,479 swine, 114,000 sheep and 281,741 goats in Japan in 1938, and 1,431,920 horses in 1936.

**Manufacturing.**—There were 112,332 factories employing more than five persons each in Japan in 1938, with a total of 3,604,283 workers and an output of 19,667,219,686 yen. The most important industries and the value of their output in 1938 were as follows: metal (4,687,166,000 yen); spinning and weaving (3,984,829,000 yen); machinery and tools (3,821,881,000 yen); chemicals (3,460,581,000 yen); foodstuffs (1,786,275,000 yen). From 1931 until the terrific destruction by bombing set in there was a considerable expansion of the "heavy" industries—metal, machine-building and chemical, which were adaptable to war purposes. There were 1,442,713 persons engaged in fishing in 1938, and this was an important occupation both for domestic food supply and for export. It was later greatly reduced, because the waters around Japan were strewn with mines by the B-29s and there was a shortage of gasoline for the fishing boats.

**Minerals.**—Japan is poor in natural resources. Its principal minerals and their annual output as of 1936 were: coal 41,803,000 metric tons; gold (784,308 oz.); copper (85,950 metric tons). Publication of these statistics was suspended after 1936. Mineral output was 20% higher on a quantity basis in 1939 than it was in 1936. (See also FASCISM; NAVIES OF THE WORLD; UNITED STATES; WORLD WAR II.)

**Jewish Religious Life.** The end of World War II revealed how disastrous to Judaism had been the atrocities of Hitlerism. In continental Europe, few Jewish children survived, and the exhausted adult survivors in the underground movements or in displaced persons camps were seen to be for the most part without communities, synagogues, religious or Jewish educational institutions or ritual articles. Outside of soviet Russia, only 1,500,000 Jews remained in Europe; 5,000,000 were destroyed. A typical figure is that from Leipzig, Germany, where of 16,000 Jews, 16 survived, and they only because they were married to Christians and were bringing up their children as Christians. Of the 3,500,000 Jews of prewar Poland, there remained but 80,000, scattered, starved and still being pogromized. In western Europe there was some hope of rebuilding Jewish communities; but in central and eastern Europe the shadow of extinction loomed over what were before the war the greatest centres of Jewish learning and of intensely lived Judaism.

There were some encouraging incidents during 1945. Thus, when the first service was held in the reopened Amsterdam synagogue, four-fifths of the congregation was made up of Christians who came to show their sympathy with the Jewish survivors. In Bergen, Oslo and Trondheim, Norway, the surviving Jews were given money seized from German accounts to help them repair their synagogues. But attempts to reorganize Jewish life were generally hampered by the utter poverty that gripped so much of Europe, indoctrinated nazi anti-Semitism, and the unwillingness to give back to Jews seized Jewish property. Thus, at Maastricht, Netherlands, the community planned for U.S. Jewish soldiers a celebration of the Biblical festival of Purim; but it was disapproved of lest it stir up additional anti-Semitism. When at Dachau, Germany, a U.S. Jewish chaplain attempted to hold an open-air religious service, the Jewish displaced persons declared that it would lead to disorders. In the Belsen camp, Polish internees smashed the synagogue set up by the Jewish displaced persons and desecrated the Torahs and prayer books.

This atmosphere in postwar Europe tended to drive the surviving Jews to one of two extremes—either a flight from Judaism, dramatized by the conversion to Catholicism of the chief rabbi of Rome, or an intensification of Jewishness which makes the overwhelming majority of the Jewish displaced persons want to settle down only in Palestine. The failure of the British Labour government to live up to British pledged policy of facilitating the establishment in Palestine of a Jewish national home stirred a reaction of a far more militantly determined Zionism in Palestine, in the Jewish people generally, and in the congress of the United States which by an overwhelming vote called for the fulfilment of the international pledge to make a reality of Zionism.

In the United States, the greatest free Jewish community

in the world, there was a notable growth of orthodox Jewish schools, and overseas rescue work by orthodox groups. All the Jewish theological seminaries launched plans for extension of their work to help take the place of the destroyed centres of Jewish learning in the old world. (See also ANTI-SEMITISM.)

**BIBLIOGRAPHY.**—*The Contemporary Jewish Record* (1945); *American Jewish Year Book* (1944-45); *Reports of the American Jewish Joint Distribution Committee*. (D. DE S. P.)

**Jewish Welfare Board, National.** The National Jewish Welfare board (J.W.B.), organized in 1917 to meet the religious, cultural and welfare needs of Jewish servicemen of the United States, fulfilled that mission through the eventful year which saw the defeat of Germany and Japan. Accredited by military authorities to work with the armed services, J.W.B. represented 38 national Jewish organizations, comprising all groups of the American Jewish community.

A member organization of U.S.O., J.W.B. in 1945 directed and co-operated in the operation of 174 U.S.O. facilities. In the United States, 623 local J.W.B. army and navy committees served men and women in the armed forces, and 58 committees conducted hospitality activities overseas.

More than 300 professional workers supplemented thousands of volunteer workers.

The board enlisted and endorsed rabbis for service as army and navy chaplains—288 saw duty in the services; it recruited civilian rabbis to serve where chaplains were not available; it extended aid in personal and spiritual problems to patients in general hospitals. Accredited by the Veterans' administration of the United States, J.W.B. employed 20 professional workers to assist discharged servicemen in connection with claims for benefits. It provided rabbis for service at Veterans' facilities. The board's Bureau of War Records, engaged in compiling facts on Jewish participation in the war effort, published the second volume of its work, *Fighting for America*, a book listing Jewish casualties, the names of those who had been decorated, and containing stories and pictures of servicemen of Jewish faith in combat.

J.W.B., as parent body for 290 Jewish community centres, Y.M.H.A.'s and Y.W.H.A.'s and similar groups in the United States and Canada, with a total membership of more than 411,000 men and women, young people and children, assisted these local groups to plan programs of recreation, educational activities and Jewish culture for their members. It also gave counsel on administration and personnel problems, building and membership campaigns.

The J.W.B. national council, consisting of delegates of the affiliated and co-operating organizations, constituent local Jewish centres, army and navy and Jewish centre regional groups, and the professional Jewish centre workers' organization represents all phases of J.W.B. activity. The board of directors is similar in pattern, including, in addition to J.W.B. officers, the chairmen of the national divisions and members at large. An executive committee functions between meetings of the board.

Annual national council meetings were suspended for the duration of World War II in April 1942. Authority was delegated to the board of directors and the executive committee. A meeting of the national council was planned for April 1946.

Officers in 1945 were: Frank L. Weil, president; Lloyd W. Dinkelspiel, Irving Edison, Mrs. Walter E. Heller, Carl M. Loeb, Jr., Donald Oberdorfer, Walter Rothschild, Mrs. Felix M. Warburg, vice-presidents; Max Wilner, treasurer; Merwin R. Haskel, assistant-treasurer; Joseph Rosenzweig, secretary; Ralph K. Guinzburg, assistant-secretary; Louis Kraft, executive director. Offices in 1945 were at 145 East 32nd street, New York city. (F. L. W.)

**Jiménez Oreamuno, Ricardo** (1859–1945), Costa Rican statesman, was born Feb. 6 at Cartago, Costa Rica. Jiménez, whose father and grandfather had served as presidents of Costa Rica, turned to politics after graduating from law school in 1884. He served as minister to Mexico, Nicaragua and El Salvador, attended the Central American congress in 1888 as minister plenipotentiary, and was foreign minister of his country in 1889. He also held the portfolios of the interior, public works, public instruction and the treasury, was thrice elected to congress and served as vice president of the republic. He was also president of congress and chief justice. The only president of Costa Rica to serve three full terms, 1910–14, 1924–28 and 1932–36, he was faced with a rebellion shortly after his last election, instigated by one of the two defeated presidential candidates. Some 25 persons were killed in the uprising which subsequently was settled with a peace parley held in the U.S. legation. He died Jan. 4, according to a San Jose report.

**Jodl, Alfred** (? – ), German army officer, served with the Bavarian army during World War I. After the armistice in 1918, he was attached to the ministry of war and later with the German intelligence service. Jodl, who was a colonel in 1935, was advanced to the rank of a major general by 1939 and was a colonel general throughout most of World War II. In late 1940, Franz von Halder strongly opposed a German attack on the soviet union, and as a result Jodl replaced von Halder, first as the fuehrer's chief military adviser (Oct. 1942) and then as chief of staff. Jodl headed the German delegation that signed the German surrender at Gen. Eisenhower's headquarters in Reims, France, May 7, 1945. On June 21, an Allied intelligence officer who had questioned the German general quoted Jodl as saying that German plans to invade Britain in 1940 were cancelled because of hazards and lack of training. He also asserted that Germany's failure to contain the Allied invasion of Normandy was due to the fact that the wehrmacht, expecting a second and stronger thrust, had held the German 15th army in reserve too long and failed to reinforce the German 7th army until too late. Jodl went on trial with a score of other high-ranking Germans at Nuernberg on charges of committing war crimes, in Nov. 1945.

**Johns Hopkins University.** An institution of higher education at Baltimore, Md., president, Isaiah Bowman. Termination of World War II made it possible for the first time to disclose some of the university's wartime activities. More than 100 separate research projects were undertaken from 1941 through 1945. Largest was the proximity fuze project which was carried on by the university at a separate laboratory in Silver Spring, Md. There were 1,200 people employed on the project. Along with several other universities, Hopkins received a special citation from the secretary of war for essential research in the development of the atomic bomb. Many of the projects were in the school of medicine and contributed substantially to the record of the institution's medical services during the war. Termination of the war brought a rapid increase in undergraduate enrolment due to veterans returned from service. Final plans were approved for a revised collegiate curriculum which involves a refinement of the group system which was in use at Hopkins from 1933. The new curriculum would emphasize the importance of each student coming into contact with each of the three major branches of learning—the natural sciences, the social sciences and the humanities. (For statistics of enrolment, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (I. Bo.)

**Johnson, Hiram Warren** (1866–1945), U.S. politician, was born Sept. 2, at Sacramento, Calif. The one-time lawyer and governor of California, 1911–17, was elected five times to the U.S. senate, serving from 1917 to 1945. See *Encyclopædia Britannica* for his early career. His isolationist views marked his political thinking through two wars, and influenced the United States against entering the League of Nations after World War I. He continued to exhort against U.S. "embroilment" in an international peace organization during World War II. During the debate in the senate's foreign relations committee, of which he was ranking minority member, he cast the lone vote against sending the United Nations Charter to the senate without alteration. When the senate ratified the charter, July 28, 1945, by an 89-to-2 vote, Sen. Johnson was very ill. He declared, however, that if he had been present during the voting he would have cast a dissenting vote. He bolted his party to support Franklin D. Roosevelt for the presidency in 1932, warning that the country would "go to hell economically" unless Roosevelt were elected. But Sen. Johnson opposed the president's candidacy for a third term. He voted against the administration on numerous bills that he thought would entangle the U.S. in foreign affairs. He opposed the reciprocal trade agreements, relaxation of the neutrality act, peacetime selective service and lend-lease. He also objected to any relaxation of the arms embargo that would permit sale of U.S. weapons to Great Britain and France on a cash-and-carry basis. Sen. Johnson died at a naval hospital near Washington, D.C., Aug. 6.

**Johnston, Eric A.** (1896– ), U.S. industrialist, was born Dec. 21 in Washington, D.C. After working his way through the University of Washington, Seattle, Wash., where he received the LL.B. degree in 1917, he served as a captain in the marine corps from 1917 to 1922. On receiving a medical discharge because of an injury suffered in China, he returned to Spokane. After a number of years as a successful business executive, he was elected president of the Chamber of Commerce of the U.S. in 1942. In February and March 1943, in his role as chairman of the U.S. Commission of Inter-American Development, Johnston made a 20,000-mi. aeroplane trip through seven countries of South America, conferring with government leaders and businessmen on plans for postwar economic co-operation. In Aug. 1943, at the invitation of Lord Halifax, he visited England, where he urged that postwar world trade be based to the maximum extent on free competitive enterprise. In the summer of 1944, Johnston spent six weeks in Russia, exploring postwar trade possibilities and wrote a number of articles on his impressions of the soviet union and its future place in world economy. He was a member of the Economic Stabilization board, the Economic Advisory committee of the state department, and was on the board of trustees of the Committee for Economic Development. On March 28, 1945, Johnston, together with A.F. of L. and C.I.O. leaders, signed the business-labour postwar peace charter which outlined principles designed to establish postwar industrial harmony. The charter was acclaimed by Pres. Roosevelt, Henry J. Kaiser and the National War Labor board, but was criticized as "premature" by the National Association of Manufacturers. Johnston resigned his post as president of the Chamber of Commerce to become president of the Motion Picture Producers and Distributors of America, Inc., Sept. 19, succeeding Will H. Hays.

**Joint War Committees** (U.S. and Canada): see CANADIAN-U.S. WAR COMMITTEES.

**Jones, Jesse Holman** (1874- ), U.S. secretary of commerce, was born in Robertson county, Tenn., on April 5. He engaged in extensive real estate operations in Texas and bought control of the *Houston Chronicle*, of which he was publisher. President Hoover appointed him a director of the Reconstruction Finance corporation in 1932 and he became chairman the following year. In July 1939 Jones was appointed administrator of the Federal Loan agency. On Sept. 13, 1940, President Roosevelt nominated him secretary of commerce. Jones came under fire in 1942 when the Truman committee of the senate blamed him for much of the rubber shortage. On June 29, 1943, Vice-President Henry A. Wallace, chairman of the Board of Economic Warfare, attacked Jones violently for alleged failures to supply funds to acquire critical materials. Jones retaliated forcefully, and the president then eliminated the Board of Economic Warfare and rebuked both Wallace and Jones for their "acrimonious public debate." On Jan. 21, 1945, Jones disclosed that he had been requested by Pres. Roosevelt to give up his government posts in favour of Henry A. Wallace and that he acceded. However, he criticized the choice of Wallace, whom he described as a man "inexperienced in business and finance" and as an unsuitable candidate for the department of commerce. Wallace's candidacy for the RFC post was subsequently rejected, but the senate confirmed him as secretary of commerce.

**Jong, Jan de** (1885- ), cardinal archbishop of Utrecht, was born at Nes, off the shore of the province of Friesland, Holland, on Sept. 10. He was ordained in 1908; made theological studies in Rome; and was professor of history in the major seminary of Ryzenburg. Named auxiliary bishop of Utrecht on Aug. 3, 1935, in 1936 he succeeded Archbishop Janssen as ordinary of that see. Archbishop de Jong took a bold stand against co-operation with the nazis during the occupation of the Netherlands in World War II. He refused to allow church services to be broadcast over German-controlled radio stations. Under his direction the priests of the archdiocese tenaciously refused attendance of young storm troopers at Catholic schools, and he refused the sacraments of the church to any member of a Dutch nazi-controlled party. On Dec. 23, 1945, Archbishop de Jong was nominated to the College of Cardinals by Pope Pius XII. He was created and proclaimed cardinal at consistory on Feb. 18, 1946.

**Jute.** The supply of jute for bagging and other uses in the United States continued to be restricted in 1945. Of the normal imports more than 80% comes from India. Efforts to develop substitute bag materials were continued and paper bags were used for many products such as seeds and fertilizers that formerly were handled in jute bags. Imports of jute in 1945 increased over the 142,912,000 lb. imported in 1944. The jute crop of India increased in 1945 to 2,408,000 ac. compared with 2,104,000 ac. in 1944 and production was expected to reach a total of 2,866,000,000 lb. compared with 2,480,000,000 lb. in 1944. With restoration of shipping the available supply was expected to meet normal requirements. (J. C. Ms.)

**Juvenile Delinquency:** see CHILD WELFARE; CRIME; FEDERAL BUREAU OF INVESTIGATION.

**Kaiser, Georg** (1878-1945), German playwright, was born Nov. 25, at Magdeburg. His plays, many of which carried a social message, were highly successful, commercially as well as artistically. He enjoyed popularity in Germany for more than a decade, but when Hitler came to power the writer fled to Switzerland. His works, notably *From Morn to Midnight*, *The Phantom Lover* and *Gas*, were produced in England and the United States. His production, *Mississippi*, shown in Berlin in 1931, was a sympathetically conceived drama based on a country-city conflict. Among his later works are *Es ist genug* (1932) and *Vera* (1939). He died in Ascona, Switzerland, June 5. (See *Encyclopædia Britannica*.)

**Kalish, Max** (1891-1945), U.S. sculptor, was born March 1 in Poland, and emigrated to the United States with his family when he was a child. He studied art in Cleveland, Ohio, at the National Academy of Design in New York city and in Paris schools. Kalish drew inspiration from the working men of America, asserting that "not religion or beauty, but engineering and industry are moving the world," and his sculpture frequently reflected this philosophy. Among his notable works are a bronze figure of Christ and a figure of Lincoln which he made for the city of Cleveland in 1927. In later years, Kalish concentrated on "apartment size" bronze statuette portraits, 18 or 20 inches high. His statuettes of "Fifty Great Men of 1944," on exhibition at the Smithsonian institution in Washington, D.C., at the time of his death, included portraits of Franklin D. Roosevelt, Frank Knox, Wendell Willkie, Raymond Clapper, General George C. Marshall and Ernie Pyle. Kalish was an associate of the National academy. He died in New York city on March 18.

**Kameroots:** see BRITISH WEST AFRICA; FRENCH COLONIAL EMPIRE.

**Kansas.** A central state of the United States, admitted Jan. 29, 1861; popularly known as the "Sunflower state." Total area, 82,276 sq.mi., of which 82,113 sq.mi. are land; pop. (1940) 1,801,028 (a decrease of 79,971 or 4.3% from 1930). Capital, Topeka (67,833). The two larger cities in 1940 were Kansas City (121,458) and Wichita (114,966). Of the state's population in 1940, 753,941 were urban, or 41.9%; 96.3% were white, 3.7% Negro and other races, 2.9% foreign born. The Kansas census as of March 1, 1945, reported the total population as 1,793,066, a loss of 10,842 from 1944. Wichita, with a 1945 population of 155,968 was the largest city; Kansas City was second with 134,212, and Topeka third with 76,590. Wichita lost 20,348 from the 1944 figure on account of levelling off of the aircraft industry.

**History.**—The state officers for 1945 were all Republicans: A. F. Schoeppel, governor; J. C. Denious, lieutenant governor; F. J. Ryan, secretary of state; George Robb, auditor; W. E. Wilson, treasurer; A. B. Mitchell, attorney general; L. W. Brooks, superintendent of public instruction.

The legislature of 1945 passed little major legislation except school measures, and in that field made a unique record. The most important measures were the Elementary School Reorganization act, the Uniform High School act, and the Reorganization of the Department of Education act.

**Education.**—Enrolment in the public elementary and secondary schools declined from 365,970 in 1940 to 351,370 in 1942-43. Of this number, 99,441 were enrolled in high schools and 251,929 in elementary schools. The number of teachers

dropped from 19,141 in 1930 to 18,944 in 1940. In 1942-43 there were 62,162 pupils enrolled in one-teacher rural schools, a decline of 7,173 from the 1939 figure. There were 8,575 organized school districts in 1942-43 and 6,748 districts operating. The reorganization required under the new legislation would change the whole setup within three years.

**Communication.**—At the end of 1941 the state had 9,368 mi. of primary rural highways; the steam railroad mileage was 8,567. There were 342,277 telephones in 1937.

**Banking and Finance.**—As of June 30, 1942, there were 640 active banks, 179 of which were national, with total demand deposits of \$583,500,000. Savings banks held \$82,500,000 of deposits. Kansas income tax collections for the year 1944 were \$6,635,576.52, an increase of more than 2% over 1943. The sales and compensating tax collections amounted to \$17,291,811, an increase of more than 9%. The state budget for the biennium 1945-47, as approved by the governor, amounted to \$23,013,155.

**Agriculture.**—The 1945 production of Kansas crops was 14% less than 1944, but was exceeded in only three preceding years—1931, 1942 and 1944. In value it was third only to 1919 and 1944. The 1945 wheat crop was second only to 1931, the average yield being 15.5 bu. compared with 17 bu. in 1944 and 12.8 bu. for the 10-year average, 1934-43. The 1945 corn yield was only about 63% of the 1944 crop, but compared favourably with the 10-year average of 45,090,000 bu.; 63% was hybrid varieties as compared with 47% in 1944.

Table I.—Leading Agricultural Products of Kansas, 1945 and 1944

Crop	1945	1944	Crop	1945	1944
Wheat, bu. . .	207,961,000	191,669,000	Barley, bu. . .	6,702,000	14,144,000
Corn, bu. . .	72,864,000	114,793,000	Soybeans, bu. .	2,740,000	3,315,000
Sorghum, bu. .	16,632,000	49,468,000	Potatoes, bu. .	1,476,000	1,092,000
Oats, bu. . .	17,668,000	27,738,000			

Fall planting of winter wheat for the 1946 crop was estimated at 14,145,000 ac., or the same as 1944, and constituted about 60% of all crops, and 27.2% of U.S. winter wheat acreage. Its condition Dec. 1, 1945, was 78% compared with 92% in 1944 and a 10-year average of 73%. The extreme western counties, the so-called "dust bowl," harvested their fifth successive big wheat crop, a record never before equalled. The preliminary figures for the 1945 federal agricultural census showed that Kansas lost 13,931 farms after 1940, but gained 463,567 ac. in farms. The spring movement of cattle from the southwest into the Bluestem pastures in 1945 was 15% larger than in 1944—320,000 compared with 279,000 in 1944, and a 10-year average of 223,000.

**Manufactures and Mineral Production.**—In 1944 Kansas oil production reached 99,853,000 bbl., a little below 1943, but natural gas output reached an all-time high of 134,000,000,000 cu.ft. There were 53 entirely new oil and gas pools discovered during the year. A report on proved coal reserves

Table II.—Principal Mineral Products of Kansas, 1944 and 1943

Mineral	Value, 1944	Value, 1943
Petroleum . . . . .	\$120,800,000	\$127,410,000
Coal . . . . .	9,350,000	8,606,968
Cement . . . . .	4,454,060	8,035,559
Zinc . . . . .	14,524,284	12,299,904
Lead . . . . .	1,503,040	1,381,950
Salt . . . . .	4,357,217	4,197,507

set the figures at 906,331,175 tons of mineable coal; at the existing rate of consumption, a supply for 243 years.

(J. C. MN.)

**Keitel, Wilhelm** (1882— ), German army officer, was born Sept. 22 at Gandersheim. An artillery commander during World War I, he was promoted to major general on April 1, 1934. The following year, when Germany introduced conscription, he took charge of the personnel

section (*wehrmachtsamt*) in the war ministry and was thus connected, to a certain extent, with the occupation of the Rhineland in 1936 and the dispatch of German troops to Franco Spain. In Feb. 1938, when Hitler purged the conservative members of the high command, Gen. Keitel was appointed supreme commander of the German armed forces. He thus directed operations (1939-40) against Poland, Norway, the Low Countries, France and the aerial blitzkrieg against England. On June 22, 1940, he signed the French-German armistice, and on July 19 he was made field marshal by Adolf Hitler. In Aug. 1944 Keitel visited Baron Carl Gustav von Mannerheim in Helsinki but failed in his efforts to dissuade the Finnish leader from concluding peace with the soviet union. Keitel was head of the German delegation that signed the Allied surrender terms in Berlin May 8, 1945, in the presence of high Allied dignitaries. He was later arrested and was one of the top-ranking nazi war criminals tried at the Nuernberg sessions. On Aug. 14 Keitel was quoted as saying that he was still a faithful follower of Hitler. He professed ignorance of the concentration camp atrocities.

## Kenney, George Churchill

(1889— ), U.S. army officer, was born Aug. 6

in Yarmouth, Nova Scotia, the son of U.S. citizens. He attended the Massachusetts Institute of Technology, Cambridge, Mass., for three years, but left in 1911 and later worked at civil engineering. In June 1917, he enlisted as a flying cadet in the U.S. signal corps reserve's aviation section. He saw active duty in France and was awarded the D.S.C. for extraordinary heroism in action. At the end of the war, he held the rank of captain. Kenney attended the Command and General Staff school, 1927, and the Army War college, 1933. In 1940, he irritated ranking U.S. military officials with the statement that the U.S. air force could be "thrown into the ash can" because it was too antiquated for the kind of war the Germans were planning. However, he was promoted to the rank of brigadier general, Jan. 1941, and became a major general, Feb. 1942 and a lieutenant general, Oct. 1942. Kenney was later transferred, Sept. 1942, to the Southwest Pacific. There, under Gen. Douglas MacArthur, he was placed in command of Allied air forces. Kenney was credited by the war department with the origin of the accurate and deadly skip bombing technique. On June 27, 1944, Kenney was named head of the newly created far eastern air force. His new command combined the 5th air force, which operated in Australia and New Guinea, with the 13th air force, which fought in the Solomon Islands, New Britain and New Ireland. He participated in the Philippines campaign (1944-45) and directed tactical air attacks on Japanese targets in the broad Pacific war theatre. He was named to the temporary rank of a full general, March 13, 1945, and was confirmed in this post on March 28. Allied headquarters in Manila stated Aug. 17 that Kenney's air forces had destroyed 11,900 planes and had sunk more than 1,700,000 tons of Japanese shipping in the long Pacific campaign. Kenney approved (Nov. 2) the proposed war department measure for a merger of the armed services only if the air arm were given equality with other services.

**Kentucky.** An east south central state of the United States, admitted to the union June 1, 1792, popularly known as the "Blue Grass state." Area 40,598 sq.mi. of which 489 sq.mi. constitute water. Population as of July 1, 1944, was 2,630,194 of which 2,443,252 were whites. Negroes constituted 209,721 or 7.5% and 15,631 were foreign-born. Capital, Frankfort (11,492); largest city, Louisville (319,077). Other cities: Covington (62,018); Lexington (49,304); Owensboro (30,245); Paducah (33,765); Ashland (29,537). The war drew from Ken-

tucky 317,925 men who were enlisted and inducted.

**History.**—Chief officers (elected 1943 for a term of four years) were Simeon S. Willis, governor; Kenneth H. Tuggle, lieut. governor; Eldon S. Dummitt, attorney-general; Irvin Ross, auditor; T. W. Vinson, treasurer; John Fred Williams, state superintendent of schools; and Elliott Robertson, commissioner of agriculture. In the election of Nov. 6, 1945, the Democrats carried the general assembly, winning by 71 to 29 over the Republicans in the house and 21 to 17 in the senate. In addition two constitutional amendments were adopted, the first continuing the absentee ballot system first adopted by the general assembly in 1942. The second amendment provided that all funds obtained for the benefit of public roads be devoted exclusively to that purpose. On Nov. 19 Governor Willis appointed William A. Stanfill U.S. senator to fill the vacancy caused by the resignation of Senator Albert B. Chandler.

**Education.**—Elementary schools in 1945 enrolled a total of 445,678 pupils, while the enrolment in high schools was 82,212.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—On June 30, 1945, those drawing old-age assistance were 48,190, a decline of 11% from the 54,159 at the first of the year. State funds available for this purpose exclusive of U.S. aid, were on June 30, 1945, \$4,537,536. The mortality rates remained unchanged despite a great shortage of medical personnel.

**Communication.**—Eight intrastate bridges were declared toll-free Aug. 25. On Oct. 10 Pres. Truman dedicated the Kentucky dam at Gilbertsville. The average road mileage maintained in the state during the fiscal year ending March 31, 1944, was 9,896.124 mi.

**Banking and Finance.**—Expenditures for the fiscal year ended June 30, 1945, in the general fund, amounting to a total of \$32,812,651.67, were as follows: education \$19,640,621.31; welfare \$7,389,911.53; judiciary \$1,407,664.67; general government \$1,412,683.87; new lands and buildings \$890,111.68; health \$773,245.83; Jefferson, Kenton and Harlan counties \$488,937.28; conservation, agriculture and regulations \$546,634.18; confederate pensions \$75,433; military \$137,691.42; legislative session \$49,716.90.

Revenue receipts for the same fiscal year, totalling \$36,741,092.37, were as follows: property and inheritance taxes \$6,929,656.72; income and special corporation taxes \$12,140,644.91; excise taxes, other than alcohol, \$5,526,143.29; alcohol taxes and licenses \$8,559,120.85; licenses and license taxes, other than alcohol, \$1,932,449.49; departmental fees, sales and rentals \$111,340.66; county and court costs \$1,093,046.35; miscellaneous revenue \$448,690.10.

**Agriculture.**—The principal crops of 1945 were as reported in the accompanying table.

Leading Agricultural Products of Kentucky, 1945 and 1944

Crop	1945	1944
Wheat, bu. . . . .	5,278,000	7,902,000
Corn, bu. . . . .	77,824,000	67,080,000
Oats, bu. . . . .	1,925,000	1,538,000
Tobacco (all types), lb. . . . .	469,395,000	398,195,000
Timothy hay, tons . . . . .	2,525,000	1,623,000
Irish potatoes, bu. . . . .	3,999,000	2,494,000

**Mineral Production.**—At the end of 1944 there were 72,406,927 tons of coal mined and 9,502,695 barrels of oil produced. The mining casualties were 157. (E. T.)

**Kenya:** see BRITISH EAST AFRICA.

**Kern, Jerome David** (1885–1945), U.S. composer, was born Jan. 27 in New York city. His mother taught him to play the piano and later sent him to Germany and England to study composition. He returned

to New York where he worked for various music publishers and later became vice-president of a music publishing firm. His first musical comedy produced in the U.S., *Mr. Wix of Wickham*, went scarcely noticed. In 1911, he wrote the music for *The Red Petticoat*, and in a three-year period, 1915–18, he wrote the scores for 19 productions. His name became a byword in show business, though Kern modestly disclaimed any credit as an artist. He described himself as a “musical clothier . . . I write music to both the situations and the lyrics in plays.” Critics, however, praised the finished musicianship, the complex vocal and instrumental ensembles and the elaborate counterpoint effects that marked his operettas. His best known work was *Show Boat*, 1927, with lyrics by Oscar Hammerstein II, based on the novel of Edna Ferber. One song from this show that the composer considered his masterpiece was “Ol’ Man River.” In 1931, Jerome Kern went to Hollywood, Calif., where other of his stage successes were filmed. He wrote additional scores for *Can’t Help Singing* and *Till the Clouds Roll By*, a musical biography which was put into production at the time of his death. Other of Kern’s musicals include *Sally*, *Roberta*, *Music in the Air*, *Cat and the Fiddle*, *Sweet Adeline*, *Sunny* and *The Girl from Utah*. Some of his best known songs were “Look for the Silver Lining,” “They Didn’t Believe Me,” “Smoke Gets in Your Eyes” and “The Last Time I Saw Paris.” Kern, who had gone to New York to sponsor a new production of his *Show Boat* with Hammerstein, died in that city, Nov. 11.

**Kesselring, Albert** (1887– ), German army officer, began his career as an aviator in World War I. His friendship with Reichsmarshal Hermann Goering aided his rise, and in 1936 he was appointed first chief of the luftwaffe’s general staff, but later resigned because his technique of air operations met with disapproval. The shakeup in the German high command in Feb. 1939 brought Kesselring back to favour, and he directed phases of air operations in the Polish campaign (1939) and in operations against the Netherlands, Belgium and France in May 1940. Kesselring was then promoted by Hitler to the rank of general field marshal. He commanded a German aviation unit on the Russian front, 1941–42, and served as chief of the luftwaffe in Italy, Feb. 1942. In Sept. 1943 Kesselring was placed in command of the central Italian front, and he assumed over-all command of the wehrmacht in Italy after Rommel’s departure for the western front. It was stated March 22, 1945, that Kesselring had replaced Field Marshal von Rundstedt as commander of German forces on the western front. Kesselring, however, had no chance to display the skill he had proved in Italy, as the German armies were by then too far disrupted and shattered. Field dispatches of May 9 said that Kesselring was captured by troops of the U.S. 7th army. He was subsequently imprisoned at the Palace hotel in Luxembourg together with high ranking nazi officials who were awaiting trial as war criminals.

**Keyes**, 1ST BARON, OF ZEEBRUGGE AND DOVER (1872–1945), British admiral, was born Oct. 4 and joined the navy in 1885. For earlier career, see *Encyclopædia Britannica*. He was in command of the Dover patrol during World War I and led the attack on Zeebrugge that closed the Bruges canal. He was made an admiral of the fleet in 1930 and was a member of parliament, 1934–43. In 1943 he was made a baron. As director of combined operations (1940–41), he was in charge of developing the famed British commandos. His son, Lt. Col. Geoffrey C. T. Keyes, was killed while leading a commando raid on Gen. Rommel’s headquarters in 1941 and was posthumously awarded the Victoria cross. Lord Keyes was the author

of a number of works including his *Naval Memoirs* in two volumes—vol. I, *The Narrow Seas to the Dardanelles* (1934) and vol. II, *Scapa Flow to the Dover Straits* (1935). Among his other works are: *Adventures Ashore and Afloat* (1939), *The Fight for Gallipoli* (1941) and *Amphibious Warfare and Combined Operations* (1943). Lord Keyes died at his home in Buckingham, Dec. 26.

**Kidnapping.** Wartime influences continued to affect the number and character of kidnappings during 1945, and as a result there was not only a marked reduction in such crimes, but there seemingly were no kidnappings for ransom.

The more striking cases all occurred in the United States and were notably small in number. Most unusual case arose in Jan. 1945 on the Arizona-New Mexico border where an outbreak of Navajo Indians, caused by resistance to the livestock reduction program, was accompanied by three kidnappings. A more familiar pattern was followed in Chicago, where a watchman was kidnapped and forced to aid in opening the vaults of the Rumbold Real Estate company. Still another motivation for this type of crime was involved in the taking from a hospital nursery of week-old J. E. Creviston. Mrs. P. Lanman was held.

The amazing performance of the Federal Bureau of Investigation doubtless had a considerable influence in reducing the number of kidnappings in the United States. During the 10½ years preceding Dec. 31, 1944, there were 273 cases of kidnapping and conspiracy to kidnap in the U.S. which came within the jurisdiction of the FBI. Of this total, only two cases, which continued under active investigation in 1945, were unsolved. Both 10-year-old Fletcher Mattson, kidnapped at Tacoma, Wash., on Dec. 27, 1936, and 12-year-old Peter D. Levine, taken at New Rochelle, N.Y., on Feb. 24, 1938, were later found dead, and the persons responsible were still being sought.

The grand total of 271 kidnappings resulted in 553 convictions, plus 8 kidnappers who were killed while resisting arrest, 2 who were lynched, 7 who were murdered by gangsters and 1 who was declared insane.

Kidnapping convictions during 1944 totalled 27 in number.

Most interesting prosecution for kidnapping during 1945 was in connection with the long-continued Stoll case, in which T. H. Robinson, Jr., convicted of the crime under federal statute, was denied executive clemency by newly inaugurated President Truman, and was transferred to Louisville, Ky., under sentence of death. During the following month, however (June 1945), President Truman commuted the sentence, and charges were made of "political influence" exercised by Senator A. B. Chandler. At this point the U.S. department of justice announced that Attorney General Biddle had recommended commutation because of the severity of the death penalty. At a hearing to determine Robinson's mental responsibility he was found to be sane. (See also FEDERAL BUREAU OF INVESTIGATION.) (Br. S.)

**King, Ernest Joseph** (1878— ), U.S. naval officer, was born Nov. 23 in Lorain, O. He left Annapolis to serve in the Spanish-American War, returning to the naval academy to graduate in 1901. During World War I he was assistant to the chief of staff of the commander in chief of the U.S. fleet. He was promoted to rear admiral in 1933 and to vice-admiral in 1938, in command of the fleet's aircraft battle force. On Feb. 1, 1941, he was made commander of the Atlantic fleet and on Dec. 20, 1941, he was made commander in chief of the U.S. fleet.

Adm. King assumed the additional post of chief of naval operations on March 9, 1942.

In 1943 and 1944, Adm. King participated in several military

and naval conferences dealing with British-U.S. war strategy. His planning was credited with the destruction of Japan's naval power in 1944 and 1945. On Dec. 14, 1944, he was promoted to the newly-created rank of fleet admiral, along with Chester W. Nimitz and William D. Leahy.

Definitely a "big navy man" the admiral asserted April 4, 1945, that the U.S. must maintain a large postwar navy and keep its new Pacific bases as a safeguard against future aggression. He also favoured universal peacetime military training. In the navy report on Pearl Harbor, issued Aug. 29, Adm. King obliquely criticized Adm. Husband E. Kimmel for failing to assess correctly the danger of a possible Japanese attack. On Nov. 20 Adm. King relinquished his post as chief of naval operations and was succeeded by Adm. Nimitz. In his final annual report, Dec. 8, King contended that Japan's defeat was "directly due to our overwhelming power at sea" and asserted that the proposed army-navy merger would destroy the navy's effectiveness.

**King, William Lyon Mackenzie** (1874— ), Canadian politician, was born at Berlin (now Kitchener), Ont., Dec. 17. His grandfather, William Lyon Mackenzie, had been prominent in the struggle for political freedom in 1837. King entered parliament in 1908, became leader of the Federal Liberal party in 1919, and was returned to office as prime minister for the third time on Oct. 23, 1935. Following Canada's entry into World War II, the King government came under attack of his political foes, and there were recurrent charges of incompetence in handling the war effort. However, the country stood firmly behind the prime minister. The growing controversy over the question of conscription for overseas duty reached a crisis in 1944. King's proposal on Nov. 23 to send overseas 16,000 of the 42,000 "home service" draftees, under authority of the National Resources Mobilization act, precipitated a storm of protest, particularly in the French-speaking province of Quebec. However, after several weeks of violent debate, the house on Dec. 8 voted 143 to 70 to "aid the government in maintaining a vigorous war effort." King co-operated with the United States in measures for common defense of the two countries, and he participated in several Churchill-Roosevelt conferences. In the general elections held June 11, 1945, King's Liberal party emerged victorious although it failed by a slim margin to obtain a clear majority. King himself was defeated in his constituency in Prince Albert, Sask., but was re-elected in a parliamentary by-election in Ontario, Aug. 6. He participated with Truman and Atelee in the Washington conference on atomic energy, Nov. 15.

**Kingman Island:** see PACIFIC ISLANDS, U.S.

**Kinkaid, Thomas Cassin** (1888— ), U.S. naval officer, was born April 3 at Hanover, N.H., and was graduated from the U.S. naval academy at Annapolis, Md., in 1911. After serving with the British admiralty in World War I, he became gunnery officer of the U.S.S. "Arizona" in the late months of the war. He played an important part in 1942 in both the battle of the Coral sea and the battle of the Solomon Islands. The following year he was named commander of the naval force in the North Pacific, with direction of joint military operations in that area. In this capacity, Kinkaid engineered the unopposed landing of U.S. forces on Kiska Island in Aug. 1943. He was promoted to the rank of vice-admiral in June 1943 and, in November of the same year, he became commander of the 7th fleet. In April and May of 1944, he supported Allied landings at Biak Island and at Hollandia in New Guinea. In the battle for Leyte gulf, in

October, his fleet delivered a crushing blow to the Japanese navy, knocking out two of its forces converging on the gulf. The 7th fleet covered U.S. ground forces invading Luzon (Jan. 9, 1945) and then roamed deep into enemy waters, persistently battering Japanese shore installations while its carrier aircraft bombed numerous targets. On March 29, Kinkaid was promoted to the rank of a full admiral. The navy department disclosed, Nov. 14, that Adm. Kinkaid was to be succeeded as commander of the 7th fleet by Vice-Adm. Daniel E. Barbey.

**Kiwanis International:** *see* SOCIETIES AND ASSOCIATIONS.  
**Knights of Columbus:** *see* SOCIETIES AND ASSOCIATIONS.

**Koenigsberg.** A city formerly the capital of the German province of East Prussia. Population (1939) 368,433. Koenigsberg is an important port, the protected position of which makes it equally favourable for military and commercial purposes. The university founded in 1544 and where Immanuel Kant taught had, in 1936, 225 teachers and 1,219 students. The Russians bombed and occupied the city in World War II. Though the population of the city and the surrounding district was purely German, it was decided at the Berlin conference by the Big Three in 1945 to incorporate the city and the district into the U.S.S.R. The Polish claims to the northern part of East Prussia and the capital were disregarded. The district became a part of the Russian Socialist Federal Soviet republic from the territory of which it is separated by the Lithuanian Socialist Soviet republic. It was organized as a special *okrug* (circle or district) which contained the important cities of Koenigsberg, Tilsit and Insterburg. (H. Ko.)

**Koiso, Kuniaki** (1880— ), Japanese army officer and statesman, was educated at the Military Staff college where he later served as instructor. In 1932 he served as vice-minister for war and as a member of the staff of the Kwantung army in Manchoukuo. He was minister for overseas affairs, 1939-40, in the Hiranuma cabinet, and became governor general of Chosen in May 1942. In July 1944 he was named premier of Japan, succeeding Gen. Hideki Tojo. Koiso was known as a staunch disciple of Japan's "special mission" in east Asia, namely, aggression and expansion. In October of 1944 he told the Japanese people bluntly that they had been on the defensive since Guadalcanal. He held out hope, however, that Japan could defeat the Allies once the fighting entered Japan's "inner sphere." This hope was dissipated in 1945 by the successful U.S. invasion of Iwo Island and the gradual reduction of the Japanese holdings in the Philippines and Burma. On March 21, Koiso asked for sweeping emergency powers to prepare for an eventual Allied invasion. But on April 5, a Tokyo broadcast disclosed that his cabinet had been ousted to prepare for a more "powerful" regime. His arrest was ordered by Gen. MacArthur on Nov. 19, and he surrendered to Allied occupation forces Nov. 23.

**Konev, Ivan Stepanovich** (1897-? ), Russian army officer, came of peasant stock and was in the Red army virtually from its establishment. At 20, with his wife, he organized guerrillas in the far east and fought against the Kolchak (White Russian) army and subsequently commanded an armoured train against the Japanese. Konev participated in the attack that subdued the Kronstadt rebellion; then, after civil war began, he continued his military training at Frunze academy. He was soviet commander in the west when Germany attacked Russia in 1941, and led the first real counterattack of the war. He was withdrawn to form what became the northwest front army which went into action with

the opening of the Moscow counteroffensive in Dec. 1941. In the critical summer of 1942 he led a six-week operation against Rzhev which tied down a large force that might otherwise have been sent to assist the 6th German army pounding at Stalingrad. Konev was one of the generals under whose direction the Russian armies in 1943 broke Germany's third summer offensive. In Aug. 1944 his army crossed the Vistula river, south of Warsaw, breaking through the last German stronghold before Germany proper. He was awarded the Order of Suvorov in 1943 and in March 1944, he was promoted to marshal of the soviet union. Konev's 1st Ukrainian army was in the forefront of the great Russian drive launched from Poland in mid-January 1945. His army crossed the Vistula river, plunged into Silesia, forced the Oder and together with Marshal Zhukov's forces entered and captured Berlin. After Germany's surrender, Konev was made commander of Russian occupation forces in Austria.

**Konoye, Fumimaro** (1891-1945), Japanese prince and statesman, was born at Kyoto in October, the son of Prince Atsumaro Konoye and descendant of one of Japan's oldest families. He was graduated from Tokyo Imperial university's law college in 1917, and was a member of Prince Saionji's delegation to the Paris peace conference the following year. After serving in the house of peers, he was prime minister, 1937-39, and sanctioned the war on China. He subsequently became minister of state without portfolio and president of the privy council. In July 1940, after the resignation of Adm. Yonai, he again became prime minister. He then organized the Imperial Rule Assistance association and also headed the Great Japan and Asia Development league, whose major goals were conquest of Asia and maintenance of close bonds with the axis. From all appearances, Konoye's ministry was dedicated to "moderation" in foreign affairs. Konoye resigned, July 16, 1941, and formed a new cabinet two days later without his foreign minister, Yosuke Matsuoka. Konoye's new government lasted only three months, and the prince was succeeded in October by sabre-rattling Gen. Hideki Tojo, who was pledged without reservation to fulfilment of Japanese aspirations in east Asia. Konoye's arrest to stand trial as a war criminal was ordered by Gen. MacArthur, Dec. 6, 1945. On the night that he was to give himself up, Dec. 16, Konoye took his life with poison. His son later disclosed political memoranda compiled by Konoye before his death, in which the prince put the burden of the blame for Japan's decision to attack the United States on Tojo and Matsuoka.

**Korea** (CHOSŌN). A part of the Japanese empire from 1910 until the Japanese surrender in 1945, then a theoretically independent state under U.S. and Russian military control, Korea is a peninsula extending southward from the northeastern side of the continent of Asia. It is bounded E. by the Sea of Japan, W. by the Yellow sea and N. by Manchuria and the maritime province of Siberia. Area: 85,225 sq.mi., including 1,018 adjacent islands; pop. (Oct. 1, 1940) 24,326,327. There were 650,100 Japanese in Korea in 1939 and 49,815 non-Japanese foreigners, mostly Chinese, in the country in 1938. The capital is Seoul (Keijo), pop. (1940 census) 935,464. Other large cities: Pyeng-yang (Heijo) (285,965); Fusan (249,734); Seishin (197,918); Taikyu (178,923). Buddhism, Confucianism and Taoism are prevalent forms of religion. There were 494,500 Koreans and 5,800 Japanese Christians in Korea in 1938. The last Japanese governor general, General Nobuyuki Abe, was removed from office after the surrender of Japan in 1945. The head of the Korean provisional government at the end of 1945 was Kim Koo.

FORMAL OCCUPATION of Korea, led by the U.S. 7th infantry division, began early in Sept. 1945. Koreans lined the street to welcome these veterans of bitter fighting in the Southwest Pacific

**History.**—Korea was not directly drawn into World War II until Aug. 1945, when Russian forces overran the northern part of the country. A U.S. occupation force under Brigadier General John R. Hodge took over the southern part and a line of demarcation along the 38th parallel of latitude was established. The section under soviet control was more industrialized, the region under U.S. occupation more agricultural. There had been little experience in self-government under the Japanese rule, and dispatches from Korea reported a multiplicity of parties and a good deal of political and economic confusion. A provisional government was organized under the leadership of Kim Koo, Korean nationalist who had headed a government in exile in Chungking. Information from the soviet zone was almost nonexistent.

Korea figured in the agreement announced after the conference of U.S. Secretary of State Byrnes, soviet Foreign Commissar Molotov and British Foreign Secretary Bevin in Moscow in Dec. 1945. It was agreed that Korea should be placed under a trusteeship of the United States, the soviet union, Great Britain and China for a period not to exceed five years and that representatives of the U.S. and soviet commands should meet within two weeks to discuss administrative and economic matters. There was a good deal of criticism of this arrangement from Korean leaders, who expressed the fear that it would postpone and perhaps imperil independence.

**Education.**—There were 3,372 elementary schools, with 1,311,270 pupils in Korea in 1938. There were 53 high schools, with 27,867 students; 57 girls' high schools, with 22,277 students; 226 technical schools, with 34,060 students; 10 normal schools, with 5,565 students; 18 special colleges (for medicine, dentistry, etc.), with 4,015 students. There were 350 Japanese and 206 Korean students in the single university in Seoul. There were 9,086 Korean students in Japan. Two trends in the Japanese educational system in Korea were to make Japanese the language of instruction and to emphasize vocational rather than cultural training.

**Finance.**—The unit of currency was the Japanese yen (23.48 U.S. cents before World War II). The Korean budget for 1942-43 was balanced at 1,012,577,000 yen. The national debt, as of 1941, was 593,646,215 yen and the amount of currency in circulation was 437,669,000 yen. There was no detailed information about financial arrangements under the new regime in 1945.

**Trade and Communication.**—Korea's imports in 1939 were 1,388,448,284 yen; exports were 1,006,793,785. There were 17,011 mi. of roads in 1939 and 2,619 mi. of government

and 1,107 mi. of privately owned railways in 1940. Korea possessed 738 steamships with a tonnage of 106,712 and 1,125 sailing vessels with a tonnage of 45,431 in Dec. 1939. The length of telegraph and telephone lines in 1941 was respectively 5,406 mi. and 6,780 mi.

**Agriculture, Manufacturing, Mineral Production.**—Korea is predominantly agricultural, although industrial development was speeded up in the last years of Japanese rule. A big hydro-electric power plant was built on the Yalu river. The principal crop is rice, with a production of 106,775,869 bu. in 1940. There were 1,705,000 cattle, 1,400,000 pigs, 51,000 horses and 20,000 sheep in Korea in 1939. Other important crops were barley, millet, rye, soybeans and apples.

There were 6,298 industrial establishments with five or more workers and a total of 166,700 employees in 1937. The value of industrial output in 1938 was 1,140,118,000 yen compared with 273,649,000 yen in 1931. The most important industries, in the order named, were chemicals, foodstuffs, textiles and metals. Gold, iron, coal, wolfram and mica are among the mineral resources of the country.

(W. H. CH.)

**Krueger, Walter** (1881— ), U.S. army officer, was born in Flatow, Germany, Jan. 26. Brought to the U.S. as a child, he attended the Cincinnati Technical school from 1896 to 1898 and left school to enlist as a private at the outbreak of the Spanish-American War. He later saw action during the Philippine insurrection, on the Mexican border, and during World War I. From 1921 to 1938 he filled various posts at army schools and on the general staff. Promoted through the grades, he became a brigadier general in 1936, major general in 1939, and lieutenant general in 1941. When the 6th army in the Southwest Pacific was organized early in 1943 during World War II, Gen. Krueger was sent to Australia to take command. In December the 6th army invaded the island of New Britain. When U.S. troops invaded Hollandia, Netherlands New Guinea, on April 24, 1944, Gen. Krueger supervised the landings. He also led the U.S. ground forces which took part in the invasion of Leyte Island in the Philippines on Oct. 20, 1944, and in the Luzon invasion (Jan. 9, 1945). Krueger was named to the temporary rank of a full general, March 13.

**Kure (Ocean) Island:** see PACIFIC ISLANDS, U.S.

**Kuwait:** see ARABIA.

**Kyanite Minerals.** Closely associated with kyanite are andalusite, dumortierite and sillimanite. Kyanite production in the United States was not reported in 1944, but was 9,561 short tons in 1943. It is used in refractories

and certain types of glass, supplies for the latter having been short. Imports from India usually run about the same as domestic output. Production of andalusite in Mono county, Calif., and of dumortierite in Pershing county, Nev., were not reported, but declined somewhat below the 1943 level. No sillimanite production was made, so far as was known in 1945, but 346 tons were imported in 1944. (G. A. Ro.)

**Labor, U.S. Department of:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**Labor Relations Board, National:** see NATIONAL LABOR RELATIONS BOARD.

**Labour:** see AGRICULTURE; AMERICAN FEDERATION OF LABOR; CHILD WELFARE; CONGRESS OF INDUSTRIAL ORGANIZATIONS; EMPLOYMENT; INTERNATIONAL LABOUR ORGANIZATION; LABOUR UNIONS; LAW; MOTION PICTURES; NATIONAL LABOR RELATIONS BOARD; NATIONAL MEDIATION BOARD; NEGROES (AMERICAN); RADIO; RELIEF; SHIPBUILDING; STRIKES AND LOCK-OUTS; SUPREME COURT OF THE UNITED STATES; UNITED STATES; WAGES AND HOURS; WAR LABOR BOARD, NATIONAL; WAR PRODUCTION, U.S. See also under various states.

**Labour Party.** In the general election of 1945 the British Labour party won a sweeping victory, raising its representation in the house of commons to 393 (out of 640) as compared with 154 (out of 615) in the election of 1935. In the election itself the party gained 202 seats, and lost only 3. Its gains were most remarkable in Greater London, Birmingham, and other big towns, and were partly due to a great swing-over to its side among the "blackcoated workers" in the residential areas, as well as to the support of the majority of service voters. The Labour party fought the election on a program entitled *Let Us Face the Future*, which included public ownership of the Bank of England, the mines, inland transport, power supply, and steel manufacture, a continuance of essential controls, an active housing and town-and-country planning policy, and a large scheme of social insurance based mainly on the Beveridge report. In general terms the program may be described as one of moderate socialism, with the fullest support for measures of international co-operation

LABOURITE stumping at a pre-election meeting in Great Britain during the campaign of 1945. Final tallies gave the Labour party a clear majority in the house of commons, with 393 seats out of a total of 640

for the economic rebuilding of war-devastated areas, as well as for the prevention of war. In May 1945 the Labour members had withdrawn from the Churchill coalition government after Winston Churchill had rejected an offer from them to remain until the autumn, in order to enable the election to be fought on an improved register, and after the Labour party conference had rejected Mr. Churchill's proposal that coalition should continue until the end of the war against Japan, which was then expected to last for some time. In August, after the election, the Labour leader, Clement R. Attlee, became prime minister, with Ernest Bevin as foreign secretary, Hugh Dalton as chancellor of the exchequer, Sir Stafford Cripps at the board of trade, and Herbert Morrison as lord president of the council. The new Labour M.P.'s included a high proportion of young service men, and there was a much smaller proportion directly representing the trade union element in the party. Of course many of these were members of trade unions, though not sponsored as candidates by their unions. Locally there was during the year a large-scale revival of Labour party activity, and after the general election active preparations were made for fighting the municipal elections—the first after their suspension during World War II—which were held in November. Large Labour gains were achieved on many of the local councils, and the Labour party captured a majority in a large number of towns, including several of the largest. It also further strengthened its position in the London boroughs, of which it now held 22 out of a total of 28. Elections for the London county council, on which Labour held a majority, were not due until the spring.

The most urgent issues facing the Labour government were those connected with demobilization, housing, and the proposed national health service, which involved a controversy with the British Medical association. Aneurin Bevan, the new minister of health, who was regarded as belonging to the extreme left of the party, was dealing with the two latter issues, while demobilization was mainly in the hands of George Isaacs, the minister of labour, who up to his appointment was chairman of the Trades Union congress. By November the government had introduced a bill continuing for five years the power to maintain necessary economic controls. Proposals had been brought forward for the nationalization of civil aviation and of wireless telegraphy services in addition to the industries scheduled for public ownership during the general election. In a number of industries, which it was not designed to nationalize, at any rate immediately, the government set up "working parties" representing the various interests concerned, under impartial chairmen, to report as speedily as possible on the future organization of each industry concerned, and this technique was expected to be extended to further industries. (See also CABINET MEMBERS; GREAT BRITAIN.) (G. D. H. C.)

**Labour Unions.** United States.—The problems arising out of the ending of the war and the re-conversion of industry from war to peace production dominated the activities and policies of organized labour in 1945. The first of these problems was wages. In anticipation of a considerable drop in employment and, hence, in hours of work after the war, all labour unions were prepared to demand prompt and large increases in wages to compensate their members for the decline in their weekly pay. The figure arrived at by the unions was 30%. An increase in this amount would, it was estimated, yield enough to make up the loss of 8 hours of overtime. Hence, when hours in war industries were reduced from 48 to 40, a 30% increase would, according to the unions, maintain the average employee's take-home pay.

Union demands for increases of 30%, or thereabouts, precipitated a great controversy over wage principles and policies.

which was still unsettled at the end of the year. Labour argued that industry was able to pay this amount out of profits, past and future, and out of the increasing efficiency of industry. It was the view of some union leaders that such increases could be paid without raising prices or diminishing profits. The employers argued that lifting wages by any such amounts would raise costs and prices and start the inflation which everyone wished to prevent. They saw also in these union demands efforts by organized labour to assume the responsibilities of management by asserting its right to determine a company's profits and the method of distributing its earnings.

Although some wage demands were settled, the most important were deadlocked and in the fall strikes broke out among the employees of General Motors and other industries. The spread of strikes and the threat of additional ones in steel, meat packing and telephones raised the whole question of public policy toward wages and strikes.

On the matter of wages organized labour seemed to have the support of the president. He favoured substantial advances in wages and believed they could be granted without affecting prices. But as to the means of preventing strikes the president and the unions found themselves far apart. Their differences arose over his proposal to set up fact-finding boards charged with examining the facts and reporting their recommendations. The president's plan provided a cooling-off period of 30 days, during which strikes were forbidden, and empowered the board to subpoena relevant records. The unions—the C.I.O., A.F. of L. and Mine Workers—reacted violently against the whole program, seeing in it compulsory arbitration and restrictions on the right to strike. By the close of the year, congress had failed to act on the president's recommendations. But in order to deal with existing and impending strikes, the president set up by executive order fact-finding boards to handle the auto, steel, oil and meat-packing disputes and these proceeded to act without statutory authority.

Among the devices conceived by the administration for developing labour and strike policies was the labour-management conference. This conference, composed of leaders of industry and labour, met in Washington to consider the means of promoting labour peace. Early in its deliberations, the conference split on the issue of wages, Philip Murray of the C.I.O. contending that the conference should formulate a wage policy and the A.F. of L., miners and employers contending that wages must be settled by individual employers and unions. Though conducted with good will, the conference failed to reach important conclusions.

Because of the liquidation of war industries, such as ship-building and aeroplane manufacturing, the unions lost many members in 1945. But how many they lost was not known at the close of the year. They remained strong in civilian industry and throughout the year they carried on extensive organizing campaigns in nonunion plants, and particularly among white-collar workers.

The feud between the A.F. of L. and the C.I.O. remained unsettled. The C.I.O. reinforced its international position and enhanced its prestige by taking a prominent place in the activities of the new world congress of unions. Abandoned by the British Trades Union congress, the A.F. of L. continued its opposition to any international organization of labour which admitted to membership the Russian unions or any unions controlled by government and, for the moment, stood alone against a strong trend toward international labour organization. In the United States the C.I.O. won further and valuable recognition by the appointment of one of its officers as an assistant secretary of labour. (See also AMERICAN FEDERATION OF LABOR; BUSINESS REVIEW; CONGRESS OF INDUSTRIAL ORGANIZATIONS; LAW; NA-

TIONAL LABOR RELATIONS BOARD; STRIKES AND LOCK-OUTS.)  
(L. Wo.)

**Great Britain.**—Membership of the British Trades Union congress fell, because of call-ups for the services, from 6,642,000 in 1944 to 6,576,000 in 1945. There were 191 affiliated trade unions, but practically 80% of the total membership belonged to only 22 unions, each with more than 50,000 members. By far the largest single union was the Transport and General Workers' union (1,017,000) of which Ernest Bevin ceased to be secretary. Next in order came the Amalgamated Engineering union (811,000); the National Union of General and Municipal Workers (661,000) and the National Union of Mineworkers, now consolidated into a single union in place of the former federation (605,000). Two other societies, the National Union of Railwaymen (404,000) and the National Union of Distributive and Allied Workers (272,000) had more than 250,000 members; and four more—the Amalgamated Society of Woodworkers (170,000), the Electrical Trades union (132,000), the National Union of Tailors and Garment Workers (109,000) and the National Union of Agricultural Workers (104,000)—exceeded 100,000. There were 12 additional unions with more than 50,000 members. Of the total membership 1,341,000, or 20%, were women. The unions with the largest female membership were the Transport and General Workers' (215,000), General and Municipal Workers' (194,000), Amalgamated Engineering (132,000), Distributive and Allied Workers' (113,000). The sharp rise in female membership of the A.E.U. was particularly notable.

The chief groups still outside the Trades Union congress were the civil servants, including the post-office workers, the local government officers and the teachers. Of these, the main civil service unions would presumably rejoin as soon as the new Labour government carried out its declared intention of repealing the Trade Unions and Trade Disputes act of 1927, by which they were forbidden to associate with unions outside the civil service. Total trade union membership in Great Britain in 1945 was probably about 8,000,000.

The annual Trades Union congress was again held in Blackpool in September. The agenda and a number of special reports from the policy committees of the general council had been prepared before the general election, but were not held to need much alteration. In particular, the special reports on fiscal policy and on the public operation of transport, as well as the long section in the general council's report dealing with the regulation of trusts and cartels, went through practically unchallenged. On fiscal policy the congress pressed for a restoration of income tax allowances for dependents to the levels existing before war taxation was stiffened, for the speedy introduction of children's allowances for all families, and for some reduction in the heavy burden of indirect taxation on necessary commodities. It was agreed that there would have to be some reduction of the excess profits tax, but the reforms mentioned were deemed more urgent than a reduction in the standard rate of income tax. On trusts and cartels the general council urged the control and supervision of all restrictive combinations, including control of international trusts and cartels by a special organ of the United Nations organization. It refused to take a line of direct hostility to such bodies, on the ground that while dangerous in capitalist hands, they might be necessary steps toward orderly planning of national and international economic affairs. The report on transport, prepared in conjunction with the Labour party, embodied a draft scheme for the public ownership and operation of the main transport services. A similar report had been prepared on coal mining, but was not published in view of the expected early production of the government's bill for the socialization of the industry.

The two most urgent topical issues discussed at the 1945 con-

FIRST CONGRESS of the World Federation of Trade Unions closed in Paris on Oct. 8, 1945. Delegates of 56 nations representing an estimated 66,759,348 workers passed resolutions favouring labour representation at world peace councils and democratic rights for workers

gress were demobilization and the control of labour. On demobilization, there was a general demand for a great speeding-up of the plans prepared under the Churchill government, and for insistence by the Labour government on the service departments scaling down their demands. On labour controls it was agreed that abolition was desirable as soon as possible, but impracticable immediately in view of the acute shortage of workers and the need to ensure priority for essential industries. It was, however, urged that punitive sanctions should be given up at once and only milder measures of control retained during the transition.

The congress approved the plans made for forming a new world federation of trade unions. The fraternal delegate from the American Federation of Labor (George Meany) delivered a vigorous attack on this policy in the course of his address, which by custom was not subject to debate. He objected both to the association of the trade unions of the soviet union with the new federation and to the participation of the Congress of Industrial Organizations. The soviet fraternal delegate protested against Mr. Meany's speech, but was not allowed to reply. There was, however, no doubt of the congress' overwhelming support for the world federation, despite the attitude of the A.F. of L., which was endorsed by the fraternal delegate from the Trades and Labor Congress of Canada, representing mainly Canadian sections of A.F. of L. unions.

The British trade union movement was in September passing through the first stages of reconversion from war to peace. It was anxious not to embarrass the new government, on which it relied to carry out the policy formulated for the most part in agreement between the Trades Union congress and the Labour party. It stood strongly for the maintenance of price stability, for a policy of full employment based on national planning, and for gradual extension of socialization to key industries and public regulation of the main nonsocialized industries through

industrial boards representing workers, employers and the state. It had declared no general wage policy, but recognized an obligation not to take undue advantage of full employment for pressing wage claims. Its chief immediate demand was for the general enforcement of a maximum working week of 40 hours, without wage reductions, but the government gave no indication of its attitude on this issue.

**Labrador:** see NEWFOUNDLAND AND LABRADOR.

**Lacrosse.** The highlight of the 1945 lacrosse season in the United States was the tie for the Wingate trophy between the teams of Army and Navy. The trophy is presented annually to the leading college team in the U.S. The annual William Schmeisser Memorial trophy went to Charles Guy of the Naval academy for being the outstanding defense player.

The United States Intercollegiate Lacrosse association, governing body of the sport in the United States, changed presidents with Carl P. Schott of Penn State replacing John H. Paige of Colgate.

Nick Thiel of Penn State was voted "the man who did most for lacrosse in 1945" by the executive committee of the U.S.I.C.L.A. Although his team won only one game his efforts on behalf of the sport won the acclaim of his fellow coaches.

In Canada, box lacrosse made a strong comeback with the return to action of the New Westminster Adanacs, the team that won the Mann cup in 1939 but had been out of play because of the war.

The Mann cup for 1945, emblematic of Canada's lacrosse supremacy, was won by the Vancouver Burrads who defeated the St. Catherine's Athletics.

**Lalique, René** (1860-1945), French designer of jewellery and glassware, was born April 6, in Ay, Marne. He displayed remarkable talent at designing in school, and by the time he was 30 he was widely renowned among

Parisian jewellers for his skill and originality. Lalique displayed his jewellery at the Paris International exposition in 1900. His numerous examples of brooches, necklaces, combs and other decorative adornments were marked by the employment of novel and richly-coloured materials and were among the sensations of the exposition. Lalique used modern mechanical methods in his work in glassware and he became one of the world's leading craftsmen in the design of decorative glassware. He used human figures as well as animals and flowers in his ornamental glass vases, with subtle and pleasing effect. Lalique also executed large decorative works, such as the fountain in the Esplanade des Invalides during the exposition of 1925 and a fountain-ornamented mural for the ocean liner "Paris." In 1933, Lalique was invited to exhibit his work at the Pavillon de Marsan of the Louvre; he also showed his works in New York on several occasions. He died at his home in Paris, May 9.

**Lamb:** see MEAT.

**Land, Emory S.** (1879- ) U.S. naval officer and government official, was born Jan. 9 in Canon City, Colo. He was graduated from the University of Wyoming, Laramie, Wyo., 1898; Annapolis, 1902; and the Massachusetts Institute of Technology, Cambridge, Mass., 1907. During World War I, he served on the staff of Adm. William Sims in London. Made a rear admiral when he retired from the navy in 1937, he was named commissioner of the U.S. maritime commission in 1937, and succeeded Joseph Kennedy as chairman in 1938. Soon after the U.S. entered World War II, Adm. Land was also made administrator of the War Shipping administration. In Sept. 1944 he reported that the U.S. merchant marine had grown from 1,340 ships totalling 11,850,000 deadweight tons at the start of the war, to a strength of 3,400 ships aggregating more than 35,000,000 deadweight tons. Adm. Land attended the Berlin conference (July-Aug. 1945). On Sept. 8, he declared that a U.S. merchant fleet aggregating 17,000,000 tons was an essential to both U.S. military security and trade prosperity. On Jan. 4, 1946, Pres. Truman accepted Land's resignation from both his government posts, effective Jan. 15.

**Lang, Cosmo Gordon,** 1ST BARON, OF LAMBETH (1864-1945), Anglican divine, was born Oct. 31 in Aberdeen, Scotland. For his earlier career, see *Encyclopædia Britannica*. He became archbishop of Canterbury, Nov. 12, 1928, and retired in March 1942. Upon his resignation, Archbishop Lang became 1st Baron Lang of Lambeth and sat in the house of lords as a temporal peer. During his tenure as archbishop, Lord Lang opposed the plans of King Edward VIII (later known as the Duke of Windsor) to marry Mrs. Wallis Warfield Simpson, and asserted that Edward had "disappointed hopes so high, abandoned a trust so great and sought his happiness in a manner inconsistent with Christian principles." In the years immediately preceding and during World War II, he emerged as a bitter foe of the Nazi racist philosophy. He condemned the Munich agreement, attacked the German persecution of the Jews and had harsh words for Italian and Japanese aggressions in Ethiopia and China respectively. Although he never wavered in his denunciations of Russia's atheism, he expressed admiration for the Red army's stubborn fight against the Germans and called upon his people to pray for the Russians. Lord Lang collapsed while hurrying for a train and died while being taken to the Royal hospital at Richmond, Dec. 5.

**Laos:** see FRENCH COLONIAL EMPIRE.

**Lard.** The production of lard in the United States declined sharply in 1945 from the record of 3,215,000,000 lb. produced in 1944 to 2,230,000,000 lb. in 1945. This was the direct result of the decline in hog slaughter. About 40% of the output of lard from federally inspected pork was required to be set aside for government purchase up to July 29, 1945. On that date the amount was reduced to 25%. Total exports of lard for all purposes amounted to 858,000,000 lb. in 1944 and 650,000,000 lb. in 1945. Stocks were at a record high point of 374,000,000 on Jan. 1, 1945. Consumers were forced to use lard substitutes to an increasing extent in 1945 as the per capita supply of lard dropped to 11.7 lb. from the 13.9 lb. available in 1944. (See also HOGS; MEAT; VEGETABLE OILS AND ANIMAL FATS.) (J. C. Ms.)

**Laski, Harold J.** (1893- ), British socialist and political scientist, was born June 30 in Manchester, England. He studied at New College, Oxford, lectured at McGill University, Montreal, Canada (1914-16), Harvard University, Cambridge, Mass. (1916-20) and was Harvard lecturer at Yale University, New Haven, Conn. (1919-20). He joined the faculty of the London School of Economics (1920). A member of the British Labour party, he was regarded as one of the most lucid expounders of socialist doctrine, and he became chairman of the Labour party executive, 1945. During the British electoral campaign, after the end of World War II in Europe, conservative newspapers painted the socialist leader as a "deep-dyed red" and asserted that he dominated the Labour party as a "one-man brain trust." However, Laski enjoyed no real power in the British Labour party, as the executive committee's authority was restricted to discussion of problems; beyond making recommendations, it had little influence. After the results of the election, posted July 26, 1945, revealed an overwhelming victory for the Labour party, Laski asserted that the party had "won more than a victory. We have sent a message of hope to every democracy in the world." Discussing the social and economic reforms planned by the new Labour government, Laski said (Aug. 1) that the government abhorred exploitation of the many by the few and added that the "masses in any community are entitled to an equal share in the gain as well as in the toil of living." On Sept. 24, Laski called on the U.S. and Great Britain to withdraw recognition from the Franco regime in Spain, which he labelled as a vestigial fascist tyranny that was a product of the "dishonest" prewar policy of non-intervention.

**Latvia.** One of the Baltic states of northeastern Europe, north of Lithuania, south of Estonia, formerly a republic; in 1941 it became part of the German "Ostland"; in 1944-45 it was reconquered by the Soviet forces, and reintegrated into the U.S.S.R. as of the period 1940-41. Area 25,016 sq. mi.; pop. (est. Jan. 1, 1939), 1,994,506. Capital, Riga (385,063 in 1935); the other principal city is Liepaja (57,098). Language, Latvian. Religion, Christian (Protestant 56%; Roman Catholic 24.5%; Greek Catholic 9%; Greek Orthodox 5.5%). Government, according to inadequate reports, was in 1945 largely in the hands of Russian officials.

**History.**—Like its neighbours Estonia and Lithuania, Latvia was forced to bow first to one, then another, of the warring

great powers: from June 1940 to June 1941, it was occupied and largely collectivized by the U.S.S.R.; in July 1941, it was occupied and "new ordered" by the Nazi Reich. Mass deportations were carried through by both the conquerors, and the economy was forced through violent changes. After the soviet reconquest of 1944-45 the constitution of 1940-41 was re-instituted. Many thousands fled to Germany or were transported there as labourers; others risked their lives to evade both Russians and Germans and escaped to Sweden. These refugees told gruesome tales of exploitation and destruction by the Germans and of purges, deportations and forced transformation of the economy by the Russians. The presence of Russians as commissars of the interior (police), and of social welfare, and as directors of the state bank and the railways, chiefs of ports and other high offices, indicated something of the extent of difficulties of the U.S.S.R. in dealing with the nationalistic Letts.

Reports were that in the year after Riga's liberation (Oct. 13, 1944) 3,000 of the city's inhabitants had been liquidated, 8,000 deported to Siberia, and 38,000 skilled labourers taken to Russia for reconstruction work. In the city one bridge over the Dangava was rebuilt as a temporary wooden structure. Fuel was scarce and prices on goods were rising to astronomical figures. Latvian farms were being parcelled into 15-hectare plots, the old owners sent away and Red soldiers established on the land. Churches were forced to disband by various extralegal pressures. The almost complete absence of news about Latvia from Russian sources or from foreign correspondents made it impossible to confirm or to deny the accounts given by those who had fled the country and who were therefore unquestionably opposed to the existing regime.

Britain and the U.S. continued their five-year-old policy of non-recognition of the soviet regime in Latvia (as in the neighbour states of Lithuania and Estonia, *qq.v.*), and the legations lasting over from the epoch of independence continued to function in the western capitals.

**Education.**—In 1938-39 there were 1,987 elementary schools and 122 secondary schools. Enrolment at the University of Riga was 7,281. Total educational enrolment numbered 271,197—one-seventh of the population, with 13,106 teachers, and about 15% of the national budget went to education. There were 912 public libraries.

**Finance.**—The monetary unit was the lat (=19.3 U.S. cents at par, established as equivalent to the Swiss franc in 1921). In 1939 the budget estimates envisaged revenue of 190,878,000 lats and expenditures of 190,481,000 lats.

**Trade and Communication.**—Imports in 1938 were 227,336,000 lats; exports 227,204,000 lats. Chief articles of import were industrial machinery, agricultural machinery, automobiles and accessories, coal, cotton textiles, cotton (raw) and wheat. Chief articles of export were timber, flax, plywood and butter. Exports went chiefly to Great Britain, Germany, the U.S.S.R. and the Netherlands. Imports were primarily from Germany, Great Britain, the U.S.S.R., Sweden and the United States. In 1940 the Latvian state railways operated over 2,200 mi.; bus lines over 2,800 mi. The principal harbours were Riga, Liepaja and Ventspils.

**Agriculture.**—The principal crops with their yields (in short tons) were as follows in 1939: rye, 493,830; barley, 245,041; oats, 534,395; wheat, 233,247; potatoes, 1,807,882; flax, 54,123. Livestock included 414,470 horses, 1,271,730 cattle, 1,469,570 sheep, 891,470 pigs, 4,729,120 poultry, 222,460 beehives. About 66% of the employed were in agriculture, cultivating some 237,000 farms, 80% of which were owner-operated.

**Manufacturing.**—After the decline in 1931 and 1932, Latvia's industrial production rose rapidly to a general index figure of 148 in 1937 (based on 100 in 1930). Strong efforts were made up to 1939 to increase the self-sufficiency of the country.

At the beginning of 1939 some 5,970 industrial establishments employed 98,500 persons, and in 1938 produced a value of 695,000,000 lats. About 15% of the employed were in industry and 5% in commerce. Chief industries were foodstuffs, wood and paper and textiles.

**BIBLIOGRAPHY.**—Alfred Bilmanis, *Baltic Essays* (1945), and *The Church in Latvia* (1945), published by the Latvian Legation, Washington; F. W. Pick, *The Baltic Nations, Estonia, Latvia, Lithuania* (1945). (F. D. S.)

**Laval, Pierre** (1883-1945), French politician, was born on June 28 at Châteldon, Puy-de-Dôme. For his earlier career see *Encyclopædia Britannica*. After the start of World War II, he remained in relative obscurity until Marshal Pétain, following France's collapse in 1940, named Laval his successor as well as vice-premier. Never a staunch believer in

democratic rule, Laval became openly anti-Allied and pro-axis in sentiment and speech and conferred on several occasions with Hitler in 1940. A sudden rift between Pétain and Laval occurred and the latter was dropped from the cabinet, Dec. 13, 1940. He was reinstated with Hitler's help on April 18, 1942, and formed a new cabinet, assuming the title of chief of government. Thereafter, Laval followed an outright pro-Nazi policy. On Nov. 18, 1942, a week after Hitler had occupied all France, Pétain vested in Laval dictatorial powers to make laws and decrees on his own responsibility. Laval instigated the move to send more Frenchmen to work in German factories in 1943, an action which incurred for him the bitter hatred of the majority of his countrymen. In 1944, he warned Frenchmen against co-operating with the Allied armies "when the invasion is launched." After the success of the Allied invasion was assured, he fled to Germany in Aug. 1944. He stayed in the greater Reich until May 2, 1945, five days before Germany's surrender, when he fled to Barcelona in a German plane. He was interned in a fortress prison near Barcelona but was later ordered to leave the country. Laval then flew to Salzburg, Austria, where he surrendered, July 31, to U.S. army forces. He was then transported to Paris for trial. At the trial of Marshal Pétain, Laval admitted, Aug. 3, that he had expressed "hope for a German victory," in a broadcast to the French people in June 1942, but asserted that the broadcast was approved by Pétain himself. Pétain's reply was that he had ordered deletion of this sentiment and assumed that his order had been carried out. At the opening of his own trial, Oct. 4, Laval pleaded his case with skill and cleverness, but five days later, Oct. 9, the Paris high court of justice convicted him on charges of plotting against the state and of intelligence with the enemy and sentenced him to death. On the day he was notified that he was to be shot by a firing squad, Laval swallowed poison in an attempt at suicide. He was resuscitated by physicians, however, and led out to the execution post where he was shot to death, Oct. 15.

**Law.** Dawn of the atomic age stimulated the development of international legal machinery to prevent war. The obliteration of Nagasaki and Hiroshima in World War II added the problem of world control of atomic energy to the already difficult agenda of the newly created United Nations organization. The United States congress also opened hearings on proposed measures for the domestic control of this new source of power.

The prosecution of 20 Nazi leaders before a four-nation tribunal at Nuernberg introduced a new type of court and a new application of existing principles of law. For the first time in history high military and political officials of a defeated nation were brought before the bar of an international court charged with crimes against world peace and against humanity.

Chiefly significant on the U.S. legal scene in 1945 was the waning of war controls and the first functioning of reconversion laws passed by congress in 1944. Administrative agencies and courts were confronted with problems of job reinstatement for veterans, surplus property disposal, tax readjustments and labour disputes. Released from war pressures, C.I.O. leaders initiated a nation-wide program for pay raises involving the demand for a tie-in between wages and profits which was rejected by corporate employers and evoked proposals for statutory machinery to control strikes.

By various executive orders President Truman laid down reconversion policies, abolished certain war agencies, shifted the functions of others to more permanent departments, withdrew from sale all public lands containing radioactive mineral substances and proclaimed the extension of U.S. control to the sea bed and subsoil of the continental shelf contiguous to the shores of the U.S.

The end of the war did not mean the end of war and emergency laws, however. Attorney General Tom C. Clark announced that federal statutes effective only "in time of war," "during the present war" or "for the duration of the war" would remain alive until the signing of a formal peace treaty unless terminated sooner by appropriate government action. Statutes effective until "the end of the emergency" or "the cessation of hostilities" would terminate only upon formal proclamation by the president. The life of the Second War Powers act was extended to June 30, 1946.

Civil suits filed by the U.S. government during the fiscal year ending June 30, 1945, ran to twice the 1944 volume. The increase was due to price and rationing control cases which were generally disposed of by the entry of consent orders. Out of a total of 60,965 civil actions filed, only 17,855 were brought by private litigants.

Federal criminal indictments and informations increased slightly over 1944, especially for violations of the liquor and motor vehicle theft laws. But war prosecutions declined. New espionage cases dropped from 30 to 19, sabotage cases from 56 to 9 and Selective Service act violations from 6,622 to 4,259. There was, however, a substantial increase in the business of the U.S. court of claims consisting mostly of claims arising out of war activities. The filing of bankruptcy petitions fell to a new monthly low with less than 1,000 in June 1945.

Only the more interesting and important legal developments of a less technical nature are reported in this article.

**Administrative Law.**—Annual scrutiny of the budgets and financial operations of nearly 100 government corporations with tens of thousands of employees and expenditures running into billions was provided by congress with the passage of the Government Corporation Control act.

The fight for over-all regulation of the procedure of federal administrative agencies was revived with the approval (Nov. 19) by the senate committee on judiciary of the pending McCarran-Sumners bill. California became the first state to adopt a comprehensive administrative code prescribing uniform procedure for all state agencies except those set up under laws adopted through the initiative process. In several cases the supreme court reiterated its 1943 Dobson case ruling giving finality to the tax court's findings of fact; but in one case Justice Felix Frankfurter, speaking for a minority of three, protested against "sterile attempts at differentiation between 'fact' and 'law' in the abstract," holding out for an application of the Dobson rule that would support conclusions arrived at through the tax court's specialized training and equipment unless there was a "clear-cut mistake of law" (*Bingham's Trust v. Wemyss*, 65 S. Ct. 1232). The same doctrine of judicial noninterference with agency findings of fact was liberally applied by the court in labour cases.

The court, however, refused to give finality to administrative decisions where it appeared that there had not been a fair hearing. The attorney-general's order for deportation of Harry Bridges was set aside because it was based in part on unsworn statements. The supreme court also held that the Federal Communications commission erred in granting a licence to one of two mutually exclusive radio stations without giving the rejected applicant a hearing (*Ashbacher Radio Corp. v. F.C.C.*, 66 S. Ct. 148).

In three opinions the high court approved of the methods used by the Federal Power commission in arriving at rate reduction orders under the Natural Gas act, but it sent a fourth gas rate case back to the commission for clarification. The court also upheld the price administrator's construction of one of his own price regulations on the ground that his views were not clearly inconsistent with the regulation (*Bowles v. Seminole*

*R. and S. Co.*, 65 S. Ct. 1215). So too the court sustained the power of the wage-hour administrator to prohibit homework in the embroideries industry so as to make a minimum wage order more effective (*Gemsco, Inc. v. Walling*, 65 S. Ct. 605). But a statement by the same administrator as to prevailing practices for computing working time in the soft coal mining industry was brushed aside as legally untenable (*Jewell Ridge Coal Corp. v. Local No. 6167*, 65 S. Ct. 1063).

**Aliens and Citizenship.**—In a 5 to 3 decision the supreme court set aside the order of former Attorney General Francis Biddle for the deportation of Harry Bridges. The west coast C.I.O. leader thus won a fight of more than ten years against the unremitting efforts of industrial and farm organizations, veterans' groups and governmental agencies to send him back to Australia. The supreme court ruled that the expulsion order was based upon a misconstruction of federal statutes and incompetent evidence. Utterances and activities amounting to mere co-operation with the Communist party did not constitute such "affiliation with" a subversive organization as to render an alien deportable under the Immigration act as amended by the Alien Registration act of 1940. Freedom of speech and of the press extends to aliens as well as to citizens, the court said, citing its decision in *Bridges v. California*, 62 S. Ct. 190. Moreover, Bridges had been deprived of a fair trial after the finding that he was a member of the Communist party was supported solely by unsworn statements (*Bridges v. Wixon*, 65 S. Ct. 1443).

The property rights of aliens were at issue in several cases. A decision of the supreme court opened the door for the assertion of claims, running to an estimated total of \$100,000,000, against property vested in the alien property custodian. While the Trading with the Enemy act of 1917 became effective again at the outbreak of World War II, a provision that no debt shall be paid by the alien property custodian unless owing to and owned by the creditor before Oct. 6, 1917, does not apply to property seized in World War II (*Markham v. Cabell*, 66 S. Ct. 193).

A district court had no authority to tie up the property of Belgian, South African and British corporations while a suit was pending against them for conspiracy to monopolize the diamond trade, the supreme court ruled, there being neither statutory nor equitable sanction for such action (*DeBeers Mines, Ltd. v. U.S.*, 65 S. Ct. 1130).

The California supreme court held that the state's Alien Land act does not prohibit a Filipino from acquiring real estate since he is not an alien. Persons born in the Philippine Islands are U.S. "nationals" even though they cannot become citizens (*Alfajara v. Fross*, 159 P. 2d. 14).

**Civil Rights.**—The New York Fair Employment Practices act became effective July 1. It declared the opportunity to obtain employment without discrimination to be a civil right and outlawed discrimination by employers and labour unions against any person because of race, colour, creed or national origin. A five-man commission was set up to enforce the new law. Somewhat less drastic F.E.P.C. acts were also adopted in New Jersey, Indiana and Wisconsin, relying for their enforcement more upon educational than penal provisions. Similar measures were introduced in the legislatures of 20 or more states, and bills for a permanent federal F.E.P.C. were presented to congress but met stubborn opposition from southern Democrats.

The rights of minorities in New York were further reinforced by a unanimous decision of the U.S. supreme court upholding provisions of the state's Civil Rights act which make it a penal offense for labour organizations to deny membership to any person by reason of race, colour or creed. The court ruled that an association of railway mail clerks was subject to this law

and rejected their plea that the 14th amendment guaranteed them the right to discriminate in admitting members (*Railway Mail Association v. Corsi*, 65 S. Ct. 1483).

In a decision of outstanding importance the supreme court affirmed the power of the federal government to punish state officers for violating civil liberties. The court approved the indictment of a Georgia sheriff, policeman and special deputy under the federal civil rights law (18 U.S.C. §52) for beating a Negro prisoner to death, thus upholding the constitutionality of the 75-year-old statute. But the conviction of the defendants was reversed and the case sent back for retrial on the ground that the question of the defendants' intent had not been properly submitted to the jury. The decision nevertheless gave authority for the future use of the federal law as an affirmative weapon against abuse by state officials "under color of law" of the rights guaranteed by the 14th amendment. This result was arrived at, however, only as a compromise by a 5 to 4 vote after strong disagreement between the justices expressed in four separate opinions totalling 22,000 words. Justice Frank Murphy approved the majority view that the civil rights law was constitutional but believed that the conviction of the Georgia officers should have been affirmed (*Screws v. U.S.*, 65 S. Ct. 1031).

The plea of a Negro for reversal of his sentence to death by a Texas court on the ground that there was only one Negro on the grand jury that indicted him was rejected by the federal supreme court. While all of the justices agreed that the 14th amendment forbids race discrimination in selecting a grand jury, a majority of six found that there had been no actual discrimination in this case. Due process does not require proportional representation of the races on grand jury panels, they said. Justice Murphy said that the majority opinion "tarnishes the fact we are one people undivided . . . by differences in race, color or creed." (*Akins v. Texas*, 65 S. Ct. 1276.)

Refusal of the Illinois supreme court to license a conscientious objector to practice law was sustained by the U.S. supreme court. The applicant was otherwise qualified but would not take the required oath that he would support the state constitution because it would have pledged him to perform military service. Denial of a bar licence under the circumstances did not violate the constitutional guarantee against state encroachments upon religious freedom, according to the majority opinion. But a minority of four justices protested against the exclusion from the legal profession of a well-qualified applicant merely because he had religious scruples against bearing arms (*In re Summers*, 65 S. Ct. 130).

Two court decisions aroused the greatest furore in literary and publishing circles since Judge John M. Woolsey's classic opinion exonerating James Joyce's *Ulysses* from charges of obscenity. The Massachusetts supreme court affirmed the conviction of a bookseller under the state's obscenity statute for selling a copy of *Strange Fruit*. Justice Stanley E. Qua, speaking for a majority of six of the court's seven judges, approved the doctrine of the *Ulysses* case that the effect of the entire book, not of isolated passages, upon its "probable audience" should be considered in such cases. Nevertheless the court affirmed the conviction on the ground that sex scenes in Lillian Smith's best-selling novel of miscegenation went beyond the bounds of decency. Justice Henry Lummas alone dissented on the ground that the book was not a menace to morals.

Opponents of censorship were cheered, however, by the restoration of second-class mailing privileges to *Esquire* magazine. The District of Columbia court of appeals rejected the postmaster general's view that he could deny such privileges to publications which he deemed were bad for the public even though not technically obscene. Justice Thurman Arnold on behalf of

the court deftly disposed of the proposition that second-class privileges could be used as a special award to give competitive advantages to "good" magazines over those the postmaster considered "bad." Denial of second-class rates to *Esquire* would have increased its mailing costs \$500,000 a year (*Esquire v. Walker*, 151 F. 2d. 49).

**Constitutional Law.**—Provisions of the federal constitution were applied by the supreme court in resolving perennial conflicts over civil rights, the extent of federal and state powers, the nature of due process and equal protection of the laws as related both to state and federal procedures, and the legal relationships of the states to one another and to the federal government.

The supreme court for the first time construed the treason clause of the constitution (see *Criminal Law*, below); and in another decision of utmost importance the court agreed to entertain an original suit brought by the state of Georgia against 20 railroads to enjoin a conspiracy to fix discriminatory rates. The complaint, filed by Governor Ellis Arnall as counsel for his state, charged that redress through the Interstate Commerce commission had been limited and tardy. The court recognized the state's right, as *parens patriae*, to maintain suits on behalf of its people "to restrain violation of the anti-trust laws or to recover damages by reason thereof." (*Georgia v. Pennsylvania R.R. Co. et al.*, 65 S. Ct. 716.)

The high court upheld the power of congress to exempt federal housing projects from local and state taxation and the rights of several states to impose special burdens on out-of-state corporations for the privilege of doing business within their borders. It also held the federal civil rights law to be constitutional, but it invalidated the Arizona train limit law and parts of the Texas and Florida union control laws. Other rulings on points of constitutional law will be found throughout this article.

New constitutions were adopted by the states of Missouri and Georgia.

**Criminal Law.**—For the first time in its history the supreme court rendered a decision on the subject of treason. By a 5 to 4 vote the court reversed the conviction of Anthony Cramer, a naturalized citizen of German birth, charged with giving aid and comfort to the enemy in meeting, drinking and conferring with two of the German saboteurs who were landed from a submarine in 1942. There was evidence that the accused was pronazi, had listened to broadcasts by Lord Haw-Haw and other German propagandists and knew or believed that he was dealing with saboteurs. In fact, he accepted more than \$3,000 in currency to be held for the use of the saboteurs. He was found guilty at his trial and sentenced to a fine of \$10,000 and 45 years imprisonment. But the supreme court held that his conviction did not rest "on the testimony of two witnesses to the same overt act" as required by article III, section 3, of the federal constitution. "Every act, movement, deed and word of the defendant charged to constitute treason must be supported by the testimony of two witnesses," said the court. In this case there had been no two-witness proof of what the saboteurs said or in what language they conversed. Nor was there any proof that the defendant gave them any information or other help, even to the extent of paying for their drinks. The majority opinion was written by Justice Robert Jackson who later was appointed U.S. prosecutor of the defendants in the war guilt trial at Nuernberg (*Cramer v. U.S.*, 65 S. Ct. 918).

In another 5 to 4 decision the supreme court reversed the conviction of 24 members of the German-American bund for violation of the Selective Service act. The defendants had advised members of their society to refuse military duty until congress should repeal a provision of the act prejudicial to bund members seeking employment. This in itself did not constitute

counsel to "evade" service, the court held. Nor was the fact that the accused were pro-German and opposed the entry of the U.S. into the war a violation of the act (*Keegan v. U.S.*, 65 S. Ct. 1203). A federal circuit court, however, was less tender in dealing with another nazi sympathizer. It sustained the sentence for life imprisonment and \$10,000 fine for treason against Hans Max Haupt, father of Herbert Haupt, executed nazi saboteur. The defendant had succeeded in obtaining a reversal of the death sentence imposed after his original conviction, but the evidence at his second trial was held to be sufficient to support conviction.

British courts found ample evidence to warrant the conviction for treason of John Amery and the notorious William Joyce, known as "Lord Haw-Haw." Both were hanged. The U.S. poet, Ezra Pound, however, indicted for treason because of fascist paid broadcasts from Italy, was found mentally ill and committed to an institution.

The supreme court reversed state court convictions in a series of decisions. The admission in evidence of a confession obtained by coercion in order to show the voluntary nature of a later confession was a denial of due process, especially when the prosecutor, judge and witnesses were permitted to refer repeatedly to the forced confession (*Malinski v. New York*, 65 S. Ct. 781). The court also held that the failure of trial judges to appoint counsel for defendants in criminal cases was a denial of due process. Petitions by the defendants for writs of habeas corpus should have been granted on the facts alleged. One defendant, convicted of murder by a Missouri court, claimed that the judge had not told him he had a right to counsel. The supreme court held that this was error even though the defendant had not asked to have counsel appointed (*Tomkins v. Missouri*, 65 S. Ct. 370). Moreover a defendant has a right to the appointment of counsel without proof that he has no funds to pay for such service. If he requests counsel, it will be presumed he has no funds (*Williams v. Kaiser*, 65 S. Ct. 363). Nor does a defendant waive the right to counsel by pleading guilty to a criminal charge. The petition of an Indian for a writ of habeas corpus should have been granted where he was sentenced by a Nebraska court for a crime alleged to have been committed on an Indian reservation. The case involved jurisdictional questions which clearly required legal counsel before a guilty plea could be accepted (*Rice v. Olson*, 65 S. Ct. 989).

Attempts to punish perjury must stay within the bounds laid down by law, the U.S. supreme court ruled. A district court conviction of perjury was reversed because it had not been supported by the testimony of two witnesses or one witness and corroborating evidence (*Weiler v. U.S.*, 65 S. Ct. 548). It is also improper to punish a witness for perjury by holding him in contempt of court. A person so charged is entitled to a trial before a jury and not by the judge alone. The exercise of contempt powers in such cases "would permit too great inroads on the procedural safeguards of the bill of rights," said Justice Hugo Black (*In re Michael*, 65 S. Ct. 78).

**Labour.**—The courts upheld the civil rights of workers, non-union as well as union. The supreme court rebuffed the attempt of an association of postal clerks to bar Negroes from membership. Such discrimination was held to violate the New York civil rights law which forbids labour organizations to withhold membership from any applicant because of his race, colour or creed (*Railway Mail Ass'n v. Corsi*, 65 S. Ct. 1483). The California supreme court also struck at race hatred in two decisions which held that the courts will not enforce closed shop agreements on behalf of unions which deny membership to Negroes.

The U.S. supreme court reversed the conviction by a Texas court of R. J. Thomas, United Automobile Workers union presi-

dent, for addressing a labour rally without first obtaining an organizer's card as provided by the state's union control law. The requirements of the statute that paid labour organizers must obtain state registration cards and carry them while soliciting union membership were held by the supreme court to be invalid as abridging the rights of free speech and assembly. Other provisions of the act, prohibiting aliens and felons from serving as union officers or organizers, barring union contributions to political parties and candidates, and requiring unions to keep financial records open to members and state officials and to report certain information to the state annually, were not disturbed by this decision (*Thomas v. Collins*, 65 S. Ct. 315).

The supreme court also swept aside provisions of the Florida union control law as repugnant to the Wagner act. Sections of the statute limiting unions in the choice of business agents to persons who could show citizenship and ten years U.S. residence and giving courts the power to enjoin unions from all activities in the state for noncompliance with various statutory requirements were held to infringe the freedom to bargain collectively guaranteed by the National Labor Relations act (*Hill v. Watson*, 65 S. Ct. 1373).

A three-judge federal district court in Florida upheld a 1944 amendment to the Florida constitution providing that the right of persons to work may not be denied on account of membership or nonmembership in labour organizations. Labour union contentions that this established an anticlosed shop policy in violation of the 1st and 14th amendments were rejected (*A.F. of L. v. Watson*, 60 F. Supp. 1010).

In contrast to the legislative drive against unions in some southern states, Connecticut adopted an act guaranteeing the right of employees to organize and bargain collectively, defining and penalizing unfair labour practices and creating a board to administer the new law.

The supreme court ruled that a combination of workers acting alone is exempt from the operation of federal antitrust laws even though their action may ruin the business of a particular employer (*Hunt v. Crumboch*, 65 S. Ct. 1545). But their immunity ceases as soon as they combine with others outside their membership. A combination of unions, manufacturers and contractors to create a monopoly in electrical equipment in the New York city area through a boycott of goods produced elsewhere was properly enjoined as a violation of the Sherman act (*Bradley Co. v. Local No. 3*, 65 S. Ct. 1533).

Several new issues involving the application and coverage of the Fair Labor Standards act were settled by the supreme court. The employment of underage messenger boys by the Western Union Telegraph company did not violate the child labour provisions of the wage-hour law, the court said in a 5 to 4 decision. Provisions prohibiting the interstate shipment of goods produced in establishments where oppressive child labour conditions exist did not apply to the telegraph company. While messages might be considered "goods," the defendant did not "produce" or "ship" them in interstate commerce. The demand of the children's bureau of the labour department for an injunction against the use of minors by Western Union was therefore denied (*Western Union v. Lenroot*, 65 S. Ct. 335).

In another 5 to 4 decision the wage-hour ruling in the *Muscoda* case, that underground travel time must be included as part of the compensable work week of iron miners, was extended to bituminous coal miners, although the situation was not identical (*Jewell Ridge Coal Corp. v. Local No. 6167*, 65 S. Ct. 1063).

The high court also approved an order of the wage-hour administration outlawing homework in the embroideries trade on the ground that it was necessary for the enforcement of a minimum wage level. The objection that this ruling would

create hardships for a large group of workers contrary to the objectives of the F.L.S.A. carried little weight with the court (*Gemsco, Inc. v. Walling*, 65 S. Ct. 605).

Other wage-hour rulings approved by the court were that the wage-hour act applies to piece-rate workers (*U.S. v. Rosenwasser*, 65 S. Ct. 295), that extra wages paid on a piece-rate basis as an "incentive bonus" must be included in computing the base rate for overtime work (*Walling v. Harnischfeger Corp.*, 65 S. Ct. 1246) and that hourly rates agreed upon for overtime pay, which do not represent the actual amount received by employees, violate the F.L.S.A. (*Walling v. Youngerman-Reynolds Co.*, 65 S. Ct. 1242).

Employees who had signed releases of their rights to back pay due them under the F.L.S.A. were held not estopped from recovering such wages and liquidated damages since their waiver of claims was not the result of the settlement of a bona fide dispute (*Brooklyn Savings Bank v. O'Neil*, 65 S. Ct. 895).

In determining the extent of the wage-hour act's coverage the court applied a test first used in a 1942 decision. Whether office employees and building service workers are engaged in an occupation "necessary to the production of goods for commerce" so as to be subject to the F.L.S.A. depends on whether their work has a "close and immediate tie with the processes of production." The tie was held to be close enough as to building service workers in the administrative office of an interstate milk distributor (*Borden v. Borella*, 65 S. Ct. 1223). But service workers employed by a New York office building corporation were held not subject to federal wage-hour control. The fact that they were employed in a building where more than one-third of the space was used by concerns engaged in interstate commerce did not seriously involve them in the production of goods for such commerce (*10 East 40th St. Bldg., Inc. v. Callus*, 65 S. Ct. 1227). Employees in the central office and warehouse of a chain grocery store, from which some goods were shipped to out-of-state stores, were connected closely enough with interstate commerce to be subject to the F.L.S.A. Nor could the headquarters office be classed as a "retail establishment" exempt from the operation of the F.L.S.A., since it was used for combined wholesale and retail functions (*Phillips v. Walling*, 65 S. Ct. 807).

Orders of the National Labor Relations board directing two corporations to abandon plant rules forbidding employees to wear union buttons, solicit union membership or distribute handbills on company premises during nonworking time were upheld by the high court. The enforcement of such rules constituted unfair labour practices (*Republic Aviation Co. v. NLRB*, 65 S. Ct. 982). The supreme court also blocked the attempt of a department store to by-pass a union representing only 40 of its 5,000 employees. The store's action in applying to the National War Labor board for approval of a wage increase for all its employees without consulting the small union, which had been certified as bargaining agent by the National Labor Relations board, was held to be an unfair labour practice. Justice Harold Burton, newly appointed member of the court, joined with the majority of five justices in this decision (*May Department Stores Co. v. NLRB*, 66 S. Ct. 203).

The legality of the army's seizure of Montgomery Ward & Co.'s Chicago plant under a presidential directive for failure to obey a WLB award was sustained by a federal circuit court as a proper exercise of executive power under the War Labor Disputes act. But the government's victory was fleeting. In November the supreme court vacated the circuit court decision and ordered the case dismissed as moot.

**Marriage and Divorce.**—Proxy marriages between members of the armed forces overseas and their betrothed in the United States, performed by mail, telephone or cable, were

generally frowned upon by public officials. A study made by the National Association of Legal Aid bureaus indicated that no state except possibly Kansas would hold such marriages legal.

Court officials in many cities reported an increase in divorce cases running from 50% to 60% higher than any previous year.

The celebrated case of *Williams v. North Carolina* made its second appearance in the supreme court. In a decision of far reaching effect the court ruled that a state may inquire into the validity of a divorce decree granted in a sister state. The conviction by a North Carolina court of a man and woman for bigamous cohabitation was affirmed. The defendants, originally residents of North Carolina, had each obtained divorces in Nevada from their respective spouses, then married each other, and returned to North Carolina where they lived together as man and wife. The state found that the divorce decrees granted the defendants in Nevada were invalid because they had not acquired bona fide domicile in that state. The supreme court affirmed this decision on the ground that every state has the right to inquire into jurisdictional facts in connection with divorce decrees granted by other states. Justice Wiley Rutledge, one of three justices dissenting, said that the court in its various divorce rulings had "travelled in a domiciliary wilderness, only to come out with no settled constitutional policy where one is needed most" (*Williams v. North Carolina*, 65 S. Ct. 1092).

**Military Law.**—A federal circuit court approved the convictions of two civilians by military courts in Hawaii. One defendant had been sentenced to six months' imprisonment for assaulting marine sentries. The other was given a five-year sentence for embezzlement. Both defendants sought their freedom on petitions for writs of habeas corpus attacking the jurisdiction of the military tribunals on the ground that necessity for military law no longer existed when they were tried. The district court granted the defendants' petitions, but the appeals court ruled that the writ of habeas corpus had been lawfully suspended in Hawaii under territorial and U.S. laws by the governor's declaration of martial law after the Pearl Harbor attack, nor had civil rule been restored at the time of the trials (*In re White* and *In re Duncan*, 146 F. 2d. 576). The federal supreme court agreed to review both cases.

Public protests against the alleged severity of sentences and abuses of justice by courts-martial brought an announcement by Secretary of War Robert P. Patterson that 27,500 cases tried "under the stress of a war fought around the world" would be reviewed by special clemency boards under the supervision of an Advisory Board of Clemency headed by former Justice Owen J. Roberts. The aim would be to adjust sentences which were unduly severe and to reach the highest measure of justice obtainable.

The Selective Service act was extended for one year with a restriction against the use of 18 year olds in combat duty until they have had six months' training. Congress also passed the Armed Forces Voluntary Retirement act of 1945 intended to stimulate enlistments. It suspended the existing limit of 280,000 on the size of the regular army and allowed the army to accept enlistments from all qualified males not less than 18 years old. It also offered special inducements to those who volunteer.

**Patents.**—Stimulus to the revision of patent laws was given by the supreme court's decision in the *Hartford-Empire* case breaking up the patent pool in the glass container industry. The defendants were found guilty of conspiring to restrain trade through agreements controlling more than 800 patents, but the court refused to declare a forfeiture of patent rights as a punishment for the violation of antitrust laws. Such power had not been granted to the courts by congress. (See *Trade Regulation*, below.)

The doctrine of the "paper bag case," that a patentee's failure

to use his invention does not work a forfeiture of his patent, was applied by the supreme court in a 5 to 4 decision. The patent office was directed to issue a patent on a subcombination even though the applicant's purpose was not to manufacture the patented article but to protect a more important complete invention from appropriation by others (*Special Equipment Co. v. Coe*, 65 S. Ct. 741).

In three cases the supreme court applied familiar tests in rejecting patent claims for lack of originality and patentability. The court also denied relief against infringement in one case because the plaintiff did not come into court "with clean hands." But in another case a majority of six justices was severely criticized by Justice Frankfurter for not applying the principle of fair dealing to business deals under the patent laws.

**Price and Rent Control.**—President Truman's announced policy of holding the line on prices and rents found backing in the extension of controls to June 30, 1946, by amendments to the Emergency Price Control act and the Stabilization act. The supreme court sustained the interpretation by the price administrator of a maximum price regulation with the comment that the "court must necessarily look to the administrative construction of the regulation if the meaning of the words used is in doubt." A contest over the constitutionality or statutory validity of the regulation as so construed should be determined in the first instance by the emergency court of appeals (*Bowles v. Seminole R. & S. Co.*, 65 S. Ct. 1215).

The emergency court of appeals supported the authority of the price administrator to fix maximum prices for intoxicating liquor in the dry state of Mississippi. There was no force to the argument that the 21st amendment bars price control in a dry state. Such control rests on war powers and was not abrogated by the 21st amendment. The price control act does not purport to authorize the sale of intoxicants in a dry state and therefore does not conflict with state laws.

Suits for treble damages for violation of the Emergency Price Control act were held by the Rhode Island supreme court to be penal in nature and therefore not within the jurisdiction of state courts. For the same reason a federal circuit court held that such suits lapse with the death of the alleged violator and cannot be maintained against his estate.

The New York court of appeals approved the state's Emergency Rent Control law, placing a ceiling on rents for certain types of commercial property in New York city.

**Taxation.**—With the passage of the Revenue Act of 1945, congress granted the first tax cut in 16 years, to become effective in 1946. About 12,000,000 persons were removed from the 1946 tax rolls and the tax load of some 36,000,000 other individual taxpayers, as well as that of corporations, was lightened. The consequent total reduction in federal revenues was estimated at \$5,350,000,000. The new law was an interim measure adopted in response to pressure for tax relief pending a thorough revision of the entire tax structure scheduled for 1946. The \$500 income tax exemption for each individual, his spouse and each dependent, previously applicable only to the surtax, was extended to the normal tax. The surtax rate on all brackets was reduced by at least three percentage points. The normal tax and surtax were further reduced by 5%. The active service pay of the noncommissioned personnel of the armed services was exempted from income taxes, effective retroactively to all years beginning after Dec. 31, 1940, to the end of the war as proclaimed by the president. Claims for refunds for years commencing before Jan. 1, 1943, were to be filed before Jan. 1, 1947. Pre-service taxes on earned income for any "war year" were made payable over a three-year period. The capital stock tax and all excess-profits taxes on corporations were repealed as of Jan. 1, 1946. The normal tax on corporation incomes was

retained but surtax rates were decreased from a range of 10%-16% to 6%-14%, depending on the size of net income. Social security taxes were frozen at 1% both for employers and employees during the calendar year 1946. The \$5.00 auto use tax was repealed.

Litigation over taxes, state and federal, poured through administrative tribunals and the courts in steadily increasing volume with rulings continuing heavily in favour of governmental agencies against the contentions of taxpayers.

The supreme court upheld 1942 amendments to the Revenue act subjecting the entire value of "community property," including the proceeds of insurance paid for by the decedent, to the federal estate tax. This ruling affected citizens of Louisiana, Texas, California and seven other states, where one-half of a husband's earnings and property "belong" to his wife. Congress has the constitutional power to include the wife's half of such property in the taxable estate upon her husband's death, the court said (*Fernandez v. Weiner*, 66 S. Ct. 178).

In general, legal devices for the avoidance and reduction of taxes fared badly. In two cases the supreme court held that the entire corpus of trusts established by decedents while living were subject to the federal estate tax. The settlors of both trusts had retained "strings" on the disposition of the trust funds under certain contingencies. This rendered all of the trust property subject to death duties under the *Hallock* case rule. (*Fidelity-Philadelphia Trust Co. v. Rothensies*, 65 S. Ct. 508; and *C. I. R. v. Field's Estate*, 65 S. Ct. 511.) The high court also closed the door on the use of single premium life insurance and annuity contracts as a means of avoiding estate taxes where the insured retains a reversionary interest in case he should survive the beneficiary (*Goldstone v. U.S.* 65 S. Ct. 1323).

Attempts to escape the federal gift tax were blocked by the high court in two cases where it ruled that transfers of property by taxpayers to their intended wives in connection with anti-nuptial agreements were gifts subject to the tax, even though the property conveyed was expressly stated to be part of the consideration for the agreement (*C.I.R. v. Wemyss*, 65 S. Ct. 652 and *Merrill v. Fabs*, 65 S. Ct. 655). In two other cases the supreme court considered property transferred to trustees to provide for beneficiaries after reaching a certain age as outside the statutory exclusion of \$5,000 in computing the federal gift tax under the Revenue Act of 1932 as amended in 1935. Such transfers were gifts of "future interests" and not entitled to the exemption (*Fondren v. C.I.R.*, 65 S. Ct. 499 and *C.I.R. v. Disston*, 65 S. Ct. 1328).

The supreme court passed on various technical phases of income tax law, including rulings that dividends of a corporation payable to stockholders of record on a future date are not taxable as income as of the date when the dividend was declared (*Putnam's Estate v. C.I.R.*, 65 S. Ct. 811), and that a taxpayer's honest belief that securities are worthless is not the sole test of their deductibility as a loss in a particular year (*Boehm v. C.I.R.*, 66 S. Ct. 120).

Following precedent, the supreme court affirmed the rights of states to impose heavier tax burdens on foreign than on domestic corporations. The Oklahoma 4% tax on premiums collected by out-of-state insurance companies from Oklahoma residents was held not to violate the 14th amendment (*Lincoln Nat'l Life Ins. Co. v. Read*, 65 S. Ct. 1220). The court also approved the assessment of social security taxes by the state of Washington on a shoe company whose salesmen solicited orders in the state to be filled through offices outside the state (*International Shoe Co. v. Washington*, 66 S. Ct. 154). On the other hand the supreme court maintained the bars against state taxation of federal property. The power of congress to establish low-cost housing projects exempt from state, county and local

taxation was sustained where title to the real estate remained in a U.S. agency (*Cleveland v. U.S.*, 65 S. Ct. 280).

**Trade Regulation.**—In a 5 to 3 decision the supreme court extended the application of the Sherman act by holding that the collection and distribution of news is interstate commerce subject to federal control. The Associated Press, a co-operative association of more than 1,200 newspaper publishers, was directed to revise certain bylaws which had operated in restraint of trade. The bylaws stricken out by the court had forbidden A.P. members to sell news to nonmembers and enabled any member to make it practically impossible for a nonmember in the same city to obtain an A.P. franchise. The freedom of the press guaranteed by the first amendment, said the court, does not include "freedom to continue to keep others from publishing." (*A.P. v. U.S.*, 65 S. Ct., 1307.)

The high court also in part affirmed a district court decree aimed at a monopoly in the glass container industry. The trial, which lasted 112 days, had resulted in a decree of 46 printed pages in which the lower court made 628 findings of fact and 89 conclusions of law based on a printed record of 16,500 pages. The defendants, including all the major glass companies in the industry, their officers and a trade association, were found to control more than 840 patents in the glassmaking machinery. Provisions of the decree directing them to license all applicants to manufacture and use the patented machinery at uniform reasonable royalty rates were approved by the supreme court, but more drastic provisions, which would in effect have divested them of all benefits from their patents, were set aside (*Hartford-Empire Co. v. U.S.*, 65 S. Ct. 815).

In a third antitrust decision the supreme court held that "fair trade agreements" between distilling companies outside of Colorado and wholesalers and retailers within the state, resulting in price-fixing on retail sales of wines and liquors, violated the conspiracy provisions of the Sherman act. The fact that the price-fixing was wholly intrastate was no defense, since the means used extended into interstate commerce. Nor was the prosecution barred by the 21st amendment although it grants the states broad powers to regulate the liquor traffic within their borders (*U.S. v. Frankfort Distilleries*, 65 S. Ct. 661).

The government won another partial victory in its suit for dissolution of the aluminum trust. After a three-year hearing against 63 defendants for a conspiracy to violate the antitrust laws, resulting in 40,000 pages of testimony, a district court had dismissed the case. On review by a circuit court, acting on behalf of the supreme court which had disqualified itself, it was held that the evidence showed a monopoly by the defendants through their control over 90% of the aluminum ingot market. The court directed the lower court to enter a decree restraining "price-squeeze" practices but declined to order the dissolution of Alcoa because of a possible adverse effect on war production (*U.S. v. Aluminum Co. of America*, 148 F. 2d. 416).

As a sequel to the 1944 decision in the *South-Eastern Underwriters* case, upholding the indictment of 198 fire insurance companies for violating the antitrust laws, congress passed a moratorium act providing that until Jan. 1, 1948, the Sherman and Clayton acts would not be applicable to the insurance business.

In four cases the supreme court affirmed orders of the Federal Power commission reducing natural gas rates. Other important rulings (too specialized to review in this article) were handed down by the court in cases relating to banking, carriers, communications and fair trade practices.

**Veterans.**—Selective Service headquarters issued a handbook on the re-employment rights of veterans, advocating the doctrine of superseniority and interpreting various statutory provisions. By superseniority is meant the absolute right of a veteran

to his old job or one of like seniority, status and pay, even though this may result in displacing an employee with greater seniority who has not seen war service. The only valid ground for denying a veteran re-employment, according to this view, is "that the employer's circumstances have so changed as to make it impossible or unreasonable" to take the veteran back.

The superseniority doctrine was applied by a federal district court in Brooklyn. A veteran "is entitled to come back to his work . . . in preference to anybody else who might be working on any of the days that he applied for work, except a veteran in his own category." Another district judge in Illinois, however, rejected this proposition. Reinstatement of a veteran cannot lawfully be enforced, he ruled, if it means the transfer, demotion or discharge of nonveterans with longer work records.

Congress adopted amendments to the G.I. Bill of Rights, liberalizing provisions for medical care, education and loans to veterans. Another law established a department of medicine and surgery in the Veterans' administration. (See also AGRICULTURE; BANKING; BUSINESS REVIEW; CONSUMER CREDIT; PATENTS; PUBLIC UTILITIES; RELIEF; TAXATION; WAR LABOR BOARD, NATIONAL; WAR PRODUCTION BOARD.) (M. DN.)

**Lawn Tennis:** see TENNIS.

**Lawrence, Ernest Orlando** (1901- ), U.S. physicist, was born Aug. 8 in Canton, S.D. He received his A.B. degree at the University of South Dakota, Vermillion, S.D., 1922. Dr. Lawrence took his Ph.D. at Yale university, New Haven, Conn., 1925, was awarded honorary degrees as a doctor of science by a number of leading universities in the United States, and was a National Research Fellow in Physics at Yale, 1925-27. He was appointed assistant professor of physics at the University of California, Berkeley, Calif., in 1927, becoming a full professor in 1930. An outstanding physicist, Dr. Lawrence was an authority on nuclear, biological and medical physics. He was a pioneer in the development of the cyclotron—his first model weighing 60 tons was built in the late 1920s. Subsequently, he designed a 200-ton mechanism and for this achievement, in addition to his atomic research, he was awarded the Nobel prize for physics in 1939. He became a member of the consulting board of the Institute of Cancer Research at Columbia university, New York city, 1935, and was awarded a number of medals for his work in atomic research and related fields. Dr. Lawrence played a prominent role in the development of the atomic bomb. It was announced (Aug. 6, 1945) that he was a member of a four-man advisory group that assisted a special U.S. government interim committee on direction, control and use of atomic energy in postwar problems. Dr. Lawrence predicted (Dec. 9, 1945), that the new 4,000-ton super cyclotron under construction at the University of California would bring science into a "new realm of the atom." He also said it was possible that the new cyclotron would make possible artificial production of cosmic rays.

**Lead.** With the removal of censorship in 1945, the gaps in the world table of production were gradually being filled in, but many of the figures in Table I are estimates.

Table I.—World Smelter Production of Lead, 1940-44

	(Thousands of short tons)				
	1940	1941	1942	1943	1944
Australia . . . . .	300	350	310	300	?
Belgium . . . . .	61	22	22	22	?
Burma . . . . .	90	100	15	6	?
Canada . . . . .	220.5	222.6	243.3	224.5	143.7
Germany . . . . .	193.2	190.5	161.4	182.8	183.1
Mexico . . . . .	211.6	166.7	212.7	234.2	196.5
U.S.S.R. . . . .	80	100	110	140	?
United States . . . . .	516.6	544.7	548.8	469.5	464.6
Total (est.) . . . . .	1,980	2,040	2,080	1,930	?

Sharp declines in output were found in most countries in 1944; a drop of 14% is noted in countries that in 1943 furnished 65% of the world total.

In 1945 Canada showed some recovery from the 1944 decline, with 123,542 tons in the first three quarters, 15% more than in the same period of 1944.

**United States.**—The salient features of the lead industry in the United States are presented in Table II.

Table II.—Data of Lead Industry in the U.S., 1940-44

	(Thousands of short tons)				
	1940	1941	1942	1943	1944
Mine output . . . . .	457.4	461.4	496.2	453.3	416.9
Refinery output . . . . .	533.2	571.0	566.8	469.6	464.8
Domestic ores . . . . .	433.1	470.5	467.4	406.5	394.4
Foreign ores . . . . .	100.1	100.5	99.5	63.1	70.3
Secondary recovery . . . . .	260.3	397.4	323.0	342.1	331.4
Imports . . . . .	282.5	381.2	492.5	319.1	321.3
Exports . . . . .	49.1	14.4	5.8	13.3	15.5
Consumption . . . . .	782	1,050	1,043	1,113	1,119
Stocks, year-end . . . . .					
Producers . . . . .	143.4	100.1	117.2	129.5	125.1
Consumers . . . . .	78.5	101.0	81.7	115.2	89.7
Government . . . . .	?	?	248.4	173.9	90.5

The decline in domestic production that had been under way after 1942 continued in 1945, the mine output for the first three quarters of the year being 290,942 tons, a decrease of 8% from the same period of 1944. (See also MINERAL AND METAL PRODUCTION AND PRICES.) (G. A. Ro.)

**League of Nations.** Events in 1945 inevitably affected the whole position of the League of Nations. Doubts about its future which had been felt in 1944 became certainties as a result of the San Francisco conference and the sudden collapse of Germany and Japan. It was decided to set up a new world peace organization.

The United Nations charter, which was to take the place of the old covenant, borrowed its key principles straight from the league, as well as most of its main organs, a general assembly, council, secretariat and court of justice. But the emphasis was different. Lessons had been learned during 25 years and additions made. Collective action against aggression still stood in the forefront, but it was to be the sole job of the new security council, and there were restrictions against its use against any of the great powers. International co-operation, the other main plank of league policy, had become more imperative for peace than ever. Thus the social and economic activities of the league, following out suggestions made in the Bruce report of 1939, had been both concentrated for the purpose of more efficient machinery, and expanded to larger fields. The new social and economic council, working under the general assembly, would deal with or supervise the work hitherto done by most of the league's technical organizations, as well as the I.L.O., and with new problems such as the rights and fundamental freedoms of human beings. The league's mandates system, also, was to be taken over by a new body, the trusteeship council, while all the United Nations joined a general declaration on colonial policy, going beyond anything in the covenant.

During the year 1945 the league, therefore, was restricted, on a meagre budget, to short-term activities. The health organization continued working at Geneva, and the drug control committee at Washington. The financial, economic and transport section at Princeton university went on with their research work and published reports on banking, on economic stability and on commercial policy in the postwar world, on the league's reconstruction loans, and on transport restoration plans after World War I. League experts advised the San Francisco conference, and organs like U.N.R.R.A. were set up for immediate international co-operation after the war.

Late in the year it was decided that the league's supervisory commission, which had been acting for the league since war prevented any session of assembly or council, should take in

hand at once provisional terms of transfer—including material and financial assets—to the United Nations organization. These terms were to be laid for approval before the final League of Nations assembly early in 1946 when they would then be referred for authoritative decision to the first general assembly of the United Nations, who already had done preparatory work and reported on the transfer question through a small executive committee in London. Thus, in 1946 the original great experiment of the League of Nations was to make way for the second attempt to set up a world peace organization, the United Nations. (See also DRUGS AND DRUG TRAFFIC; MANDATES; UNITED NATIONS CONFERENCE ON INTERNATIONAL ORGANIZATION.)

(M. Fe.)

**Leahy, William Daniel** (1875- ), U.S. naval officer, was born at Hampton, Ia., on May 6. He was graduated from the U.S. naval academy, Annapolis, Md., in 1897. He was commissioned vice-admiral in 1935 and admiral in 1936.

Upon his retirement from the navy in 1939, he was appointed governor of Puerto Rico. In Nov. 1940, President Roosevelt named him ambassador to the French government at Vichy. In April 1942, Roosevelt summoned Leahy to Washington "for consultations." Though one purpose of this move was to express disapproval of Vichy's policies, his primary purpose was to appoint Leahy chief of staff to the commander in chief. Leahy was named to this newly created post on July 21, 1942. In this capacity he accompanied the president to the international conferences held during 1943 at Quebec, Cairo and Tehran. In Dec. 1944 Admiral Leahy was promoted to the five-star rank of admiral of the fleet. He was one of the party of U.S. diplomats and military chieftains that accompanied President Truman to Berlin for the Potsdam parley (July-Aug. 1945). He opposed the merger of the armed services under a civilian secretary, declaring, Dec. 4, that he could not see "any advantage" in the plan which he said would mean "indefinite disorganization of the military departments."

**"Lend-Lease" Act (H.R. 1776):** see FOREIGN ECONOMIC ADMINISTRATION.

**Leather.** The end of World War II in 1945 removed from the leather industry the strain of military needs which had been its first consideration for four years. However, the industry was left in a weakened condition, with depleted inventories of raw stock and finished leather, and much of its physical structure needing rehabilitation.

Military needs in the United States gave way to civilian requirements officially on Aug. 27, 1945, when an amended and depleted version of conservation order M-310 was issued by the War Production board, removing all restrictions on sale, delivery or use of any type of leather.

At the same time, shoe conservation order M-217 was revised by the WPB and all style restrictions were removed from the shoe industry.

These two actions immediately created an intense demand for more leather for civilian use, a demand which the leather industry could not hope to meet overnight. Civilian pressure was still further intensified when shoes were released from rationing in Oct. 1945, in the face of warnings by leather men that the move might result in overbuying of leather shoes and wiping out of the thin margin of existing stock.

Raw stock problems continued to confront the industry through the year. The U.S. situation was somewhat favourable as to quantity but unfavourable in quality. The world situation was clouded in doubt.

A year-end survey of the U.S. livestock outlook, an important index of tanners' raw stock supplies, was conducted by the department of agriculture. It revealed the probability of a slight increase in total cattle and calf slaughter in 1946. It also showed that by the end of 1945 lamb flocks were substantially reduced.

The wartime reduction of cattle numbers in Europe is shown in Table I:

Table I.—Reduction of Cattle in Europe from Prewar Figures

Austria . . . . .	67%	Greece . . . . .	50%
Belgium . . . . .	15%	Hungary . . . . .	67%
Denmark . . . . .	Slight increase	The Netherlands . . . . .	30%
France . . . . .	35%	Poland . . . . .	67%
East Germany . . . . .	Unknown	Rumania . . . . .	13%
North Germany . . . . .	10%	Russia . . . . .	50%
West Germany . . . . .	40%	Yugoslavia . . . . .	50%

At the close of 1945, the U.S. leather industry estimated that exportable world supplies of cattle hides would be less than 14,000,000 in 1946, compared with a prewar normal of 25,000,000; calfskins 6,000,000, compared with a normal 10,000,000; goat and kidskins 40,000,000, compared with a normal 75,000,000; sheep and lambskins, 85,000,000, compared with a normal 90,000,000.

A further indication of the precarious raw stock outlook at the end of 1945 is shown in Table II of distribution of cattle hides and kips from Argentina, an important source of much of the industry's best raw stock. Table II shows distribution for the first 11 months of 1945 and 1944.

Table II.—Distribution of Cattle Hides and Kips from Argentina, 1945 and 1944

	1945 (11 months)	1944
England . . . . .	2,713,000	2,530,000
U.S. and Canada . . . . .	460,000	1,745,000
Scandinavia . . . . .	240,000	323,000
Mexico . . . . .	172,000	87,000
Spain . . . . .	110,000	196,000
The Netherlands . . . . .	39,000	...
Belgium . . . . .	15,000	...
All other . . . . .	223,000	238,000
Total . . . . .	3,972,000	5,119,000

U.S. cattle and calf slaughter in 1945 was on a par with the preceding year, as is shown in Table III of federal inspected slaughter for the year:

Table III.—U.S. Federal Inspected Slaughter for 1945 and 1944

	1945	1944
Sheep and lambs . . . . .	21,215,000	21,876,000
Cattle . . . . .	14,541,000	13,541,000
Calves . . . . .	7,023,000	7,770,000

The quality of U.S. hides during 1945 was generally unsatisfactory—with the exception of big packer hides. While it was acknowledged that manpower shortages were primarily responsible for inferior take-off and quality, almost no justification was found by tanners for the condition of some lots received.

The tanning material and chemical situation continued acute on some materials during 1945. Chestnut extract was still very scarce, with no appreciable improvement in sight for 1946. Quebracho supplies were lowered by increased costs of production and delivery from Argentina, and the Office of Price Administration approved price increases to stimulate supplies of this important tanning material.

Production of major types of leather in 1945, compared with 1944, 1943 and 1942, is shown in Table IV.

Table IV.—U.S. Production of Major Types of Leather, 1942-45

	1945	1944	1943	1942
Cattle hides (including kips for side leather) . . . . .	27,636,000	26,028,000	25,656,000	30,828,000
Sole (sides) . . . . .	17,100,000	16,836,000	16,584,000	20,868,000
Belting (butts) . . . . .	1,008,000	1,044,000	1,020,000	1,200,000
Side upper and patent (sides) . . . . .	30,936,000	27,540,000	27,348,000	32,712,000
Bag, case, and strap (sides) . . . . .	1,128,000	1,260,000	1,596,000	1,872,000
Calf and whole kip . . . . .	11,664,000	10,932,000	11,112,000	12,264,000
Goat and kid . . . . .	24,396,000	34,656,000	37,416,000	41,124,000
Cabretta . . . . .	4,464,000	3,228,000	3,420,000	3,360,000
All sheep and lamb . . . . .	30,904,000	53,892,000	59,316,000	53,628,000

For more than four years, during a period of unprecedented

demand and sharply rising costs, the basic price level of leather had been held intact. At the same time, average labour costs rose 40%, tanning materials and chemicals were higher, fuel costs went up, and shipping and overhead were increased appreciably.

In all the divisions of the industry, volume was lower at the end of 1945 than in the base period of Nov. 6 to Dec. 6, 1941, when price ceilings were established, and in some divisions a drastic curtailment of raw stock supplies brought about a particularly sharp increase in unit costs.

Inventory replacement was one of the major problems facing the industry at the end of 1945. Prices of leather remained at ceiling levels, but raw stock and production costs rose as much as 50%. Consequently, to replace a foot or pound of leather required assets sufficient to cover currently greater raw stock costs as well as manufacturing expense.

Tanners were also confronted at the end of 1945 by the problem of leather substitutes, the wartime synthetics developed to meet consumer demands which tanners were unable to satisfy.

Foreign trade resumption was another of the aspects being considered carefully at the end of 1945 by the leather industry. Many countries, such as South Africa, India, Argentina and Brazil made strong efforts to build up their tanning industries. Those governments stimulated technical progress in tanning and encouraged an improvement in the product. The U.S. leather industry was studying a wholly new plan of foreign trade for the coming years. (See also SHOE INDUSTRY.) (R. B. B.)

**Lee, Willis Augustus, Jr.** (1888-1945), U.S. naval officer, known among his men as "Ching" Lee, was born May 11 at Natlee, Ky. He entered the navy in 1904, was commissioned a captain in 1936 and a rear admiral in 1942. Early in the Pacific war, he was assistant chief of staff to the commander in chief of the U.S. Fleet. In Feb. 1942, he became commander of a task force in the Southwest Pacific. He was credited with having turned the tide of battle at Guadalcanal in Nov. 1942 and of having saved the island for the U.S. forces. In the spring of 1944, Adm. Lee directed the attacks on Truk and other islands in the Carolines group with Adm. Marc A. Mitscher; and in the fall of that year he was second-in-command to Adm. Halsey when the 3rd Fleet was engaged in the Formosa and Ryukyu areas. Shortly before the war ended in the Pacific, Adm. Lee was returned to the U.S. and was assigned to a special top-secret tactical mission in the Atlantic. He died of a heart attack on board ship in Casco bay, Aug. 25.

**Legislation:** see BUSINESS REVIEW; LAW.

**Lehman, Herbert H.** (1878- ), U.S. politician, was born March 28. He was graduated from Williams college, Williamstown, Mass., in 1899. He later entered the textile business and in 1908 became a partner in Lehman Brothers banking house, where he remained until World War I. He joined the army in Aug. 1917, was commissioned a captain and assigned to the general staff. He eventually attained the rank of colonel in the quartermaster corps and was awarded the D.S.M. in 1919. After the war Lehman returned to the banking business. In 1932 he was elected to the first of four terms as governor of New York. Lehman declined renomination in 1942 and was appointed director of foreign relief and rehabilitation by President Roosevelt. In Nov. 1943, he assumed office as director general of the United Nations Relief and Re-

habilitation administration. Lehman announced on May 4, 1945, reorganization of U.N.R.R.A. offices to increase the body's efficiency. Criticism of U.N.R.R.A., which mounted during the latter part of 1945, was climaxed by assertions made by several congressmen returning from a European junket that U.N.R.R.A. was poorly administered. Lehman vigorously repudiated these charges before a senate committee, Sept. 20 and also bluntly denied reports of Russian control of U.N.R.R.A. in "any country." On Nov. 16, Lehman warned a house committee that unless \$1,350,000,000 was appropriated for U.N.R.R.A., a "new tide of social disaster would arise in the already complicated international scene." Many prominent personalities, including Gen. Eisenhower, joined Lehman's request for further funds. The house of representatives and the senate approved the fund by mid-December and then submitted a measure for joint senate-house conference.

**Leopold III** (1901— ), King of the Belgians, born Nov. 3, was the son of King Albert I, whom he succeeded Feb. 17, 1934. He was married Nov. 10, 1926, to Princess Astrid of Sweden, who was killed in a motor car accident in 1935. At the start of the German invasion (May 10, 1940) Leopold assumed command of his armies and appealed to France and Britain for aid. His unconditional surrender of May 28 caused a storm of indignation among the Allies and many of his own subjects branded him a traitor. On Sept. 11, 1941, while in captivity, Leopold was permitted to marry Mlle. Mary Lelia Baels, a commoner, who took the name of Princess de Réthy. Several days after the Allied invasion of Normandy in June 1944, the Germans moved Leopold from his palace at Laeken, near Brussels, where he was being held in custody, to a location deeper within the reich. On May 8, 1945, it was disclosed that U.S. 7th army troops had liberated the Belgian king and his wife near Strobl, Austria. The king's desire to resume his throne was opposed by the Belgian government on charges that his surrender in May 1940 was suspect. Leopold answered (July 19, 1945) that he yielded because he felt that he should stay with his people. Although both houses of Belgium's parliament voted to bar his return, Leopold refused to abdicate and was said to be waiting for a shift in Belgium's political balance from left to right before making another request to return to his homeland.

**Leprosy.** The studies on promin, a sulfone derivate, continued at the National Leprosarium, Carville, La. Made skeptical by previous disappointing experiences with many "false treatments" which raised the hopes of lepers and leprologists over the world, the authors were exceedingly cautious in their statements about the effects of this drug. Altogether 137 patients were treated by courses of the drug given intravenously over periods up to four years. There appeared to be a direct relationship between the length of treatment and the improvement noted. In the entire group 58.4% were reported improved but in 42 patients who were treated for a period of two to three years 73.8% were classified as improved. Only two patients became worse while taking the drug.

The authors believed that promin does exert some specific action on the *Mycobacterium leprae* but were hopeful that a better

drug would be developed by the chemists. They stated, "In the meanwhile promin must be considered the best experimental treatment ever tested at the National Leprosarium." In its present form promin is a drug which can be used in treating leprosy in well-staffed hospitals only. It has to be given by repeated intravenous injections over periods of many months. Careful clinical and laboratory observations are needed to prevent serious toxic effects in many patients.

The patients treated at Carville had moderately or far advanced leprosy of the lepromatous or cutaneous type in which hope for permanent improvement is slight. As few cases reach Carville before the disease is moderately advanced it would be necessary to await reports from countries where leprosy is more prevalent to learn its effect in early leprosy.

Also from Carville a preliminary report was made on a trial of penicillin in treating leprosy. Seven cases receiving the drug for periods up to one month and dosages to 3,240,000 units did not show improvement. The patients had been observed repeatedly for six months after treatment was completed.

During the year appeared a note on a new drug for leprosy which was developed and tried by French physicians in Madagascar. It is a glucoside called asiaticocide and obtained from a plant growing in that area. Encouraging results from its use were claimed but detailed results were not available at this time.

**Lettuce.** The total lettuce crop of 1945 in the United States was estimated by the U.S. department of agriculture at 29,648,000 crates compared with 28,690,000 crates produced in 1944 and a ten-year average of 21,572,000 crates, 1934-43. This was a new high record production of the total crop though the winter crop was slightly smaller than in 1944. The acreage was 172,650 in 1945 compared with 167,980 in 1944 and an average of 153,030 for 1934-43. The yield was also high, 172 crates per acre compared with 171 crates in 1944 and 142 average.

Prices started high in the early spring when the winter crop was about 10% smaller than a year earlier and increased as the season advanced making an average for the year of \$2.92 per crate, compared with \$2.60 in 1944 and an average of \$1.78 for 1934-43. The combined high prices and large volume brought values up to a total of \$86,403,000 for 1945 compared with \$74,199,000 in 1944 and an average of \$38,635,000 for 1934-43. Consumer demand continued high due to the scarcity of canned

U.S. Seasonal Acreage and Production of Lettuce, 1945 and 1944

	Acreage		Production (crates)	
	1945	1944	1945	1944
Early winter . . . . .	39,250	39,850	7,208,000	7,243,000
Early spring . . . . .	56,830	51,760	8,558,000	8,045,000
Late spring . . . . .	5,200	5,470	1,012,000	1,067,000
Summer . . . . .	30,300	30,700	6,596,000	6,143,000
Fall . . . . .	41,070	40,200	6,274,000	6,192,000
Total . . . . .	172,650	167,980	29,648,000	28,690,000

vegetables. The consumption of lettuce had been increasing steadily for several years. The largest increases were in the crops of California in the winter and midsummer crops. Experimental shipments by aeroplane were made to the middle west with promising results. When rates became more stabilized important developments were expected. (See also VEGETABLES.)

(J. C. Ms.)

**Lewis, John Llewellyn** (1880— ), U.S. labour leader, was born Feb. 12 in Lucas, Ia., the son of a Welsh coal miner. After seven years of schooling he was compelled, because of his family's financial need, to

desert his studies and enter the mines. His success as legislative agent for the United Mine Workers of Illinois (1908-11) led to his appointment as American Federation of Labor organizer (1911-17). He returned to the U.M.W.A. as vice-president in 1917, became acting president in 1919, and from 1920 on held the post of president. Lewis had long favoured industrial organization of open-shop mass production industries, contrary to traditional A.F. of L. craft unionism. In 1935 he formed the Committee for Industrial Organization. When he refused to heed the A.F. of L. executive council's order to dissolve the committee, the participating unions in the C.I.O. were suspended in 1936 and the following year were expelled from A.F. of L. membership.

Lewis supported Roosevelt in 1936, but in 1940 he switched his support to Wendell Willkie and promised to resign as C.I.O. chief if Willkie lost. He made good his promise but retained the U.M.W.A. presidency. In Oct. 1942 he led the mine workers out of the C.I.O., and in 1943 negotiated unsuccessfully for re-entry into the A.F. of L.

Lewis made another effort to return to the A.F. of L. fold but was rejected by the latter organization, which asserted (Feb. 15, 1945) that it could not accept his request for a seat on the A.F. of L. council. The U.M.W. staged two major strikes in 1945—one in May and the other in the early fall—both of which were settled to the labour leader's apparent satisfaction. Lewis found fault with Pres. Truman's fact-finding boards and he declared (Dec. 10) that they represented the first step toward an "absolutist" state.

**Ley, Robert** (1890-1945), German politician, was born Feb. 15 in Niederbreidenbach, Germany, the son of a small landowner. He studied at the universities of Jena and Bonn, Germany, received a Ph.D. in chemistry and worked for I. G. Farbenindustrie for seven years (1921-28), before he was discharged for "political activity." He was elected as nazi member to the Prussian diet, 1929, and to the reichstag, 1932. Ley was made head of the German workers' front after Hitler's accession to power. To weld German labour into a solid organization backing the fuhrer, Ley abolished the democratic trade unions and built up a powerful labour organization designed to facilitate German militarization and war preparations. He was also head of the Bund der Auslandsdeutsche (Union of Germans Living Abroad). During World War II, he supervised the mobilization of foreign as well as German labour for war work. Although he had been named in April 1945 as head of a special Adolf Hitler volunteer corps, that was to function as guerrilla fighters, he fled to the mountains near Berchtesgaden where he was captured by U.S. troops, May 16. He attempted to take his life but failed and was arraigned as a war criminal. On Oct. 25 he hung himself with a towel in the lavatory in the Nürnberg prison where he and 23 other nazis were awaiting trial as war criminals. A violent anti-Semite during his tenure as a Hitlerite leader, the workers' front chief left a "political testament," which attributed nazidom's downfall to its vicious anti-Semitism and urged Jews and Germans to reach a "complete reconciliation."

**Liberal Party.** In anticipation of the general election in Great Britain, then expected in the autumn, Liberal political activity became intense in the first half of 1945. At a large and enthusiastic assembly held in the first week of February, Lady Violet Bonham Carter was elected president and shortly after Sir William Beveridge became chairman of the election campaign committee. In spite, however, of the very favourable reception given to Liberal candidates, only 12 out of 305 were elected at the general election which events advanced to July. The leaders of the party were defeated, including Sir

Archibald Sinclair and Sir William Beveridge. The parliamentary party elected Clement Davies, K.C., M.P., as their chairman for the ensuing year, and he appointed T. L. Horabin, M.P., as chief whip. Lord Samuel succeeded Lord Crewe as the leader of the Liberal peers.

The Liberal party polled more than 2,250,000 votes, which on a proportional basis would have entitled them to some 50 seats.

In reviewing the results of the election, candidates generally were of opinion that their greatest handicap in the eyes of the electors was the inability of the Liberal party to form an alternative government if elected, and they considered it imperative to meet the next general election with 500 to 600 candidates.

(W. Rs.)

**Liberia.** This Negro republic lying on the west coast of Africa at the lower curve of the continental bulge, bordering the narrowest part of the South Atlantic bottleneck, is the closest area of Africa to South America. The land (area: 40,000 sq.mi.) was bought in 1820 by the American Colonization society for the purpose of repatriating freed slaves from the United States to the state of their forefathers. England had already established a similar colony on land named Sierra Leone which bounds Liberia on the northwest. Except for Liberia's coastline (350 mi.) the rest of the country is surrounded by French territory: French West Africa and Ivory Coast. It is estimated that of the estimated population of 1,000,000 only 12,000 are descendants of the original colonists from the United States. The remaining majority is comprised of the uncivilized aborigines consisting of 28 tribes speaking as many dialects. The descendants of the U.S. Negroes, known as Americo-Liberians, are the intellectual and ruling class and speak English. The colony declared its independence on July 26, 1847, and adopted a form of government patterned after that of the United States. The president in 1945, the Hon. William V. S. Tubman, was inaugurated in Jan. 1944 for a term of eight years. Liberia, although officially Protestant Christian, grants religious freedom to all and welcomes all sects to evangelize its peoples. The Roman Catholic and Mohammedan faiths were in 1945 increasing in numbers of converts. Most of the tribal population, however, remained pagan.

**History.**—As a result of the defense agreement between the United States and Liberia, signed March 31, 1942, providing for the landing of U.S. troops in Liberia to construct airports and other installations which were used by the bomber ferry command, Liberia's strategic importance brought about a new program of assistance and development toward which the United States government agreed to advance \$12,500,000 for the construction at Monrovia of a port and port works which would aid in Liberia's advancement as well as provide an important naval base on the west African coast. The agreement for the port and port works was contracted between the two governments on Dec. 31, 1943, but the work was not yet completed in 1945. At the request of the Liberian government the services of several technical experts were loaned during 1945 to investigate the iron ore deposits near Monrovia, to assist in the development of agriculture, to plan a program of public health and sanitation and to make a study of the country's natural resources. The possibility of preparing a general plan of economic development was contingent on the result of these findings. Grants by the United States government in the realm of cultural relations were made during 1945 to the Booker T. Washington institute. Aid was given also to the training program of the public health mission.

**Education.**—Primary education which is only nominally compulsory was, during 1945, conducted in fewer than 150 government-supported schools. One source states that there were 87 mission schools and 8 high schools. The College of West Africa,

training teachers, Liberia college specializing in law courses, both in Monrovia, and Booker T. Washington Industrial and Agricultural institute for tribal boys were the most important educational institutions.

**Finance.**—The unit of currency is the Liberian dollar which was, during 1945, equal in value to that of the United States. Liberia operates under a balanced budget. Total revenues reached \$1,598,400 in 1944, of which 42% represented internal revenue and 58% revenues of customs. Imports for that year were valued at \$4,103,908 and exports at \$10,495,452.

**Trade and Agriculture.**—Agriculture is the principal source of livelihood of the tribal Liberians. Some others are fishermen, stevedores and seamen. A few engage in trade. The white collar jobs are held mostly by Americo-Liberians. Manufacturing did not exist in 1945. Rubber was the chief export in 1945 and was grown almost entirely by the Firestone Plantations company, the only large-scale enterprise in the country. Thousands of tribal men were employed during the year on the company's 80,000 ac. of rubber trees, 65,000 ac. of which were producing latex for export. Coffee is indigenous and ranks with palm products and gold as the most important exports.

**Transportation and Communication.**—There was in 1945 no telephone system, and there were no railroads. Both the government and the Firestone company owned and operated radio stations during 1945. A French-owned cable station was located in Monrovia, the capital. There was coastwise air service for mail and passengers, but travel and communication to the interior were matters for individual contrivance. Native carriers take the place of pack animals. Liberia's less than 300 mi. of roads were considerably increased by the American expeditionary force which landed there in 1942. The International Postal union regulates handling of mail. (E. D. Fv.)

**Liberty Ships:** see SHIPBUILDING; SHIPPING, MERCHANT MARINE.

**Libraries.** Among the matters that received consideration in the United States in 1945 the following should be mentioned: (1) aid given to veterans returning to civil life; (2) extension of library service; (3) recruiting and training of librarians; (4) co-operation in the acquisition of materials for research; (5) aid to devastated libraries in war areas; (6) buildings.

Many libraries made special efforts to help men and women discharged from the armed forces. To cite but one example, the New York Public library organized a branch library in the veterans' centre established by the City of New York. In general, appropriations for state library extension were increased, but roughly 26% of the people in the U.S. were still without library service. A survey of New York state, directed by Dr. Warren Coxe, head of the research division of the state education department, with Dr. E. W. McDiarmid, librarian of the University of Minnesota, Minneapolis, as consultant, was nearing completion at the end of the year. The recommendations, it was hoped, would result in increased aid from the state.

Libraries were still handicapped by shortage in personnel, a shortage that was serious in the professional group, critical in the clerical. It was thought that the smaller enrolments in library schools after 1940, caused in part by low salaries, in part by the greater attraction of war jobs would be felt for a long time. The total enrolment (March 1, 1945) in the 34 schools of various types accredited by the board of education for librarianship (American Library association) was 1,348, including 115 advanced and 206 special or nonmatriculated students, an increase of 286 as compared with 1944. Of the total number enrolled 468 were part-time.

Appropriations for tax-supported libraries were, however, maintained or increased, and it was encouraging to note that better salary schedules were reported by many libraries, among them the public libraries of Cleveland, Los Angeles and Seattle, the Carnegie library of Pittsburgh, and the Enoch Pratt library of Baltimore. The proposed new classification and pay plans for the Library of Congress were heartening. With rising costs of service and decreasing returns from investments, the situation of libraries supported by endowments was the cause of grave concern.

The problem of obtaining European books was studied. Until normal commercial channels were reopened it was arranged that the Library of Congress, with the help and approval of the state department, would, on behalf of research libraries, purchase books published from 1939 to 1945, mainly in France, Germany and Italy, and would allocate the materials so secured with the aid of a joint committee from groups interested, the expenses to be shared by the participating libraries. A mission sailed for Germany in December.

The International Relations board of the American Library association continued its program of acquisition of books and periodicals (purchased with funds provided by the Rockefeller foundation) for later allocation to libraries in war areas. In April the American Book Centre for War Devastated Libraries, developed from an idea sponsored by the Council of National Library associations, was incorporated as the co-ordinating agency for the collection and distribution of suitable books. Kenneth R. Shaffer was appointed director with headquarters in the Library of Congress.

Building construction was at a standstill. Information about plans for new buildings may be found in the *Library Journal*. Late in the year ground was broken for the new Princeton university library, Princeton, N.J., to cost \$3,500,000 with space for 2,000,000 books. The new building was named the Harvey S. Firestone Memorial library, in recognition of the gift of \$1,000,000 to the building fund from the family of Firestone. Harvard university, Cambridge, Mass., announced the gift of \$1,500,000 from Thomas W. Lamont of the class of 1892 for the construction of an undergraduate library which was to be erected not far from the Widener and Houghton libraries.

**Size of Collections or Statistics of Libraries.**—There were 21 libraries containing more than 1,000,000 volumes each. In the absence in 1945 of the tables usually prepared by the American Library association these statistics were taken from the *American Library Directory, 1945*, compiled by Karl Brown.

The Library of Congress 7,281,681 vols.; Harvard university 4,608,862 vols. (Widener library 2,466,538 vols.); the New York Public library 4,529,001 vols. (comprising reference department 3,000,611 vols., circulation department 1,429,386 vols., municipal reference library 99,004 vols.); Yale university 3,365,400 vols. (Sterling library 2,456,700 vols.); Cleveland Public library 2,424,031 vols.; Chicago Public library 2,005,055 vols.; Columbia university 1,973,000 vols.; University of Illinois 1,881,432 vols. (Urbana and Chicago); Boston Public library 1,732,395 vols.; University of California 1,692,243 vols. (comprising 1,229,916 vols. at Berkeley, and 462,327 vols. at Los Angeles); Los Angeles Public library 1,649,366 vols.; University of Chicago 1,498,889 vols.; Cincinnati Public library 1,383,764 vols.; University of Minnesota 1,345,809 vols.; Brooklyn Public library 1,235,372 vols.; University of Michigan 1,217,665 vols.; Detroit Public library 1,148,217 vols.; Carnegie Library of Pittsburgh 1,145,908 vols.; Cornell university 1,094,117 vols.; Princeton university 1,017,000 vols.; Army Medical library, Washington, more than 1,000,000 vols. Three libraries possessed close to 1,000,000 volumes each: University of Pennsylvania 997,929 vols.; New York State library, Albany, 980,927 vols.; St. Louis Public library 960,866 vols. The Milwaukee Public library reported 907,550 vols.

Obviously these figures were very uncertain standards of comparison, because of differences in methods of counting, and because public libraries with many branches contained many copies of new and standard books. This troublesome question was discussed by R. B. Downs in "Uniform Statistics for Library Holdings," in the *Library Quarterly* for Jan. 1946.

**Librarians.**—The nomination of Luther J. Evans to be li-

LIBRARY aboard a floating repair shop servicing B-29s based in the Marianas during 1945. The slanting shelves conform to the shape of the ship's hull

brarian of congress, in succession to Archibald MacLeish, was confirmed by the senate on June 29. Dr. Evans had been chief assistant librarian from Nov. 1, 1940. Chalmers Hadley, distinguished librarian of the Cincinnati Public library after 1924, became librarian emeritus at the end of the year, and was succeeded by Carl Vitz, librarian of the Minneapolis Public library, and former president of the American Library association. Joseph L. Wheeler, librarian of the Enoch Pratt Free library of Baltimore, Md., after 1926, retired March 31, and was succeeded June 1 by Emerson Greenaway of the Worcester (Mass.) Free Public library. The Enoch Pratt library, planned by Wheeler, has had great influence on the planning of recent public library buildings. Marian McFadden succeeded Luther L. Dickerson, retired, as librarian of the Indianapolis Public library in February.

Charles F. Gosnell became director of the New York State library (Albany) on Sept. 1. Harold L. Leupp retired from the librarianship of the University of California (Berkeley) and was succeeded on Aug. 1 by Donald Coney, librarian of the University of Texas, who in turn was succeeded by Alexander Moffit, associate librarian. Jerome K. Wilcox, associate librarian of the University of California (Berkeley) was appointed to the librarianship of the College of the City of New York upon the retirement of Francis L. D. Goodrich on Sept. 1. Dr. Lyon Norman Richardson succeeded Herbert S. Hirshberg as director of libraries at Western Reserve university (Cleveland). Eileen Mary Thornton became librarian of Vassar college upon the retirement of Fanny Borden. Carleton B. Joeckel, dean of the graduate library school of the University of Chicago, resigned Aug. 31.

Ralph L. Beals, director of libraries at Chicago, assumed the deanship with Prof. Leon Carnovsky as associate dean. Wyllis E. Wright, chief cataloguer of the New York Public library, was appointed librarian of the reorganized Army Medical library at Washington July 1. Col. Leon L. Gardiner succeeded Col. H. W. Jones as director of the library Jan. 1, 1946. L. Q. Mumford, executive assistant, the New York Pub-

lic library, became assistant director of the Cleveland Public library on Oct. 1.

Wilson and M. F. Tauber, *The University Library; its Organization, Administration and Functions* (1945).

(C. F. McC.)

**Great Britain.**—The use made of British libraries, general and research, continued to increase, and 1945 was a very active year, except during the period of V-1 and V-2 attacks on London and southeast England, when the circulation of books in this area dropped slightly. This phase of World War II brought further destruction of libraries and among those which suffered badly in the capital were Bermondsey, Hackney, Bethnal Green, Hampstead and Leyton public libraries and the well-known London library.

With the end of the war plans were put into effect to return to London and other large centres much of the valuable material which had been evacuated to safer places. Much progress was also made in the scheme for restocking war-damaged libraries in Great Britain and on the continent. In the field of international librarianship, overseas contacts were resumed—some, however, had been maintained throughout the war—and were being strengthened and extended.

Reconstruction plans of the Library association included important proposals for future professional training. A new syllabus was projected for 1946 and arrangements were made for the establishment of new library schools. Monthly leave-courses for about 20 U.S. librarians in the U.S. army were arranged under the "training within civilian agencies" scheme.

**Life Span:** *see* BIRTH STATISTICS; DEATH STATISTICS; INFANT MORTALITY; SUICIDE STATISTICS.

**Lighting:** *see* ELECTRICAL INDUSTRIES.

**Lime.** Demand for agricultural and refractory lime increased slightly in the United States in 1944, while building and industrial demand decreased. The total output declined from 6,596,615 short tons in 1943 to 6,473,563 tons in 1944. The only appreciable tonnage increase in use was for the production of calcium carbide and cyanamide (34%), while magnesium production accounted for the only large decrease (37%). In some of the smaller industrial uses the percentage changes from 1943 to 1944 were rather large, but the tonnages involved were so small as to have little effect on the total.

Canadian production of lime dropped from 907,768 short tons in 1943 to 885,214 tons in 1944. (G. A. Ro.)

**Limes:** *see* FRUIT.

**Limestone:** *see* STONE.

**Linen and Flax.** As World War II hostilities ceased during 1945, production of flax in areas which had shown rapid development during the war years, 1939-45, decreased where cost of production made it uneconomic to continue in competition with older lower cost areas that found themselves able to pick up old threads. Egypt's production during 1945 dropped to prewar level and export controls were discontinued on Dec. 31. Straw production during 1945 dropped to 12,220.4 metric tons, compared with 53,397 in 1944 and 92,052, the peak year, in 1942. The yearly average in 1936-39 was 13,275. Farmers found the steady prices obtainable for barley and wheat preferable to further possibility of drastic reduction in flax prices. In Kenya Colony, Africa, production dropped to half that of 1943 due to the need of raising additional wheat supplies. New Zealand reduced its acreage in 1945-46 to 8,510 ac., compared with 12,599 ac. sown in 1944-45. Further tapering off was expected because of steadily decreasing demands from the United Kingdom. Latvia, Russia, on the other hand, returned to the productive field. By March 1945, Irish and Scottish flax spinners were already planning to process 7,000 metric tons of Russian flax which had reached the United Kingdom. The grading and quality was said to be well up to prewar standards.

Whether the war-born flax and linen industry in Canada and the United States would survive peacetime conditions was too early to determine in 1945. Canada, conscious of the decreasing demand for its native flax as far as the United Kingdom was concerned, erected a new pilot plant at Portage la Prairie, Manitoba, to investigate possible utilization of prairie flax straw for spinning tow, cigarette paper, writing papers and wallboard. A National Flax council was announced in Montreal in November by the Provincial Flax council. Flax growers in all parts

of Canada would be represented to find new outlets for their products. A flax mill would be erected at an estimated cost of \$300,000 for processing tow in its raw state, hitherto sent to Europe.

Similar difficulties faced the producers and processors in the U.S. where costs were considerably higher than prewar foreign flax products.

In this connection, special interest in the U.S. was shown in the report given in Oct. 1945 by John F. Hagen, who had been sent to Germany by army authorities to investigate developments during World War II in German use of flax and hemp. A large volume of textile fibre was obtained by the Germans by utilizing bast fibres obtained from unretted straw of flax and hemp. Because of the lack of cotton, jute and a limited supply of rayon staple, the German textile men blended rayon staple with cottonized flax and hemp which they called *flockenbast*. Production was 12% of the textile fibre production.

The Northern Ireland linen industry in 1945 continued its campaign to offset the invasion of the rayon fabric and garment industry into the Ulster area. Shortage of operatives in the spinning plants was still evident as former workers preferred the rayon staple yarn spinning plants because of their greater cleanliness. In the flax plants, girls worked barefoot in humid rooms and a good operator needed at least three years training. A new fast retting process was announced in Belfast in June, which if developed was expected to increase the fibre yield to an extent that many more tons of flax could be grown without any increase in the labour of the farmer. The British ministry of supply contracted for the entire supply of Eire's flax crop of about 5,000 long tons of retted fibre, a slight increase over the 1944 figure of 4,470 long tons. Acreage planted was 8% greater than 1944.

During the first nine months of 1945, Eire shipped to the United Kingdom 6,349,952 lb. of flax valued at £617,912 and 6,776,672 lb. of tow valued at £658,137.

Belgium was reported as having lost 50% of its flax spinning equipment during World War II. In prewar days, its weaving establishments turned out 175,000 sq.yd. of linen cloth a day but in July 1945 flax spinning mills were operating at 35% of capacity and weaving mills at 40%. The 60 finishing factories in Ghent, where in normal times 95% of the linen production was centred, were working at an average of 30% of capacity. During the first six months of 1945, Belgium's principal customer, Great Britain, bought only 2,113 bales of flax, about one week's take before the war. An Anglo-France-Belgian agreement in March 1945 provided that the total Belgian production would be divided among the three countries, but Belgium was believed to be in need of a large part of the production for relief and domestic needs. The total amount of flax available in Belgium during the first six months of 1945 was about 1,268,000 metric tons.

This comprised 186,000 officially declared, 230,000 bales hidden during the German occupation and undeclared at the end of 1945 and 852,000 bales from Belgian and Belgian-controlled French straw.

Sweden at the end of 1945 was erecting six flax finishing plants with an estimated capacity of more than 2,000 metric tons of fibre daily. The newest factory was to be in Mellansel in northern Sweden and others were at Laholm, Växjö, Kristinehamn, Hybo and Gimo.

**Lions Clubs, International Association of:** *see* SOCIETIES AND ASSOCIATIONS.

**Liquor Control:** *see* LIQUORS, ALCOHOLIC.

**Liquors, Alcoholic.** The ending of World War II in Aug. 1945, marked the close of the beverage distilling industry's contribution to the war effort in the role of a major producer of industrial alcohol for use in making munitions, synthetic rubber, hospital supplies and essential civilian and industrial products. The production of industrial alcohol for the government began in Nov. 1941. The industry had been 100% converted to industrial alcohol production on Oct. 8, 1942, when the production of whisky, gin and beverage neutral spirits had been entirely halted by government order.

From 1942 through the end of 1944, beverage distillers produced 572,800,000 gal. of industrial alcohol, representing 42.5% of the total amount turned out during these war years by all producing sources. It was estimated that beverage distillers turned out an additional 100,000,000 gal. in 1945 before the war ended.

This war effort of beverage distillers severely depleted their aged whisky inventories, since consumers were being supplied with alcoholic beverages during the war, although the whisky supply thus used was not being replaced by new production. Thus, at the end of Aug. 1945, whisky stocks had dropped to 328,062,936 proof gal. (before allowing for evaporation and leakage), representing a 34.4% decline from the industry's stocks of 500,144,220 gal. at the end of Sept. 1942, just before the industry was converted to war alcohol production.

Evaporation and leakage are also important factors in depleting aging inventories. Each year that whisky stays in charred oak barrels during its aging period, a considerable quantity is lost due to evaporation and leakage. For example, at the end of four years, about 22% of the whisky originally stored for aging is lost due to these factors, for which official allowance for tax purposes is made by the U.S. bureau of internal revenue. Thus, the 328,062,936 gal. of original entry gauge in warehouses at the end of Aug. 1945 actually amounted to 256,500,000 gal. after allowing for evaporation and leakage losses.

The industry was given three one-month furloughs from its war job: Aug. 1944, Jan. 1945 and July 1945. Limited beverage production was also permitted in Aug. 1945. However, total production of whisky during these war furlough periods amounted only to 74,001,783 gal., whereas withdrawals from Oct. 1942 through Aug. 1945 totalled 191,053,267 gal.

In order to restore the whisky stocks to the normal levels of about 500,000,000 gal., distillers would have to produce 175,000,000 gal. of new whisky, plus additional production to offset current usage (running around 65,000,000 gal. annually). This would mean sustained production of 240,000,000 gal. over a 12-month interval. But to do this, distillers would require 48,000,000 bu. of grain, about 25,000,000 of which would have to be corn.

However, the industry was restricted on its use of grain from July 1945 through December of that year, thus deferring any attempts toward normalizing stocks. Prior to the industry's conversion to war production, the normal yearly production of whisky was around 120,000,000 gal. Production volume of other beverage spirits was much lower, approximating about 30,000,000 gal. of brandy, 5,500,000 gal. of gin, 3,000,000 gal. of rum and about 20,000,000 gal. of various other spirits including cordials (liqueurs). The relatively low production for rum was chiefly due to restrictions in the quantity of molasses which could be used for distillation by the imposition of quotas.

While no whisky or gin was distilled in the U.S. from Oct. 8, 1942, to July 31, 1944, when grain distilleries were engaged solely in war alcohol manufacture, the distillation of rum (a molasses-base product) and brandy (a wine-base product) was continued.

Distilled spirits production in the fiscal year ended June 30, 1945, amounted to: whisky 41,562,303 gal., gin 2,038,984 gal., rum 2,887,794 gal. and brandy 26,584,256 gal.; total 73,093,337 gal. Production of whisky and gin during this interval only represents the total turned out in the two one-month furloughs (Aug. 1944 and Jan. 1945) granted to distillers during that fiscal period.

The limited resumption of beverage spirits production permitted in 1944 and 1945, enabled distillers to increase withdrawals of whisky from stocks; fiscal year 1945 withdrawals totalled 63,900,310 proof gal. as against 58,832,992 proof gal. in the 1944 fiscal year. This increased amount of whisky was blended with larger amounts of newly produced grain spirits used to make the popular whisky spirit blends. Thus, blending spirits used total 66,271,889 gal. in the 1945 fiscal year as against only 27,492,692 gal. in the 1944 fiscal year.

As a result of more generous withdrawals by distillers, the whisky shortage of 1943 and early 1944 was greatly eased. Total consumption of all distilled spirits in 1944 recovered to 166,382,804 wine gal. from 1943's low level of 145,515,666 gal. In the first half of 1945, rising national income and easier supplies sent consumption up to 88,746,442 gal., a 20.2% gain from the 73,840,736 gal. consumed in the first half of 1944. Full year 1945 consumption was expected to exceed 1944 levels, despite declining national income in the late months of the year.

The interruption of Scotch whisky production in Great Britain (partially resumed early in 1945) resulted in material reduction of imports to the United States, which totalled about 8,000,000 gal. yearly before the war. In 1944, only 5,121,759 gal. of Scotch were imported into the U.S. However, the increased availability of domestic spirits in late 1944 and early 1945 reduced over-all imports, chiefly from Latin-American nations, to 26,264,671 gal. for the fiscal year ended June 30, 1945, from the high level of 51,613,593 gal. for the 1944 fiscal year.

For public revenues in alcoholic liquors see table below.

(A. J. LI.)

**Liquor Control.**—Features of liquor control during 1945 were the easing, though by no means complete removal of production and price regulation, the enormous revenues collected from alcoholic beverages by governmental agencies, particularly the federal, and efforts of state legislatures, by the enactment of new statutes, to make control more effective. These included, among many others, fair trade practise systems, strengthening and enlarging provisions against sales to minors, requirement for a minimum of whisky in bottles labelled whisky, jurisdiction over liquor warehouse receipts, limitation on the number of licences issued, discrimination between on and off premises sale, encouragement of research on liquor problems and establishment of facilities for the care and cure of alcoholism. In many cases these merely enlarged the scope of laws already on the books.

Revenues from alcoholic beverages were the greatest in history. Federal totalled about \$2,500,000,000, state more than \$500,000,000, and local (mainly from licence fees) about \$40,000,000. The rise in the federal rate of taxation in 1944 from \$6 to \$9 a proof gallon did not cut down the demand for liquor. The Distilled Spirits institute summarized the figures for the writer in the accompanying table.

After the end of hostilities, an attempt was made to set a definite date for the reduction of federal taxes to \$6 a gallon as previously provided

Estimate\* of 1945 Revenues from Alcoholic Beverages

Federal		
Distilled spirits . . . . .	\$1,722,000,000	
Wines, cordials, etc. . . . .	47,000,000	
Beer . . . . .	676,000,000	
Import duties . . . . .	55,000,000	
Total estimated federal revenues 1945. . . . .		\$2,500,000,000
State		
State A B C taxes . . . . .	\$ 330,000,000	
State licence fees . . . . .	60,000,000	
Income from state store operation . . . . .	120,000,000	
State sales tax . . . . .	45,000,000	
Miscellaneous . . . . .	5,000,000	
Total estimated state revenues 1945. . . . .		560,000,000
Local		
Estimated local revenues 1945 . . . . .		40,000,000
Total		
Total estimated revenues 1945 . . . . .		\$3,100,000,000

\*Basis of estimate:

Federal—Actual collections first ten months 1945 plus estimated collections for November and December.

State and local—Estimated on increased; apparent consumption plus increased tax rates in six states.

by law. This was not successful. Congress decided that the tax reduction would take place six months after the official termination of World War II and that a tax refund would be given on stocks on hand provided that adequate records had been submitted to the alcohol tax unit and that sale prices reflected the reduction in tax.

A handful of states increased their tax rates. Most remained unchanged. The state tax rate on a proof gallon ranged from 60 cents in Nevada and 80 cents in Arizona and California to \$2.08 in Indiana and \$2.72 in North Carolina.

Federal label regulations were tightened up. Among the changes were rules designed to prevent the use of immature spirits, with concealment of the fact, in rye, bourbon and malt liquors. In some cases the overlapping of federal and state authority caused argument, but no serious controversies arose.

In the states and in local communities many laws and ordinances were passed more effectively locking the doors against sales to minors. Some make the minor equally liable with the purveyor to prosecution and penalty; some forbid the presence in taverns of minors, even when accompanied by parent or guardian; others set up a system of registration and require exhibition of photographs to make deception more difficult.

Fair trade price systems made gains. This plan puts floors under prices, requires that sales may be made only under minimum price resale contracts, and requires price posting with the state authority. This should reduce the possibility of ruinous price wars. Increasingly the states are taking jurisdiction of the sale and transfer of liquor warehouse receipts. A number of states require a licence, or permit, or certificate of approval before an out-of-state supplier can do business within their borders. Trade barriers between states, such as ports of entry, discrimination as to taxes, exemptions to home-grown products were in disfavour and were passing out of the picture. State governors, as a rule, took a strong stand against such practices.

Some states, particularly New Jersey, made appropriations for institutions for the care and cure of alcoholics. Clinics were established in five major cities under medical auspices.

In California and Minnesota minimum ages are required before a product can be sold as whisky. There appeared to be little inclination to follow this lead on the part of other states. Distinction between on and off premises sales and refusal to issue both to one operator was gaining ground.

The control of federal agencies over moonshining and bootlegging continued to be effective. In spite of high prices, arrests and seizures of illicit stills did not show any alarming rise. Sales at over ceiling prices, dilution, mislabelling, etc., were widespread, but did not constitute a major problem.

The attractiveness of the retail liquor business for returned veterans presented some control difficulties. Of those who planned to go into business for themselves the proportion desirous of entering the alcoholic beverage field was remarkably large. Some of the large companies started classes for instruction and many of the trade associations launched similar programs. Some pressure for lower fees and preferential licensing, especially in communities where the number of licences is limited, manifested itself. On the whole the adjustment of the returned soldier to control in the liquor field was most successful.

Self-regulation made some progress. The industry interested itself in the study of alcoholism, and sponsored some research projects. In some cases suppliers refused to sell merchandise to retailers of bad repute. This was effective. The industry, through its public relations organizations, chief of which is the C.A.B.I. (Conference of Alcoholic Beverage Industries) carried on an extensive advertising campaign enjoining the retailer not to sell to minors or intoxicated persons, to close at the required hour and to obey all federal and state laws and local ordinances. (See also BREWING AND BEER; INTOXICATION, ALCOHOLIC; WINES.)

(M. LB.)

**Literature:** see AMERICAN LITERATURE; BOOK PUBLISHING; CANADIAN LITERATURE; ENGLISH LITERATURE; FRENCH LITERATURE; GERMAN LITERATURE; ITALIAN LITERATURE; PRIZES OF 1945; RUSSIAN LITERATURE; SPANISH-AMERICAN LITERATURE; SPANISH LITERATURE.

**Lithium Minerals.** The production of lithium ores and compounds in the United States reached a new record high in 1944; in spite of decreased outputs of amblygonite and lepidolite, gains in spodumene and dilithium sodium phosphate gave a total of 13,319 short tons shipped in 1944, against 8,155 tons in 1943, with lithium oxide contents of 848 tons and 463 tons respectively. With the exception of lepidolite, used in the glass industry, the supply was adequate, and regulations covering allocation of spodumene were revoked in Sept. 1944. Army contracts expiring Dec. 31, 1944, were not renewed, and the largest producer closed down in Feb. 1945.

(G. A. Ro.)

**Lithuania.** A Baltic country of northeastern Europe, N. of Poland; in 1941 it became a part of Germany's "Ostland," and in 1944 was reconquered by the Red armies and re-established as a republic of the U.S.S.R. Area, 22,959 sq.mi.

(1940); pop. (Jan. 1, 1940) 2,879,070. Chief cities of Lithuania are: Vilnius (Vilna, capital, 207,750); Kaunas (152,365). Premier in 1945: Justas Paleckis.

**History.**—The kaleidoscopic changes of centuries of Lithuanian political history were epitomized in 1940–45. Under the control of the U.S.S.R. from June 15, 1940, to June 23, 1941, the Lithuanians then staged a revolution and declared independence; the German armies reached Kaunas on June 24, 1941, but allowed the independent Lithuanian government to function for only about seven weeks; on Aug. 5 this government resigned and the nazi control was complete. During the latter half of 1944 the Russians gradually reconquered the country, and in the early weeks of 1945 drove on into East Prussia.

As in the case of Estonia and Latvia (*qq.v.*) news from Lithuania was scarce and contradictory. Clearly the country was in the throes of serious social, political and economic upheaval. Devastation during the German regime was widespread: The large Jewish population was, according to one report, 70% liquidated, and ghetto atrocity stories were numerous. Patriot underground and guerrilla forces under the guidance of the Supreme Lithuanian Committee of Liberation continually plagued the nazi occupiers and brought on themselves retaliation—the village of Pirciupis was wiped out like Lidice after Lithuanian partisans had killed some German officers on the highway nearby. Eight underground papers were published, and a secret radio station maintained. On their retreat the Germans dynamited or otherwise destroyed both public buildings and small farms. Scores of thousands of Lithuanians were in Germany as prisoners, labourers or political refugees, some 300 had fled to Switzerland and other hundreds to Sweden. During the late fall the U.S.S.R. was attempting to take these people back to Lithuania. Many of the civilian refugees refused to return, and the military personnel staged hunger strikes and tried to delay the evil day. For these groups had fled from the Russians, and feared execution or deportation.

Little was known of the soviet reorganization of Lithuania beyond the obvious efforts toward collectivization and reconstruction of agriculture and industry. Some shifts of population seemed to be taking place, with immigration of Russians and transportation of Lithuanians (83,000 were said to have been sent into Russia as labourers). Food and transportation conditions were almost desperate, and underground opposition evidently continued.

Neither Britain nor the U.S. recognized the legality of the soviet control in Lithuania (*cf.* article on ESTONIA), but nothing was being done to overthrow the *de facto* situation in which Lithuania was the 14th republic of the U.S.S.R. Lithuanian individuals and societies, and the legation in Washington were active in keeping the demand for independence before the public.

**Education.**—In 1938–39 there were 2,335 private schools with 298,429 scholars, and 83 secondary schools and gymnasias with 19,539 scholars. Part of the university at Kaunas was moved back to Vilnius Jan. 15, 1940.

**Finance.**—The monetary unit was the lita (=16.1 U.S. cents at par, established in 1922 as one-tenth the U.S. gold dollar). At the end of 1939 the foreign debt was 68,915,300 litas, and the domestic debt of the government was 65,231,200 litas. In 1939 the budget estimate of the government balanced at 341,785,274 litas.

**Trade and Communication.**—In 1938 imports amounted to 223,686,000 litas, and exports to 233,200,000 litas. Chief articles of import were cotton yarn and thread, woollen yarn and thread, cotton fabrics, woollen fabrics, coal and fertilizers. Chief articles of export were meat, butter, flax fibre, pigs and eggs. Almost 40% of the exports went to Great Britain, 27% to Germany, 5.7% to the U.S.S.R. Imports came 31% from Britain, 24.5% from Germany, 6.7% from the U.S.S.R. In 1938 telephones numbered 26,591; radio sets 53,667; broadcasting stations 2.

**Agriculture.**—Almost 77% of the population was engaged in agriculture, and 49% of the land was arable. Chief products in 1939 and their output in short tons were as follows: rye 726,636; wheat 282,850; barley 282,740; oats 450,841; potatoes 2,290,469; flax fibre 31,416; butter 21,890. The 1939 estimate of livestock was: horses 521,000; cattle 1,004,900.

000; sheep 1,224,000; pigs 1,224,000; poultry 5,130,920.

**Manufacturing.**—In 1938 some 1,441 industrial establishments employed 40,818 people. Meat and fish products were valued at 44,919,000 litas; manufactured timber 12,532,000 litas; tissues and yarns 28,131,000 litas; machines, etc. 13,215,000 litas; leather goods 14,374,000 litas. Lithuania increased industrial production from an index of 100 in 1929 to 354 in 1939. Total industrial production of 1939 was 405,749,000 litas.

**BIBLIOGRAPHY.**—F. W. Pick, *The Baltic Nations—Estonia, Latvia, Lithuania* (London, 1945); C. R. Jurgela, K. Grečys, S. Sužiedėlis, *Lithuania in a Twin Teutonic Clutch* (New York, 1945); *Lithuanian Bulletin* (New York); *Current News on the Lithuanian Situation* (Washington). (F. D. S.)

**Livestock.** The total number of livestock on United States farms passed its high peak in 1944 and began a decline that continued through 1945. On Jan. 1, 1945, the total was less than Jan. 1, 1944, in all species except milk cows as shown in the accompanying table. The most marked decreases were in the numbers of hogs, sheep and poultry. In terms of animal units, which allows for the differences in size and feed requirements of the different species, the number on Jan. 1, 1945, was 6% below 1944 and 2% below 1943 but larger than any other year in 20 years. In terms of grain-consuming units the decline was 14% and in hay and pasture units 2%.

The total value at \$8,400,000,000 on Jan. 1, 1945, was 7% below Jan. 1, 1944, and 8% below the year of top value, 1943. The value per head was lower at the beginning of 1945 as well as numbers.

Numbers of Livestock on U.S. Farms on Jan. 1, 1945, 1944 and 10-Year Average

	1945	1944	1934-43 av.
Horses . . . . .	8,897,000	9,302,000	10,872,000
Mules . . . . .	3,408,000	3,531,000	4,275,000
Cattle . . . . .	81,760,000	82,364,000	70,237,000
Milk cows . . . . .	27,785,000	27,656,000	25,583,000
Sheep . . . . .	47,945,000	51,769,000	52,941,000
Hogs . . . . .	60,660,000	83,852,000	52,777,000
Chickens . . . . .	511,130,000	576,441,000	433,638,000
Turkeys . . . . .	7,491,000	7,572,000	6,663,000

The changes involved a decline of hogs to 60,660,000 head on Jan. 1, 1945, from 83,852,000 on Jan. 1, 1944, and 28% from the high record of 1943. This was the result of a 27% decrease in the 1944 pig crop and the record slaughter of hogs in

**TAGGING** a new-born ewe at the Uplands stock farm near Los Angeles, Calif., in 1945. The farm sells breeding ewes and raises black sheep for Persian lamb, Karakul and broadtail skins

1944. The number of sheep declined 7%, cattle 1% and poultry 11%. These changes were generally attributed to the scarcity of feeds in 1944 and to the less favourable relationship of livestock prices to feed prices. At the beginning of 1945 and during the year the feed situation improved rapidly and the supply of feed grains in relation to the number of animals was 27% larger than a year earlier. Hay supplies were about 1% lower however.

The total sales of meat animals in 1945 was about the same as in 1944 at about \$5,700,000,000 compared with the high total of \$5,900,000,000 in 1943. Higher prices mostly offset the reduced marketings. With the end of World War II the uncertainties of the future markets were expected to be reflected in further reductions in total livestock numbers unless very favourable crop yields greatly increased the supply of feeds. (See also AGRICULTURE; CATTLE; HOGS; HORSES; MEAT; POULTRY; SHEEP.) (J. C. Ms.)

**Livestock Shows:** see SHOWS.

**Lloyd George, David Lloyd George,** EARL (1863-1945), British statesman, was born in Manchester, England on Jan. 17. His father was a school teacher. He was trained to be a solicitor but, on unexpectedly becoming a member of Parliament for Caernarvon boroughs in 1890, he adopted a political career. He was prime minister 1916-1922.

In his last years he lived quietly on his 800-ac. fruit farm at Churt, Surrey, where he wrote his memoirs. *War Memories* (6 vol.) were published during 1933-36 and *The Truth about the Peace Treaties* (2 vol.) in 1938. He continued to sit regularly in the house of commons as a member of Parliament for Caernarvon boroughs and was "father of the house." He eyed politics critically to the end. When Neville Chamberlain went to Munich, Lloyd George commented, "In my day, they used to come to see me."

Dame Margaret Lloyd George, his wife, died in 1941. In Oct. 1943 he married Frances Stevenson, for 30 years his secretary. In 1944 he retired permanently to Ty Newydd, a small estate in the village of Llanystumdwy, near Criccieth, Wales, where he had spent his boyhood. In the New Year honours of 1945 he received an earldom and took the title Earl Lloyd George of Dwyfor, adopting the name from a turbulent stream that runs through Llanystumdwy. He died at Ty Newydd on March 26. By his own wish he was buried in a spinney on his estate, his remains being carried to the grave on a farm wagon drawn by his favourite farm horse. (See also the *Encyclopædia Britannica*.) (P. Bn.)

**Local Government:** see MUNICIPAL GOVERNMENT.

**London.** In 1945 the last available official figure for the population of London remained that of the 1938 official estimate—8,700,000. The population by 1945 was estimated to be nearing 10,000,000. Population experts anticipated that this figure would be the highest to be reached: declining population would later cause it to taper off. The end of World War II found larger transfers of people within the London region than in previous years, principally from the centre to the outer suburbs. No over-all official figures were available but local town statistics suggested that the 28 central boroughs comprising London county had fallen in population from roughly 4,062,800 in 1938 to less than 3,000,000 in 1945. Migration within London occurred chiefly from those boroughs which suffered heavily from air raids—Stepney, population 200,500 in 1938 declined to 73,030 in 1945; Poplar 134,400 to 54,030; Battersea 141,700 to

ST. PAUL'S CATHEDRAL and adjacent bomb-damaged areas in London, photographed in April 1945

85,380; Bermondsey 97,420 to 44,800 and Fulham 137,700 to 95,090.

The 1945 general election results disclosed a big swing-over in the political allegiance of London. In the 28 boroughs Labour held 49 seats and the Conservatives 12. There was one Independent M.P. Of 2,004,874 registered electors, 68% polled. The total Labour vote was 770,122; the Conservative vote, 472,175. The same tendency was registered in greater London, many well-to-do suburban constituencies returning Labour M.P.'s. They included East Harrow, North Hendon, Wimbledon, South Croydon, Chislehurst, Bexley and Epping.

The municipal elections of November confirmed the tendency. London's 28 inner boroughs elected 22 Labour councils and many of greater London's suburban boroughs went Labour.

"An unhappy and serious deterioration generally in London education" was reported by the London county council during the year. Though the school population of the county area decreased from 450,000 in 1939 to 300,000 in 1945, loss of school premises through air raids and shortage of teachers through war-time enlistment in the armed services produced a crisis in primary education. Classes up to 44 pupils were permitted and, as evacuated children returned to London, classes temporarily rose to 50 pupils in some parts. A class of 56 pupils was reported by a primary school in Croydon. Though independent public schools in London generally raised their day-pupil fees to £17 a term and secondary education was free from April under the new education act, there were unprecedented numbers seeking admission to the public schools.

Shortage of houses was another severe problem in London. In the autumn of 1945 there were still 700,000 houses in the London region that needed further repair of damage done by flying bombs and rockets which fell in 1944. Another 42,000 houses remained too badly damaged to be inhabitable. A labour force of 136,000 men was exclusively employed on bomb-damage repair. Prefabricated houses began to appear in London, mostly on cleared bombed-sites. They included bungalows from the United States. Of 31,800 prefabricated dwellings allocated to the London region, 2,802 had been erected and occupied by the end of September, but the speed of occupation increased toward the end of the year.

During 1945 the London county council started work on the replanning of London. Building of new apartment houses in

Stepney and Poplar began and the reconstruction of the heavily bomb-damaged 1,500 ac. of Stepney was put in hand. Other immediate constructional work announced was that on new roads, to cost £7,000,000; the buying and laying out of 3,000 ac. of land as open spaces on the basis, with existing spaces, of 2½ ac. for each 1,000 population; and the building of houses and flats to densities of 200, 136 and 70 persons an acre according to district. The principle of developing "neighbourhoods" of a self-contained civic kind was followed in accordance with the London county plan.

The plan for rebuilding the City of London—the "square mile" with its own local government—was being reconsidered after government criticism that it was inadequate and did not show St. Paul's cathedral and the Tower of London to sufficient advantage.

The outstanding days of London's social life were those of victory celebration—first of victory in Europe and, later, victory in Japan. The latter festivities were marked by floodlighting parliament and famous public buildings. In June General Eisenhower paid a visit to Guildhall to receive the freedom of the city of London from Sir Frank Alexander, lord mayor. In November the lord mayor's show was revived but the city fathers rode entirely in motor-cars. At previous shows the lord mayor used his gilded coach. The new lord mayor was Sir Charles Davis.

During the autumn London became once again the rendezvous of international conference. The council of foreign ministers was followed by conferences of World Youth, the world Cultural and Educational organization and, late in the year, by the assembly of the United Nations organization.

London was twice visited by notable industrial trouble. Practically all Thames-side dockers were unofficially on strike in sympathy with a Merseyside dispute in the autumn. In November bus crews took the unusual course of preventing passengers standing in buses at the less busy times of the day.

Theatres were crowded during the year, though no notable new play was produced. Music and ballet continued to attract great audiences.

As soon as the war was over river steamers again plied on the Thames. Food shortages and limited labour gave rise to longer queues outside London shops than during any part of the war. Fuel shortage also affected London, street lighting being restricted and normal households limited to two tons of coal or coke over the year. Resumption of the basic gasoline ration in June gave each car owner sufficient gasoline to travel 125 mi. a

month, but the great majority of London car owners did not consider this worth taking out new insurance on their cars. War-time services of trains and road passenger transport continued. (See also CIVILIAN DEFENSE; POWER ENGINEERING.) (P. B.N.)

**London Conference of Foreign Ministers:** see MOSCOW CONFERENCE OF FOREIGN MINISTERS.

**London University.** The revival of university activities made steady progress during 1945. In spite of damage caused to university and college buildings by flying bombs and rockets, work continued without interruption. Because of the serious building situation in London little or no progress could be made in the repair and restoration of damage caused in earlier raids. With the return of peace, applications for admission to the various colleges far exceeded the available places, and the problem of hostel and lodging accommodation in central London was very acute. The number of internal students was 11,182 and the number of external students about 16,000, including members of the forces and prisoners of war. Several notable benefactions were received, including the transfer of the Warburg institute and library for the study of the classical tradition in European culture, the valuable library belonging to Sir Louis Sterling, and Sir Robert Witt's collection of photographs and drawings of works of art. The Nuffield trustees made a grant for the establishment of a chair of child health, Messrs. Courtaulds for a chair of chemical engineering; the Cement Makers' federation for a chair of concrete technology and Imperial Chemical Industries for research fellowships in science. Numerous appointments were made to fill the large number of chairs and readerships which had fallen vacant during the war. The students' union resumed its activities on a limited scale and the university athletic ground was reopened. All but one of the evacuated colleges had been able to return to their London buildings and the university headquarters returned at the end of the year to the senate house. (K. M. E.)

**Loran Navigation:** see RADAR.

**Los Angeles.** Fifth largest United States city in the 1940 census of population, Los Angeles ended 1945 with an estimated population of 1,855,000, a growth of more than 350,000 from the 1940 figure of 1,504,277. In area, Los Angeles led all U.S. cities with 452.2 sq.mi. Mayor (Dec. 31, 1945) Fletcher Bowron. Los Angeles county, which contributes most of the area to metropolitan Los Angeles (population 3,675,000) had an estimated population of 3,435,000 in 1945 compared with 2,785,643 in 1940.

Again during 1945 Los Angeles continued to hold second place among the war production centres of the U.S. with a cumulative total of more than \$10,370,000,000. Industrial growth, looking toward postwar conditions, continued at an ever-increasing pace, reaching a climax in the month of October when the investment in new and expanded industries equalled the whole year's growth of any year from 1931 to 1940. With increased money in circulation and available to the people, bank debits, post office receipts and agricultural values reached new heights, while the building and construction fields continued their upward trend, already re-established in 1944. Freight car loadings and air mail poundage continued to rise as did department store sales. The closing of World War II opened the way for the restoration of foreign trade.

The retrenchments anticipated by many with the loss of war business did not seriously disturb the situation. A survey conducted with those terminating employment just after V-E day brought out the fact that more than 86% of the men intended

to remain in Los Angeles. A study by a Citizens Reconversion committee revealed that several thousand jobs were available, and that workers had not been too anxious to take up new employment. The return of men from the armed forces, together with the influx of new war workers over a period of three years had created a critical housing shortage.

Assessed valuation for Los Angeles in the fiscal year 1945-46 was \$1,488,773,355. The city tax rate was \$5.6995 per \$100 with the assessment at 50% of fair market value on real estate. The budget for 1945-46 was \$53,640,585 exclusive of the water, power and harbour departments. (L. M. Ebs.)

**Louisiana.** One of the west south central states of the United States, admitted to the union in 1812 as the 18th state, Louisiana is popularly known as the "Pelican state," "Creole state" or "Bayou state." Area 48,523 sq.mi., of which 45,177 sq.mi. are land. Pop. (1940) 2,363,880, of which 1,383,441 or 58.5% were rural and 980,439 or 41.5% urban; 64% native whites, 34.3% Negroes and 1.7% foreign born. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 2,535,385. Capital, Baton Rouge (34,719). Other important cities: New Orleans (494,537), Shreveport (98,167), Monroe (28,309), Alexandria (27,066), Lake Charles (21,207), Lafayette (19,210).

**History.**—The general assembly did not meet in regular session in 1945, but a special session was held, Oct. 11-21, to consider postwar problems. This politically harmonious session appropriated \$16,500,000 from the surplus fund to match anticipated federal grants for highway and drainage projects. At the close of the year the chief event of political interest was the New Orleans mayoralty campaign, in which several candidates were entered.

During the spring of 1945 flood waters in the Mississippi and other rivers of the state tested the efficacy of the federal flood control works which had been enlarged and strengthened during the preceding 15 years. After some weeks of feverish activity and anxiety, the engineers in charge of flood control succeeded in holding the levees and minimizing the threatened damage. However, 8,000 families were evacuated from threatened areas and an estimated \$9,000,000 damage was sustained by the agricultural interests in nine parishes, caused chiefly by backwater.

Other important events during the year were: the contest between the state board of education and the state superintendent over the control of departmental personnel, in which the superintendent was successful after the case was carried to the state supreme court; labour difficulties in the Higgins industries at New Orleans, which caused the management to close the plants; the fight of state authorities to prevent the construction of new pipe lines to carry natural gas out of the state; the problem of unemployment following the curtailing of production in defense industries after V-J day; the mounting state income from taxes of all kinds, which reached a new high because of wartime prosperity; state leases of its coastal waters for petroleum exploration.

State officers in 1945 were James Houston Davis, governor; J. Emile Verret, lieutenant governor; Wade O. Martin, Jr., secretary of state; A. P. Tugwell, treasurer; L. B. Baynard, auditor; Fred S. LeBlanc, attorney general; John E. Cox, state superintendent of education; Lucile May Grace, register of land office; Harry D. Wilson, commissioner of agriculture and immigration.

**Education.**—In 1945 the 839 public schools for whites enrolled 196,135 elementary and 69,059 high school pupils and employed 9,819 teachers; the 112 public schools for Negroes enrolled 27,747 elementary and 15,455 high school pupils and employed 1,249 teachers. The 167 private schools for whites enrolled 43,789 elementary and 10,257 high school pupils and employed 1,653 teachers; the 16 private schools for Negroes enrolled 3,381 elementary and 2,812 high school pupils and employed 172 teachers.

Vocational training was stressed and the state maintained ten public trade schools.

State expenditures were \$22,500,000 (exclusive of local funds) for public elementary, secondary and trade schools and \$7,000,000 for state-supported colleges and universities. Most high schools and colleges had increased enrolments due to the close of World War II.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Louisiana expended \$18,775,000 on public welfare work in 1945. Approximately 91,000 individuals were aided, including 36,200 aged persons, 23,620 dependent children, 1,370 needy blind, 500 foster children and 5,760 special cases. The labour shortage and high wages prevailing in industry and agriculture greatly reduced the expenditures for general relief and unemployment insurance as compared with the prewar years, but after the cessation of hostilities unemployment insurance payments mounted steadily during the last half of the year.

The state maintained the following institutions in 1945: charity hospitals at New Orleans, Shreveport, Lafayette, Monroe, Pineville, Independence and Bogalusa; insane hospitals at Jackson and Pineville; a tuberculosis sanitarium at Greenwell Springs; schools for the blind and the deaf at Baton Rouge (for whites) and Scotlandville (for Negroes); training school for the feeble-minded at Alexandria; and soldiers' home at New Orleans.

There were also numerous private and endowed hospitals and orphanages in operation.

The state maintained two prison farms for its 3,500 adult offenders and separate training institutes for about 350 juvenile delinquents.

State expenditures for charitable and correctional institutions exceeded \$10,000,000 in 1945.

**Communication.**—In 1945 Louisiana had 18,200 mi. of public highways, 14,800 mi. of which were state-maintained, 10,500 being gravelled and 4,300 paved; the expenditure for highways was only \$17,500,000, because of shortage of labour and materials for new construction. There were 4,400 mi. of railways and 4,800 mi. of navigable waterways. New Orleans, Baton Rouge and Lake Charles are ports for ocean-going commerce, with combined tonnages of 7,515,000 foreign and 11,556,000 coastwise in 1940. Heavy tonnages of bulky commodities, chiefly military supplies, were carried on the Intracoastal canal which crosses the lower section of the state. There were 26 airports for land planes and 11 seaplane bases and anchorages in 1945. Nearly 275,000 telephones were in service in 1945.

**Banking and Finance.**—Louisiana had 31 national banks in 1945, with deposits of \$1,030,000,000 and resources of \$1,080,000,000; and 118 state banks, with deposits of \$440,000,000 and resources of \$465,000,000. There were 67 savings and loan associations, with total resources of about \$85,000,000. State budget for the 1944-45 fiscal year: receipts \$115,000,000; expenditures \$107,000,000. State bonded debt approximately \$150,000,000.

**Agriculture.**—Total value of principal agricultural crops in 1945 was \$217,000,000, compared with \$215,000,000 in 1944; total acreage harvested was 3,624,000, compared with 3,810,000 in 1944. Cash income from crops and livestock was \$270,000,000 in 1945, compared with \$265,000,000 in 1944; from government payments, \$19,500,000, compared with \$15,600,000 in 1944.

Table I.—Leading Agricultural Products of Louisiana, 1945 and 1944

Crop	1945	1944
Cotton, bales . . . . .	395,000	620,000
Corn, bu. . . . .	23,140,000	18,870,000
Rice, bu. . . . .	23,028,000	21,318,000
Sugar cane, tons . . . . .	6,044,000	5,349,000
Sweet potatoes, bu. . . . .	10,724,000	8,100,000
Irish potatoes, bu. . . . .	2,520,000	3,498,000
Oats, bu. . . . .	5,600,000	4,880,000
Hay, tons . . . . .	400,000	388,000
Pecans, lb. . . . .	9,200,000	14,400,000
Peanuts, lb. . . . .	1,785,000	2,480,000
Peaches, bu. . . . .	212,000	216,000
Pears, bu. . . . .	240,000	245,000
Citrus fruits, boxes . . . . .	290,000	360,000

Unfavourable weather during the planting season and shortage of labour and machinery caused a reduction in the acreage of some of the principal crops in 1945, but yields of most crops were larger than anticipated and prevailing prices for crops and livestock were slightly higher than in 1944.

**Manufacturing.**—Wartime demand stimulated the production of refined petroleum, chemicals, synthetic rubber, lumber, cottonseed derivatives and other Louisiana products in 1945, until after V-J day. Nearly 2,000 industrial establishments, employing 150,000 workers and paying \$200,000,000 in wages, produced finished products worth \$1,100,000,000 in 1945, as compared with \$1,200,000,000 in 1944.

**Mineral Production.**—War demands stimulated mineral production in Louisiana during most of 1945, and the total value of minerals produced was estimated at \$275,000,000, compared with \$270,000,000 in 1944. Six new petroleum fields were discovered during the year.

Table II.—Principal Mineral Products of Louisiana, 1945 and 1944

Mineral	1945	1944
Petroleum, bbl. . . . .	132,830,000	131,900,000
Natural gas, M. cu.ft. . . . .	550,000,000	500,000,000
Natural gasoline, bbl. . . . .	2,500,000	2,255,000
Sulphur, tons . . . . .	745,000	712,000
Salt, tons . . . . .	1,500,000	835,000
Shell, tons . . . . .	1,500,000	1,594,000
Sand, tons . . . . .	1,290,000	1,259,000
Gravel, tons . . . . .	2,600,000	2,365,000

**Forest Products, Furs, Fisheries.**—Louisiana forests produced 900,000,000 bd.ft. of lumber and 640,000 cords of pulpwood in 1945, compared with 1,000,000,000 bd.ft. and 664,000 cords in 1944. The 1944-45 trapping season yielded 6,521,767 pelts valued at \$7,898,104, compared with 5,230,480 pelts valued at \$7,364,313 for the 1943-44 season. Louisiana fisheries produced catches valued at \$9,603,210 in 1944, \$3,561,022 represent-

ing fresh-water and \$6,042,188 salt-water varieties, the total value being more than double that of the preceding year. (W. Pr.)

**Luce, Clare Boothe** (1903— ), U.S. playwright and member of congress, was born in New York city April 10. Graduated in 1917 from St. Mary's school at Garden City, Long Island, N.Y., and in 1919 from Miss Mason's Castle school at Tarrytown-on-the-Hudson, she later received an honorary degree from Colby college. She was associate editor of *Vogue* in 1930, and associate editor and managing editor of *Vanity Fair* from 1930 to 1934. In 1935 she married Henry R. Luce, magazine publisher. As Republican nominee for congress from the 4th district of Connecticut (Greenwich) in 1942, she conducted a colourful campaign, and was elected Nov. 3. Mrs. Luce again made headlines at the Republican national convention in June 1944, with a speech about G.I. Jim, dead U.S. buddy of G.I. Joe, "heroic heir of the un-heroic Roosevelt decade." Before the November elections, the president himself called for her defeat, but she was re-elected to congress by a close margin. On Feb. 18, 1945, she assailed the Yalta decisions on Poland, and after a visit to the Buchenwald concentration camp on April 21, she said the atrocities "certainly raise the question of what we should do with Germany after the war." She denounced soviet Russia, declaring that the Russians had instituted a policy of terrorism as a political weapon. She further asserted that 300,000 Russian soldiers in the Balkans had deserted to the nazis. These anti-soviet statements led a Pravda commentator to describe Mrs. Luce as "Goebbels' disconsolate political widow." Mrs. Luce deserted her political role temporarily to play the leading part in G. B. Shaw's *Candida* in a Stamford (Conn.) theatre, Aug. 6. On Sept. 20, she recommended that the U.S. "go underground" to protect itself against possible surprise atomic raids in the future.

**Lumber.** In the United States lumber continued as one of the most critical materials in the conduct of World War II until the Japanese surrender in Aug. 1945. Throughout 1945 demand exceeded the available supply. The demand for lumber during the reconversion period continued in spite of the end of the war. Lumber had not been available for civilian use in any large quantities for several years. The pent-up demand, therefore, was generally regarded as exceedingly high.

This condition was not due to lack of sawmill capacity or available standing timber, but was directly attributed to shortage of labour.

Although a large portion of the lumber demand during the first eight months of 1945 was for war housing and for shipyards, aeroplane factories, box boards and other war industries, the labour situation continued to be very critical. Many sawmills, particularly of smaller capacities, were forced to shut down because of the shortage in man power. Difficulties of securing sufficient logging equipment, trucks and tires also impeded the output of lumber in all parts of the country.

Lumber production during 1945 was about 29,500,000,000 bd.ft. This was divided into about 23,000,000,000 ft. of softwoods or conifers and 6,500,000,000 ft. of hardwoods. The proportion of hardwoods as compared with softwoods increased during the war years. This was true because many materials for the war effort formerly made of metals or other materials were manufactured from wood and especially hardwoods.

Southern pine continued as the leading species produced for lumber closely followed by Douglas fir. Ponderosa pine, produced entirely in the west, principally in Oregon and California, was the third most important species. Other softwoods, such as northern white pine, western white pine and sugar pine, hemlock, spruce, redwood, cypress and cedar were the other important

species produced. The principal hardwoods produced were oak, red gum and hard maple. Other important hardwoods were birch, ash, basswood, beech, hickory, black cherry, tupelo, cottonwood and black walnut.

In several sections of the northeast and the south, both Italian and German prisoners of war were used in the woods to produce saw logs for the lumber industry, as well as pulpwood for the paper industry. In several woods operations both materials were produced from the same forests.

Although large quantities of lumber were shipped abroad to assist in the war effort, practically no lumber moved in the normal export channels for several years. Some effort was made to engage in this export movement during the last three months of 1945 but the total volume was far below normal.

The demand for lumber products increased more for boxes, shooks, crating and other forms of packaging than for any other war use. The repair of damage done to various European and Pacific ports and the construction work incident to war required enormous quantities of lumber. The shipment of foods, munitions, and other war materials required especially large quantities of dunnage, *i.e.*, lumber used in the storing, stowing, and separating different parts of cargo shipments.

Both the lumber industry and many building organizations made plans during the last three months of 1945 to meet the heavy demand for lumber for housing, construction and other projects throughout the United States. Normally about 700,000 dwellings are erected each year in the United States. Preparations were made in many parts of the country to meet the civilian demand for lumber which it was estimated would last for several years.

As soon as labour became available, many mills which were partly shut down during 1945, began to resume operation. The amount produced depended more upon available labour rather than the demand for housing and general construction. Strikes, particularly in the northwest logging operations and sawmills sharply curtailed lumber production of Douglas fir and other west coast woods during the late summer and fall months.

(N. C. B.)

**British Empire.**—The war and its aftermath heavily affected Great Britain's timber trade throughout 1945. In the early months the possibilities of drawing supplies once more from the north European exporting countries began to be explored; but for all immediate needs Britain still had to rely on her own grievously diminished woodland resources, and for imports, mainly on Canada and the United States. Home timber producers in Great Britain were urged to maintain production in 1945 at not less than the 1944 levels (which had shown some reduction from the peak year of 1943). More of the dominion's military forestry units which had been serving in England and Scotland were withdrawn and the *bona fide* home-grown trade was sadly harassed by inadequate labour.

The home-grown trade, however, responded magnificently, as in the earlier war years. Production figures for the United Kingdom home-grown trade were not yet available for the whole war period, but the following table indicates the output in England and Wales, Scotland and Ireland from the outbreak of war in 1939 to December 1943:

	Total (in cu.ft.)
Sawn Hardwoods . . . . .	158,900,000
Sawn Softwoods . . . . .	187,900,000
Sawn Mining Timber . . . . .	72,000,000
Round Mining Timber . . . . .	210,400,000
	629,200,000

The foregoing figures do not include production of large quantities of telegraph and obstruction poles, pickets, timber for wood wool or any of the by-products, nor 4,360,000 railway sleepers.

How home production expanded during the war years may be judged from the figures following. Taking totals of production for Sept. 1939 as 100, the peak year (1943) figures were:

	England and Wales	Scotland
Sawn Hardwoods . . . . .	420	510
Sawn Softwoods . . . . .	570	900
Sawn Mining Timber . . . . .	270	230
Round Mining Timber . . . . .	430	180

Canada continued to be by far the greatest of Great Britain's overseas suppliers. The Canadian timber controller's target for the dominion's lumber production in 1945 was 4,850,000,000 bd.feet measure, as compared with an estimated production of 4,700,000,000 bd.feet in 1944. With an eye to immediate postwar demands a Canada-United Kingdom pact was made, beginning June 1945, providing for the purchase by Great Britain of up to 1,200,000,000 bd.feet per annum for two years.

In the autumn of 1945 Great Britain lifted the statistical "black-out," and initial detailed official trade returns showed that in the first half of 1945 wood and timber imports into the United Kingdom were of the value of £15,192,918 compared with £15,791,384 in the corresponding half of 1944. Of these totals Canada supplied timber of the value of £11,916,132 from January to June 1945, against £9,831,899 in the first half of 1944. By contrast, Canadian supplies in one half of the prewar year of 1938 were valued at only £3,548,686. Supplies to Great Britain from the U.S.A. were £1,662,944 in the first half of 1945 and £4,491,974 in the same period of 1944. (£1 = 403.5 cents U.S.)

**Europe.**—With the end of hostilities in Europe Sweden's export prospects became brighter than for some years. This great producing and exporting country in 1944 had a total export of 135,000 standards, the lowest quantitatively recorded after the establishment of the first steam saw mills in the middle of the 19th century. The total exports planned in 1945 were 750,000 standards. Great Britain, Sweden's leading market, undertook purchases up to April 1946 of 400,000 standards. Finnish shippers also opened negotiations with overseas buyers. Finland, however, had lost important producing areas and, in addition, had to find large timber supplies by way of indemnities to U.S.S.R. The domestic timber needs of the U.S.S.R. were enormous and, although there had been some export of soviet timber, there was no sign as yet of large-scale exporting on prewar lines. Elsewhere in Europe there was a ravenous market. In various countries surveys were still going on in the autumn of 1945 of forest resources, forest losses and timber needs. Germany would probably have to draw from her own forest riches to meet some of her reparations payments. In September a British mission was in Germany for consultations with a view to drawing some million cube of timber in log form to Great Britain for conversion in British saw mills to help the home-grown trade, the activities of which in war time had used up native woodland supplies that, but for the war, would have provided them with raw material for many years. (See also FORESTS.)

FILMS.—*Conservation of Resources* (Encyclopædia Britannica Films Inc.). (N. F.)

**Lutherans.** Notable advances were made in 1945 in the re-establishment of organizational relationships, which were disturbed by World War II, and in the extension of world service, in and through the Lutheran World convention.

The recognition by other Protestant churches of the responsibilities of Lutherans for the churches in Europe, and their disposition to co-operate in the reorganization and re-establishment of Lutheran churches in the prostrated countries, was a big factor in the consideration of the relationship of Lutherans to the World Council of Churches, in process of formation. The participation of all Lutherans in the organization of the World Council of Churches would constitute not less than one-third of the membership of that body.

In 1945 the world Lutheran membership was estimated at 65,000,000. The general statistics for the United States and Canada show 5,561,270 baptized and 3,796,160 confirmed members. Because of war conditions it was impossible to secure accurate European figures—those of Norway, Denmark, Finland, the Baltic states, Germany, U.S.S.R., France and the Balkan states where the Lutheran population was considerable.

Conscious responsibility by Lutherans in America, whose organized life had not been deeply disturbed, and whose material resources had been undiminished, produced a unity in spirit and a co-operation in action never before experienced by the separate bodies in which Lutherans in America have existed. For world relief and for world emergency services Lutherans in America contributed approximately \$5,000,000 in 1945.

Particular activities of Lutherans in America during 1945 may be summarized as follows:

Notable increase of attendance at worship services; almost phenomenal increases in contributions; adequate provision for colleges in transition from war conditions; effective programs for reaching the unchurched and recruiting Sunday-school attendance; collection of funds and approval of plans for new church buildings; and the incorporation and registration of

a special agency for an international relief program, the Lutheran World Relief, Inc. This relief program carried a budget of \$10,000,000. No general conventions were held in 1945. (See also CHURCH MEMBERSHIP.) (W. H. G.)

**Luxembourg.** A grand duchy situated between France, Germany and Belgium. Area, 999 sq.mi.; pop. (est. 1942) 301,000; chief city, Luxembourg (cap. 59,000); language, Luxembourgian (idiomatic) and (officially) French and German; religion, 98% Roman Catholic. Ruler from 1919: Grand Duchess Charlotte. The constitution of 1868, with some important changes in 1919, provides for democratic government through a popularly elected chamber of deputies of 55 members.

The grand duchess, who was forced to flee on May 10, 1940, to escape the invading German armies, returned to her country on April 14, 1945. Economic reconstruction to repair the damages of war began at once. Luxembourg was to receive 0.15% of reparations available from Germany. Luxembourg's chief products, with figures for 1938 in metric tons, were: iron ore (5,140,632), pig iron (1,550,703) and steel (1,436,506). The labour unions were strongly organized in one large federation of labour. (S. B. F.)

**Lynching.** The department of records and research of Tuskegee institute, the recognized authority on this subject, reported only one known lynching in the United States during 1945. This was the lowest annual toll of mob murder reported in the 64 years during which the records had been kept, just as the two lynchings of 1944 marked the lowest record up to that time. The significance of these figures will be best realized by contrasting them with those of previous years, as seen in the accompanying graph. That they are distinctly encouraging to those who believe in law and order is obvious. They can hardly be taken, however, to indicate that crimes of this character would automatically cease and that there would be no further need for vigilance in their prevention. Following are the circumstances of the one reported lynching of 1945, so far as the facts were available:

During the night of Oct. 10-11, Jesse James Payne, 20-year-old Negro awaiting trial on the charge of assault with intent to rape, was taken by unknown persons from the unguarded county jail at Madison, Fla., carried seven miles into the country, and shot to death. A special grand jury was immediately constituted

to investigate the affair and a special agent was put on the case by Governor Millard Caldwell, but no evidence was found as to the identity of Payne's murderers. The manner of their entrance to the jail also remained a mystery. No violence had been used to force an entrance, and Sheriff Lonnie Davis stated that he had the only known key and that he knew nothing whatever about the occurrence till next morning, though he lived adjacent to the jail. Both the grand jury and the governor's investigator absolved the sheriff of participation in the crime or complicity with it. Governor Caldwell, however, issued a statement holding that the sheriff had been guilty of "stupid inefficiency" in connection with the case and that he had demonstrated his "unfitness for the office." "Nevertheless," said the governor, "he was the choice of the people of Madison county (and) stupidity and ineptitude are not sufficient grounds for removal of an elected official by the governor." (R. B. E.)

**Macao:** see PORTUGUESE COLONIAL EMPIRE.

**MacArthur, Douglas** (1880- ), U.S. army officer, was born Jan. 26 in Little Rock barracks, Ark., the son of Lt. Gen. Arthur MacArthur. Graduated from West Point in 1903, he was commissioned in the engineer corps. (See *Encyclopædia Britannica*.)

Following Japan's attack on the Philippines he was renamed a full general by President Roosevelt, Dec. 19, 1941, and led Filipino and U.S. forces in the defense of the islands. Although heavily outnumbered in men and material, MacArthur slowed the Japanese advance and retired to the Bataan peninsula. He left the Philippines on Roosevelt's orders and reached Australia on March 17, 1942, to assume command of the United Nations' armies in the Southwest Pacific. In the fall of 1942, MacArthur opened a campaign on New Guinea that was destined to bring that island under his control and pave the way for the successful Philippines campaign. After the conquest of Leyte (1944) and Luzon (June 28, 1945), he announced July 5, 1945, that the entire Philippines had been liberated. MacArthur was appointed commander of U.S. army forces in the Pacific, April 5, 1945, and his command was extended to include Okinawa and the Ryukyus, Aug. 4.

After Japan's surrender (Aug. 14, United States time), Pres. Truman appointed MacArthur supreme commander of Allied occupation forces for Japan. The general headed the Allied delegation that signed the Japanese surrender terms, Sept. 2, aboard the battleship, U.S.S. "Missouri," in Tokyo bay. On Sept. 17, he declared that the occupation was proceeding so smoothly that he would need only 200,000 U.S. troops for occupation purposes within the next six months. This figure was rejected by Pres. Truman, and the state department, Sept. 19, said that MacArthur was the instrument, not the maker, of U.S. foreign policy. MacArthur criticized obliquely (Dec. 30) the Big Three agreement to establish an Allied Control Council for Japan, but asserted that he would try to make the plan work, regardless of its "merits or demerits."

**McCain, John Sidney** (1884-1945), U.S. naval officer, was born Aug. 9 in Carroll county, Miss. He was educated at the University of Mississippi, University, Miss., and was graduated from the U.S. naval academy at Annapolis, 1906. He served in World War I with a cruiser on escort duty and later was assigned to an executive post in the navy's bureau of navigation. Intensely interested in naval aviation, he became a navy pilot in 1936 and was made commander of the fleet air base in the Canal Zone. In 1941 he was designated commander of the aircraft scouting force, and after the outbreak of World War II he commanded, during

LYNCHINGS in the U.S. from 1882 to 1945, based on figures of the department of records and research, Tuskegee institute

## McCORMACK, JOHN—MACHINERY AND MACHINE TOOLS 451

early 1942, all naval aircraft in the South Pacific area. He was returned to a desk job in Sept. 1942 as chief of the bureau of aeronautics, and was made vice admiral and deputy chief of naval operations in July 1943. Later, he was returned to active duty, and in Oct. 1944 he succeeded Adm. Marc A. Mitscher as commander of the huge navy task force 58. His carrier force participated in the battle for Leyte gulf in October of 1944 and later attacked Japanese targets along the China coast. After that campaign, McCain was given a brief rest before resuming his command in the spring of 1945. He directed the beginning of the powerful carrier plane strikes on Tokyo in July 1945, sending aloft as many as 2,000 aircraft in a single day. From the spring of 1945 until the truce of Aug. 14, McCain's task force was credited with having destroyed or damaged 6,000 Japanese planes and with having sunk or damaged 2,000,000 tons of Japanese shipping. The tension and strain of the last four months of the war told on McCain who died of a heart attack at his home in Coronado, Calif., Sept. 6.

**McCormack, John** (1884-1945), U. S. tenor, was born June 14 at Athlone, Ireland, and became a naturalized U.S. citizen in 1919. For his early career see *Encyclopædia Britannica*. World famous for his triumphs in opera, on the concert stage and in recordings, McCormack modestly refuted the praise of his admirers who called him the greatest tenor, saying that that honour belonged to the late Enrico Caruso. He was undisputably one of the wealthiest singers in history (his income from stage appearances and recordings was put at \$300,000 in 1918). Of his vast repertory, "Mother Machree" and "I Hear You Calling Me" were the favourites of his audiences. On his 25th anniversary as a concert singer, a London audience mobbed him into singing 27 selections and encores. At his farewell concert appearance at Albert hall in London in 1938, a huge audience of 9,000 gave him a rousing ovation. He later retired, living in the United States and England. He did, however, return to London during World War II to sing for the Red Cross, but was obliged to quit when his health began to suffer. He died at his home in Booterstown, near Dublin, Sept. 16.

**McGuigan, James Charles** (1894- ), cardinal archbishop of Toronto, Canada, was born at Hunter River, Prince Edward Island, on

Nov. 26. He was ordained May 26, 1918, named chancellor of Edmonton diocese in 1922, and vicar general of the see the following year. In 1927 he was named prothonotary apostolic and rector and president of the newly established St. Joseph's seminary. He later received a doctorate in canon law at Catholic University of America, Washington, D.C.

Consecrated archbishop of Regina May 15, 1930, he served for four years, during which period he gained nation-wide renown for his guidance in relieving distress among all classes and creeds when Saskatchewan suffered one of its most severe droughts. He was named archbishop of Toronto Dec. 22, 1934, elevated to Assistant at the pontifical throne and named a Roman count by Pope Pius XII in 1943.

He was included in the list of newly appointed cardinals published on Dec. 23, 1945, and was created and proclaimed cardinal at consistory on Feb. 18, 1946, the first native-born, English-speaking Canadian to be appointed a member of the Sacred college.

**Machinery, Farm:** see AGRICULTURE.

**Machinery and Machine Tools.** Machine tool shipments from builders' plants in the United States for the year 1945 totalled a little more than \$400,000,000 compared with approximately \$500,000,000 in 1944. These totals can be compared with the wartime peak of \$1,321,748,000 for 1942 and the peak of about \$220,600,000 for 1918. These totals are for nonportable power operated machine tools, valued at \$350 or more each, which shape metal products by progressively removing metal in the form of chips. Machines for drilling, turning, boring, grinding, milling, threading, broaching and similar operations are included. Not included are the other metal forming machines, such as presses, forging machines and hammers, extruding machines, brakes and shears, for which comparable totals were not available.

The machine tool industry of the U.S. during the five war-time years of 1941 through 1945, inclusive, made and shipped a total of approximately \$4,193,000,000 worth of products. This is about 12% greater than the \$3,649,100,000 estimated total for the preceding 40 years, from 1901 to 1940, inclusive. This five-year total also can be compared with a total of about

WAR MACHINERY and tools, in one of the huge yards at Detroit, Mich., where such equipment was stored in 1945, pending disposal

\$1,113,000,000 for the five years from 1936 through 1940, and with a total of \$233,000,000 for the five depression years of 1931 through 1935.

Machine tool shipments reached a monthly average of \$110,146,000 in 1942. This was almost seven times the 1939 monthly average and about three times the 1940 rate. Monthly average shipments declined to \$98,351,000 in 1943, to \$41,455,000 in 1944 and to \$38,127,000 during the first seven months of 1945. By the end of 1945, monthly shipments had declined to a rate of only \$25,000,000. Sales for 1946 were conservatively estimated at about \$250,000,000 as against \$195,000,000 in 1937, the best prewar year. They might go higher. Backlog for the industry at the end of 1945 stood at about \$170,000,000 of unfilled orders. Some companies had nine to ten months' orders on their books, but others could promise delivery in two to three months' time. As the year closed, production of machine tools in most plants was hampered by (1) a shortage of skilled help, particularly in engineering departments and drafting rooms, (2) an inadequate supply of castings, electric motors and ball and roller bearings, (3) shutdowns of industrial plants because of the prevailing labour situation, particularly in the Detroit, Mich., area, and (4) delays in financial arrangements to enable foreign customers to place orders for machine tools in the U.S.

The end of World War II with Japan brought a flood of cancellations of munitions contracts. In Aug. 1945, these cancellations in the U.S. totalled about \$23,000,000,000. This freed the metal-working industry for reconversion to the manufacture of goods for civilian consumption. Reconversion was rapid during the last quarter of 1945, it was not delayed materially by inability to secure needed production equipment as had been feared in some quarters. The worst bottlenecks were hard-to-obtain mechanical presses, conveying equipment, heating and drying ovens and plating equipment. Some builders of mechanical presses had, at the close of 1945, 15 months or more production booked, with about 40% of the press business coming from the automobile industry. Balance of the demand for presses came largely from canners, and from makers of stoves, washing machines and similar domestic appliances. Press brakes and shears were almost as hard to obtain as were mechanical presses. Backlogs of some press brake and shear manufacturers extended approximately eight months.

As had been expected, reconversion of many metal-working plants from war to civilian production brought immediate orders for large numbers of special-purpose machine tools. At the same time, there was a surprisingly large demand for standard general-purpose machines, such as lathes, milling machines, drill presses and planers. It had been expected that requirements for such standard units would, for some time, be met largely from stocks of such machines declared surplus by various agencies of the U.S. government. However, by the end of 1945 only about 60,000 of the approximately 650,000 tools owned by government agencies had been declared surplus. As 1945 ended, arrangements were being made to make it easier for industrial plants to acquire such machines and it was expected that during 1946 these surplus units would be an increasing threat to new machine tool sales. However, development of more efficient units by builders of machine tools would tend to make these general-purpose machines expensive to operate in a highly competitive economy and prospects for the machine tool industry might be brighter than many had forecast.

As was the case during each of the preceding war years, improvements in metal-working tools and processes received considerable attention throughout the year 1945. The milling of steel with carbide-tipped milling cutters having negative rake angles on the cutting edges continued to be a subject of intensive study by production executives in metal-working

plants, as well as by engineers employed by the manufacturers of milling machines and milling cutters. Several improved designs of such cutters were announced. Two of these new cutters employ solid blades of cemented carbide locked into place in slots in the body with wedge clamps. These blades are set at a positive radial rake angle, suitable for milling cast and malleable irons, aluminum, brass and other relatively easy to cut metals, and the cutting edges are ground off to provide narrow negative-rake lands when the cutters are to be used for milling steel. Cutting speeds and feeds are high when these cutters are used in suitable milling machines.

A new field of application for cemented carbides was announced during 1945. One supplier of these materials announced that conical sleeve bearings in which the mating surfaces were made of different grades of carbide had been installed successfully in the spindle of a high-speed tool post grinder where difficulties had been experienced with rapid wear of ball bearings. Because of an overload condition the ball bearings had been wearing out after a week or two of service; a set of the carbide-to-carbide conical bearings had been used for more than a year with only 0.000004 in. wear in that time. These bearings operate at 10,000 r.p.m. and are lubricated with a mixture of kerosene and colloidal graphite.

A centreless thread grinder, announced early in 1945, opened a new field of application for the high-production centreless grinding process. This machine uses a grinding wheel carrying multiple thread profiles formed by a cylindrical crusher with grooves in its periphery. The crusher is rolled against the grinding wheel with sufficient pressure to break down the bond of the abrasive, leaving the desired profile on the peripheral surface of the grinding wheel. This machine grinds accurate, smooth threads in hardened steel setscrew blanks in a single operation. Workpieces are fed between the grinding wheel and the regulating wheel one after another as in a cylindrical centreless grinder. Feed can be by hand or by means of an automatic loader.

The crusher method of dressing wheels for thread and form grinders received considerable attention during 1945. One manufacturer of precision grinding equipment announced an electrically powered crush dressing device suitable for application to new or old machines. These power crushing devices have advantages over manual crushing, including reduction of wheel dressing time by as much as 50% and increased life of the crusher roll due to the uniformity of crushing and smoothness of infeed. More parts are claimed per dressing because the wheel is always formed under identical conditions of infeed and pressure.

Of especial interest to production executives in mass-production plants, particularly in the automotive field, was the announcement early in 1945 of the development of a new method for rough and semifinish cutting the teeth in spur and helical gears up to 4-in. diameter and 2-in. face width. This machine operates on the gear shaper principle, but employs a cutter head in which individual blades simultaneously cut each tooth of the gear. After each vertical stroke of the cutter an internal cone is adjusted to move the blades inward a predetermined distance for the next cut. As many as 60 to 100 or more gears are cut per hour. These machines can be used in conjunction with high-production gear shaving machines for the manufacture of automotive transmission gears required in large quantities. (See also AUTOMOBILE INDUSTRY IN RECONVERSION.)

FILMS.—*Machine Maker; Simple Machines* (Encyclopædia Britannica Films Inc.). (B. C. B.)

**Mackensen, August von** (1849–1945), German field marshal, was born Dec. 6, in Haus Leiptnitz, Saxony. For his earlier career, see *Encyclo-*

*pædia Britannica*. Von Mackensen was one of the leading German generals of World War I and had to his credit victories over the Allies in battles in Russia, Central Europe and the Balkans. Although he had gone into retirement after the armistice, Hitler persuaded him to don again his famous death's head Hussar uniform and paraded him at nazi demonstrations as an historic "showpiece" symbolizing the fusion of the old and new Germany. Von Mackensen under the fuehrer's rule accepted the post of state counsellor in 1933. Also joining the ranks of the nazis were his two sons, Eberhard, who became a *wehrmacht* general, and Hans-Georg Viktor, a member of the diplomatic corps. Field Marshal von Mackensen, still in his faded old uniform, was captured in mid-April 1945 by U.S. troops. He died at Celle, Germany, in the British occupation zone, Nov. 8.

**Mackenzie King, William Lyon:** *see* KING, WILLIAM LYON MACKENZIE.

**McNarney, Joseph Taggart** (1893- ), U.S. army officer, was born Aug. 28 in Emporium, Pa. He was graduated from the U.S. Military academy, West Point, N.Y. (1915), and served with the U.S. air forces in France, 1917-18. He was graduated in 1926 from the Command and General Staff school at Fort Leavenworth. In March 1939 he was with the war plans division of the war department general staff; in Aug. 1940, McNarney was made a member of the Joint Defense board for Canada and the United States; and he served as a member of the special observers group in London, May-Dec. 1941. He was a member of the Roberts commission that investigated the Pearl Harbor attack (Dec. 1941-Jan. 1942), and in March 1942 he was appointed deputy chief of staff, the youngest officer ever to hold that position; in May of the same year he was made a lieutenant general. McNarney left his desk job in Oct. 1944 to become deputy supreme Allied commander in the Mediterranean. Pres. Roosevelt named McNarney (March 13, 1945) for promotion to the temporary rank of a full general. When Gen. Eisenhower was elevated to the post of chief of staff, McNarney succeeded him as commander of U.S. forces in Europe (Nov. 20) and concurrently of German occupation forces and U.S. representative on the control council. He said (Nov. 27) that he would adhere to a strict de-nazification policy, and predicted that the occupation of Germany would last 10 years or more.

**McNutt, Paul Vories** (1891- ), U.S. politician and government official, was born July 19 in Franklin, Ind. Educated at Indiana university, Bloomington, Ind. (A.B., 1913), and at Harvard, Cambridge, Mass. (LL.B., 1916), he served on the faculty at Indiana university law school, 1917-25, and was dean of the law school, 1925-33. He became governor of Indiana in 1933. He was U.S. high commissioner to the Philippines, 1937-39, and was named first administrator of the Federal Security administration in 1939. On April 18, 1942, President Roosevelt made McNutt head of the War Manpower commission. In an effort to correct "wastage" of federal manpower and the pirating or hoarding of workers, Pres. Roosevelt on Dec. 5, 1942, vested in McNutt full authority to hire and distribute workers for civilian war industries and full control of the Selective Service system. In Dec. 1943 a new draft bill was enacted which deprived McNutt of his power over selective service. On March 23, 1945, McNutt suggested that independence for the Philippines be deferred until the commonwealth recovered from the dislocation caused by the war. President Truman appointed him high commissioner to the Philippines on Sept. 6.

**Madagascar:** *see* FRENCH COLONIAL EMPIRE.

**Magazines and Periodicals:** *see* NEWSPAPERS AND MAGAZINES.

**Magnesia.** Formerly produced from crude magnesite, *magnesia* is now derived from a variety of raw materials—magnesite, bruceite, dolomite, sea-water bitterns, raw sea water, dry-lake brines and well brines. Productions in the United States of 191,792 short tons of caustic-calcined *magnesia* and 301,382 tons of refractory *magnesia* in 1943 (total 493,174 tons) dropped to 139,243 tons of caustic-calcined and 278,490 tons of refractory in 1944 (total 417,733 tons). Most of the decrease in caustic-calcined *magnesia* followed the cutback in *magnesia* production, while demand for the refractory grades suffered less.

The production of other *magnesia* compounds, mostly the chloride, sulphate and precipitated carbonate, derived in general from the same sources as the *magnesia* output, dropped from 726,513 tons in 1943 to 608,151 tons in 1944. Practically all of the decrease was in chloride, which is used for the production of the metal. (G. A. Ro.)

**Magnesium.** Under pressure of extraordinary World War II demand, *magnesium* production made a record that is an outstanding example of what can be accomplished when necessity drives. The progress of the industry in the United States is shown in the table.

Data of Magnesium Industry in the U.S., 1940-44  
(In thousands of short tons)

	1940	1941	1942	1943	1944
Primary output . . . . .	6.3	16.3	49.0	183.6	157.1
Secondary recovery . . . . .	?	?	6.3	11.4	14.2
Sales, primary . . . . .	6.4	15.5	47.4	170.3	146.6
Exports . . . . .	0.8	1.5	4.0	35.6	21.0
World output (est.) . . . . .	49.5	85.5	141.6	297.4	259.7

In the course of only three years *magnesium* shifted from a minor metal to a major one, with a plant capacity in the United States alone that totalled 293,000 tons. In 1940 the metal had been developed little beyond the experimental stage. Some of the war uses were expected to be made the basis of future civilian uses, but the problem of disposal of plant capacity of this magnitude appeared to be a difficult one.

Canada built up a small war production, amounting to 3,577 short tons in 1943 and increasing to 5,290 tons in 1944.

(G. A. Ro.)

**Maher Pasha, Ahmed** (1888-1945), Egyptian jurist and politician, was educated at the Khedivial Law school and Montpellier university, France. A brother of Aly Maher, who had been premier of Egypt, Ahmed Maher occupied a number of important government positions from the early 1920s. Early in his career, Ahmed Maher was strongly nationalistic but subsequently tempered his politics. His advocacy of moderation brought down upon him the wrath of the Wafd, the major Egyptian political party, and he was expelled from the party in 1938. After his expulsion, he became leader of the Saadists, a new political group composed of dissident Wafdists, and was minister of finance in the Egyptian government, 1938-40. At the outbreak of World War II, Ahmed Maher advocated Egypt's entry into the war on Britain's side, a course of action violently opposed by the Wafd. On Oct. 9, 1944, he became premier, succeeding Mustafa Nahas Pasha, and initiated a program calling for restoration of free elections, furtherance of plans for an Arab union and collaboration with Great Britain. On Feb. 24, a few minutes after he had read to the chamber of deputies a royal decree declaring

war on Germany and Japan, Ahmed Maher was shot and killed by a young Egyptian extremist.

**Mail-Order Business:** see BUSINESS REVIEW.

**Maine.** The extreme northeastern state of the United States, admitted as the 23rd state in 1820, and popularly known as the "Pine Tree state." Land area 31,040 sq.mi.; water area 2,175 sq.mi.; pop. (1940) 847,226; rural 504,169; urban 343,057. Capital, Augusta (19,360). Other cities: Portland (73,643); Lewiston (38,598); Bangor (29,822). The U.S. bureau of the census officially estimated the population of the state at 793,600 on July 1, 1944.

**History.**—The state legislature met in regular session (Jan.—April, 1945), with George Barnes of Houlton as speaker of the house and George D. Varney of Kittery as president of the senate. Veterans' preference legislation and postwar public works plans were enacted. Horace A. Hildreth (R) took office as governor (1945-46 term). Five Republicans served in congress: Robert Hale, Margaret Chase Smith, Frank Fellows in the house; Wallace H. White, Jr. and Owen Brewster in the senate.

**Education.**—Teacher shortages continued to be serious during 1945. By closing nonessential units and issuing permits to partially qualified teachers, most of the essential units were kept open. The net enrollment in the public schools for the year 1943-44 was 152,788 compared with 156,591 for 1942-43. There were 5,703 teaching positions (1943-44) compared with 5,817 for the year 1942-43. Harry V. Gilson was commissioner of education in 1945.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—As of Sept. 30, 1945, there was a balance in the unemployment compensation fund of \$36,257,306, compared with \$29,501,394 a year previous. Net benefit payments (year ending Sept. 30, 1945) were \$805,391 compared with \$320,601 for the preceding year. Public assistance funds expended during the fiscal year ending June 30, 1945, totalled \$7,308,769, divided as follows: general relief \$725,332; old-age assistance \$5,134,189; aid to dependent children \$952,799; aid to blind \$293,772; miscellaneous \$202,677. The number of persons being assisted in Dec. 1945, was about the same as 1944.

Thirteen state institutions (correctional, insane hospitals, sanatoria) with their inmate populations as of Oct. 31, 1945, and appropriations for the 1945-46 fiscal year, were as follows: Augusta state hospital, Augusta, 1,516 inmates, \$663,000; Bangor state hospital, Bangor, 1,105 inmates, \$556,000; Pownal state school, Pownal, 1,085 inmates, \$465,000; Central Maine sanatorium, Fairfield, 160 inmates, \$275,000; Northern Maine sanatorium, Presque Isle, 83 inmates, \$145,000; Western Maine sanatorium, Hebron, 98 inmates, \$180,000; Maine state prison, Thomaston, 355 inmates, \$200,000; State Reformatory for Men, South Windham, 94 inmates, \$120,000; State Reformatory for Women, Skowhegan, 134 inmates, \$127,000; State School for Boys, South Portland, 152 inmates, \$140,000; State School for Girls, Hallowell, 139 inmates, \$140,000; Maine School for the Deaf, Portland, 104 inmates, \$61,425; State Military and Naval Children's home, Bath, 37 inmates, \$27,500. The total inmate population was 5,062; the total appropriation was \$3,099,925.

**Communications.**—The total mileage of the state's highways at the end of the year 1944 was 21,923. Total state highway department expenditures for the fiscal year ending June 30, 1945 (including bond interest of \$552,723 and bond retirement of \$1,774,000), were \$8,936,803.99. Steam railroad mileage in the state (1945) was 2,778 mi. During 1944 there were 198,717 registered motor vehicles in Maine, with 198,185 as of Nov. 1, 1945.

**Banking and Finance.**—During 1945 the Maine banking department (Homer E. Robinson, commissioner) supervised 32 savings banks with 2 branches, 30 trust companies with 61 branches and agencies, 32 loan and building associations. The assets of savings banks and trust companies as of Sept. 29, 1945, were \$457,589,646.43 with total deposits of \$413,652,428.08. Assets on Sept. 30, 1944, were \$389,272,920.23. The 32 loan and building associations had resources of \$25,954,647 as of Sept. 29, 1945. The 34 national banks in Maine reported to the comptroller of the currency total deposits of \$242,067,000 and total assets of \$262,183,000 as of June 30, 1945.

State receipts, expenditures, and bonded debt for the fiscal year ending June 30, 1945, were respectively: \$42,101,841; \$31,489,219; and \$19,052,500. For the year ended June 30, 1944, they were respectively: \$42,775,080; \$30,440,533; and \$20,991,500.

**Agriculture.**—Late snow and frosts caused severe damage to apple and blueberry crops.

Table I.—Leading Agricultural Products of Maine, 1945 and 1944

Crop	1945 (est.)	1944
Corn, bu. . . . .	600,000	640,000
Wheat, bu. . . . .	36,000	40,000
Oats, bu. . . . .	2,916,000	3,515,000
Barley, bu. . . . .	84,000	84,000
Buckwheat, bu. . . . .	93,000	120,000
Hay, short tons . . . . .	919,000	735,000
Potatoes, bu. . . . .	52,785,000	52,260,000
Apples, bu. . . . .	132,000	912,000
Beans (dry), tons . . . . .	1,700	1,900

**Manufacturing.**—The total value of manufactures (1939 census) was \$345,368,595. Total employment was 81,995, and wages paid \$82,026,503.

Table II.—Principal Industries of Maine, 1939 and 1937

Industry	1939	1937
Boot and shoe . . . . .	\$46,162,403	\$42,568,005
Cotton mill . . . . .	28,342,860	28,937,439
Woollen mill . . . . .	36,118,681	28,409,949
Pulp and paper . . . . .	25,370,932	28,890,516

**Mineral Production.**—The leading mineral products of Maine include slate, granite, clay (chiefly for bricks), sand, stone and gravel (the last three chiefly for highway construction), cement, lime, feldspar, mica and peat. Maine also produces tourmalines and other semiprecious stones. Mineral production was low on most items in 1945.

Table III.—Value of Principal Mineral Products of Maine, 1944, 1943, 1942

Product	1944	1943	1942
Clay products . . . . .	\$ 47,892	\$ 120,000	\$ 300,000
Feldspar (crude) . . . . .	80,732	41,652	53,143
Peat . . . . .	710,047	60,033	110,478
Sand and gravel . . . . .	733,503	733,503	800,147
Stone . . . . .	332,736	409,780	556,655
Miscellaneous . . . . .	932,131	1,284,761	1,306,044
			(E.F.D.)

**Maize:** see CORN.

**Malaya, British:** see FEDERATED MALAY STATES; STRAITS SETTLEMENTS; UNFEDERATED MALAY STATES.

**Malinovsky, Rodion Yakovlevich** (1898?- ), Russian army officer, was born in Odessa of peasant parents and was drafted in the tsarist army in World War I. He served in 1915 with one of the Russian brigades in France, fighting beside British and U.S. troops in the Amiens-Arras-Reims region. He was a corporal and machine gunner in 1917 when he joined the Russian revolutionaries who laid down their arms. Malinovsky left France for Russia to take part in the bolshevik revolt. He became an officer during the civil war, but later returned to Odessa. He was soon back in the army, however, and when World War II broke out, he held the rank of major general and was commander of the soviet 6th army. In 1941 Malinovsky was forced to abandon Dnepropetrovsk before the nazi advance; he later personally led the forces which recaptured the city. He beat off German attempts to relieve Stalingrad in 1942, dashing Hitler's hopes of rescuing his trapped 6th army, and was promoted to the rank of colonel general and elevated from command of an army to command of the south front. While commanding the 3rd Ukrainian army in 1943-44, Malinovsky (who was made a marshal, Sept. 10, 1944), evicted the Germans from the southern Ukraine. In 1944 his armies drove into Rumania and entered Hungary. Tolbukhin and Malinovsky captured Budapest by Feb. 1945, and by April the 3rd Ukrainian force had driven into Czechoslovakia. After the war in Europe, Malinovsky was sent to Siberia, where he commanded one of the Russian armies that invaded Japanese-held Manchuria, Aug. 1945. He later commanded a soviet occupation force in Manchuria.

**Malta:** see MEDITERRANEAN, BRITISH POSSESSIONS IN THE.

**Manchuria.** A large area including the three northeastern provinces of China, Fengtien, Kirin and Heilungkiang, in northeastern Asia, bounded N. and E. by soviet Siberia, W. by soviet Siberia, Outer Mongolia and China, S.E. by Korea. Area, 503,143 sq.mi.; pop. (1940) 43,233,954; (1939) 39,454,026, including 642,300 Japanese, 1,162,000 Koreans and 1,035,525 Mongols.

The largest cities (Dec. 1940) were Mukden (1,135,801), Harbin (661,984), Hsinking (formerly Changchun) (544,202), Antung (315,242). The principal religions of Manchuria, in the order of numbers of believers, were Buddhism, Taoism, Lama-

ism, Mohammedanism and Christianity. In 1931 there were about 130,000 Roman Catholics and 125,000 Christians of other denominations.

**History and Government.**—Chinese sovereignty over Manchuria was interrupted when the Japanese army launched a surprise attack against Mukden, seat of Chinese administration, on Sept. 18, 1931. Chinese resistance was weak and disorganized, and Japanese military occupation was extended to the whole country and also to the neighbouring province of Jehol. A separate state was set up under Japanese sponsorship and finally assumed the form of an empire with Henry Pu Yi, a descendant of the Chinese Manchu imperial family, installed as emperor under the name of Kangte.

The new state received the name "Manchoukuo." It was never recognized by China, by the United States or by Great Britain. For some years Japan was the only large power which granted diplomatic recognition; but Germany, Italy and various axis satellite countries later opened up diplomatic relations with the new regime.

The government organization was a transparent screen for Japanese control. The commander in chief of the Japanese army of occupation was always ambassador in the new capital, Hsinking. There was no representative legislative body. A state council was the principal executive organ.

The Japanese hold on Manchuria was broken when the soviet union attacked Japan on Aug. 8, 1945, and overran the country rapidly, apparently in the face of weak resistance. Japan indicated willingness to surrender unconditionally to the United Nations on Aug. 14 of that year. It had been a decision at the Cairo conference of President Roosevelt, Prime Minister Churchill and Generalissimo Chiang Kai-shek in 1943 that Manchuria should revert to Chinese possession.

This decision was affirmed in a treaty concluded between the soviet and Chinese governments in Aug. 1945. This treaty provided that Chinese sovereignty was to prevail in Manchuria, while important economic concessions were to be made to the soviet union. The railway network of Manchuria, which was considerably increased under Japanese occupation, was to be under a system of joint Soviet-Chinese operation. The soviet union was to enjoy the right of using Port Arthur, a Russian leased possession before the Russo-Japanese War of 1904-05, as a naval base and was assured preferential rights in Dairen, the largest Manchurian port.

Information about what happened in Manchuria under soviet occupation was very meagre up to the end of 1945. Immediately after the Japanese collapse, Chinese communist forces moved into the country and offered some resistance to the entrance of central government troops. However, Chinese nationalist authorities and troops were taking over the principal cities with Russian acquiescence in December. It was announced

at the Moscow conference in December that soviet troops would withdraw from Manchuria by Feb. 1, 1946, in accordance with an agreement with the nationalist government of China.

**Education.**—There were 15,877 primary schools, with 1,589,169 pupils in Manchuria in 1939. There were 238 middle schools, with 54,768 students; 40 normal schools, with about 8,000 students; and 13 institutions for higher education, with 3,820 students. Government expenditure on education in 1939 was 45,967,000 yuan.

**Finance.**—The yuan, unit of currency during the "Manchoukuo" period, was kept equivalent in value to the Japanese yen, pegged at 23.48 U.S. cents in Dec. 1941. No information was available on the new financial arrangements which presumably would follow the return of Manchuria to Chinese rule.

**Trade and Communication.**—Exports during the first nine months of 1940 were 544,629,000 yuan; imports were 1,397,715,000 yuan. There were about 6,710 mi. of railways in 1940 and about 30,000 mi. of highways, of which 13,000 mi. were suitable for motor traffic.

**Agricultural and Mineral Production.**—Manchuria's staple crop is the soybean, production varying from 130,000,000 to 210,000,000 bu. yearly. There were 1,683,000 cattle, 2,000,000 sheep, 1,250,000 goats and 2,000,000 horses in 1937. The country produced 685,000 tons of rice and 74,667 bales of cotton in 1940. Coal and low-grade iron are the principal minerals. The output of coal in 1939 was 19,000,000 tons. As a result of Japanese development Manchuria was in 1945 probably the richest industrial area of China. (W. H. CH.)

**Mandated Pacific Islands:** see PACIFIC ISLANDS, MANDATED.

**Mandates.** The mandates section of the League of Nations' secretariat kept available official and unofficial information up to date in 1945, and the mandates commission, though it did not meet, received the annual reports of administering powers.

But the organization for dealing with non-self-governing territories, which was to be set up by the United Nations charter of June 26, 1945, would bring the career of the existing mandates commission to a close. The moral and practical value of the league's experiment in colonial administration was proved up to the hilt. The key principle of trusteeship was incorporated in three chapters of the charter and extended to include more social

#### Mandated Territories

Territory	Area Sq. Mi.	Date of Mandate	Mandatory Power	Former Title	Former Administration
SOUTH-WEST AFRICA, including Caprivi Zipfel, formerly part of Bechuanaland protectorate	317,725	Dec. 17, 1920	Union of South Africa	German South-west Africa	German Empire
TOGO, comprising:					
(1) Togoland, i.e., western section, excluding the seaboard	13,040	July 20, 1922	Great Britain	Togo	German Empire
(2) Togo, i.e., eastern section and seaboard	21,809		France		
CAMEROONS, comprising:					
(1) Cameroons adjoining Nigeria	34,081	July 20, 1922	Great Britain	Kamerun	German Empire
(2) Cameroons adjoining French Equatorial Africa	162,892		France		
TANGANYIKA	360,000	July 20, 1922	Great Britain	German East Africa	German Empire
RUANDA-URUNDI	20,115		Belgium		
PALESTINE	10,100	Sept. 29, 1923	Great Britain	Palestine	Ottoman Empire
TRANS-JORDAN	34,740		Great Britain	Part of the Vilayat of Syria	
*SYRIA AND LEBANON	77,062		France		
NEW GUINEA, TERRITORY OF, comprising:					
(1) Northeastern New Guinea (i.e. the northern section of southeast New Guinea)	93,000	Dec. 17, 1920	Commonwealth of Australia	Kaiser Wilhelm's Land	German Empire
(2) Bismarck Archipelago (New Britain, New Ireland, the Admiralty Isles, etc.)				Bismarck Archipelago	
(3) Certain of the Solomon Islands (Bougainville, Buka, etc.)				German Solomon Islands	
WESTERN SAMOA, comprising Savaii, Upolu, etc.	1,133	Dec. 17, 1920	New Zealand	German Samoan Islands	German Empire
NAURU	8	Dec. 17, 1920	British empire—Great Britain, New Zealand and Australia the present administrator	Nauru	German Empire
PACIFIC ISLANDS NORTH OF THE EQUATOR, comprising:					
(1) Marianas or Ladrone Islands (except Guam)	830	Dec. 17, 1920	Japan	No change	German Empire
(2) Caroline Islands, comprising the Eastern Carolines and Western Carolines, together with Yap Island and Palau					
(3) MARSHALL ISLANDS					

\*Syria and Lebanon were recognized by Great Britain and the Fighting French as independent republics in Sept. and Nov. 1941 and later, by all the great powers (see Syria and Lebanon). Their full independence was in 1945 only a question of time. Both countries took their places as original members of the United Nations at the San Francisco conference.

and economic obligations on the part of the administering states to dependent peoples. Negotiations between the states concerned for the transfer of mandated territories to the United Nations' trusteeship council were in hand. The council would have wider powers than the mandates commission, although certain areas of "strategic importance" in these territories would be outside its authority. Details of transfer from the league system to that of the United Nations were to be settled in 1946.

(See also NEW GUINEA.)

(M. FE.)

**Manganese.** There were in 1945 still many gaps in production data from the smaller producers, so that any total for world output could not be shown, but data from the more important producers were fairly complete.

Table I.—World Production of Manganese Ore, 1939–44

	(In thousands of short tons)					
	1939	1940	1941	1942	1943	1944
Brazil . . . . .	284.7	345.5	482.2	337.5	303.8	162.0
Chile . . . . .	13.8	12.8	39.5	78.6	125.8	?
Cuba . . . . .	112.9	132.2	277.1	274.8	343.0	284.3
Gold Coast . . . . .	427.8	488.3	549.4	761.7	589.1	565.0
India . . . . .	946.0	973.2	879.5	847.7	?	?
South Africa . . . . .	608.1	454.3	491.5	434.8	241.5	?
U.S.S.R. . . . .	?	3,086	2,638	2,000	?	508
United States . . . . .	32.8	44.9	87.8	190.7	205.2	247.6
Total . . . . .	5,698	?	?	?	?	?

**United States.**—Manganese production during World War II was a repetition of the experience of World War I. Output was materially increased above the peacetime level, but reached only a small fraction of the demand, as shown in Table II.

Table II.—Data of Manganese Industry in the U.S., 1940–44

	(In thousands of short tons)				
	1940	1941	1942	1943	1944
Mine shipments . . . . .	44.9	87.8	190.7	205.2	247.6
Metallurgical ore . . . . .	30.4	73.9	178.0	195.1	241.2
Battery ore . . . . .	10.4	11.4	12.4	10.0	6.2
Imports . . . . .	1,435.9	1,714.6	1,583.0	1,511.6	1,315.5
Brazil . . . . .	188.4	353.9	326.5	373.4	197.4
Cuba . . . . .	146.3	272.6	156.3	211.8	467.1
Gold Coast . . . . .	276.6	222.8	189.3	217.0	160.0
India . . . . .	212.2	433.3	600.8	462.9	346.8
South Africa . . . . .	199.1	306.6	234.2	127.7	41.4
U.S.S.R. . . . .	319.2	32.7	17.8	4.6	?
Consumption . . . . .	?	1,310.5	1,481.7	1,588.3	1,593.1

It was not considered likely that postwar consumption would exceed 1,000,000 tons annually, but in the cutback, it was possible that some of the war operations might be able to compete in the postwar market on a price and specification basis. Since most of the ore reserves are of low grade, it seemed likely that the program of experimentation inaugurated during World War II to promote better utilization of low-grade ore might be continued as a peacetime program.

(G. A. Ro.)

**Manitoba.** Central province of Canada and centre of continental America; established in 1870; area 246,512 sq.mi. (26,789 sq.mi. water); pop. (1941 census) 729,744 (6.3% of Canadian population); urban 44%; Canadian-born 73%; density 3.32 per sq.mi.; 59% had always lived in the province. Capital, Winnipeg, incorporated in 1873 (221,960). Other cities are St. Boniface (18,157), centre of culture for Canadians of French origin west of Quebec, Brandon (17,383), Portage la Prairie (7,187) and Flin Flon (6,860) (municipal district), mining and smelting centre of the north.

**History.**—The 21st legislative assembly was elected on Oct. 15, 1945, and the coalition group under the premiership of Stewart Sinclair Garson re-elected with 43 supporters of the 55 members. For the life of the next assembly the three armed services were to be represented by one candidate each, elected by ballot from service voters of Manitoba in Canada and overseas.

**Education.**—Pupils in public school grades in 1944 numbered

119,074. Correspondence students of the government branch totalled 1,990. Public school teachers were 4,354. Dr. A. W. Trueman of New Brunswick was appointed president of the Manitoba university on Aug. 1, succeeding Dr. Sidney E. Smith. Dr. H. P. Armes was appointed to a new position, dean of the university and assistant to the president. United college presented a \$1,500,000 building expansion program. The legislature at its 1945 session approved an act to provide for larger school units. The government appointed a royal commission on adult education, the chairman being Dr. Trueman and the other members being Dr. H. A. Innes of Toronto university, John Grierson, formerly head of the National Film board, J. J. Deutsch, economist with the *Manitoba Free Press*, and Frances I. McKay, director of women's work, extension service of the department of agriculture.

**Public Health.**—The government introduced a health plan in form to be integrated into a national health program and providing: (1) health units, (2) medical care, (3) hospital care, (4) diagnostic services, its operation equalizing medical resources on a province-wide basis.

**Communication.**—Manitoba is served by main trans-Canada railway lines and branches of the Canadian National and Canadian Pacific railways. Hudson's Bay railway from The Pas to Churchill provides transportation to Manitoba's ocean port and was an important link for defense during World War II. The Greater Winnipeg Water District railway parallels the Shoal lake water supply from the Lake of the Woods. Stevenson's field airport is the centre for all air line service of the region. All-weather provincial highways totalled 8,300 mi. in 1945. The government-owned telephone system, with 95,631 subscriber stations, operated two radio stations—one of 15,000 watts at Winnipeg (CKY) and one of 1,000 watts at Brandon (CKX). One privately-owned station (CKRC) operated with 1,000 watts and maintained two short-wave transmitters (CKRO and CKRX).

**Finance.**—The eight Canadian banks have their western headquarters in Winnipeg, and clearings for the year 1945 totalled \$4,335,003,611. Government revenue for the fiscal year ending April 30, 1944, amounted to \$20,050,000, expenditures \$18,567,000, which included an additional \$1,250,000 to postwar reserve, and a new insurance fund allocation of \$500,000. Public debt reduction in the previous three and one-half years totalled \$9,500,000.

**Agriculture.**—The gross agricultural production totalled (est. 1945) \$215,000,000, a slight reduction from 1944.

**Manufacturing, Minerals, Fisheries, Furs.**—Manufactures for 1944 were estimated by the Industrial Development board at \$350,000,000; minerals (1944) \$13,728,126; fisheries, production 27,293,100 lb. with value to fishermen of \$2,511,035 and marketed \$3,228,099 (1945); furs (1944–45), wild catch \$3,788,758, farms \$933,800, processed in Winnipeg \$1,591,812, exported from Manitoba (incl. other provinces) \$8,883,775.

FILMS.—*Prairie Provinces* (Encyclopædia Britannica Films Inc.).

(J. L. J.)

**Mannerheim, Carl Gustav Emil von** (1867– ), Finnish army officer, was born June 4 at Louhisaari, Finland. He studied at Russian military schools, the Hamina Cadet school and the Nikolaev Cavalry school in St. Petersburg. During World War I Mannerheim served with the tsarist armies. At the outbreak of the revolution, 1917, he left his command and returned to Finland, then in the throes of civil war. Mannerheim was made commander in chief of the white army and, enlisting German aid, he quelled Finnish and Russian communists. On Dec. 12, 1918, he became regent of Finland and held this office until

the establishment of a republic in June 1919. He then retired from public life, but was recalled in 1931 to head the Finnish council of defense. He reorganized Finland's armies, planned the Mannerheim line of fortifications strung across the Karelian isthmus and was made a field marshal in 1933. He led the Finnish troops in the war against Russia, 1939-40, and continued as supreme commander of Finland's armies when his country joined Germany in the war against Russia, June 22, 1941. On Aug. 1, 1944, Mannerheim was made president with authority to negotiate an armistice with Russia. The Finnish radio quoted Mannerheim as asking Finland, April 7, 1945, to "create lasting friendly relations with the soviet union." Reports were current in late 1945 that he intended to resign.

**Manpower, War:** see WAR MANPOWER COMMISSION.

**Manufacturers, National Association of:** see SOCIETIES AND ASSOCIATIONS.

**Maple Products.** The 1945 season was the poorest on record in the United States for the production of both sugar and syrup. The 1945 maple sugar production was estimated by the U.S. department of agriculture at 251,000 lb. compared with 565,000 lb. in 1944 and an average of 691,000 lb., 1934-43. This was only about 70% of the previous low production of 366,000 lb. in 1939. Syrup production was even less, 991,000 gal. in 1945 compared with 2,568,000 gal. in 1944 and an average of 2,612,000 gal., 1934-43.

Maple Trees Tapped and Syrup and Sugar Production, by States

State	Trees tapped		Sugar made, lb.		Syrup made, gal.	
	1945	1944	1945	1944	1945	1944
Vermont . . . .	3,111,000	3,496,000	147,000	314,000	351,000	944,000
New York . . . .	2,202,000	2,719,000	36,000	131,000	280,000	835,000
Ohio . . . . .	560,000	747,000	1,000	2,000	136,000	280,000
Michigan . . . .	474,000	515,000	3,000	6,000	82,000	167,000
Pennsylvania . .	285,000	364,000	18,000	28,000	53,000	133,000
Wisconsin . . . .	226,000	283,000	1,000	3,000	23,000	50,000
New Hampshire .	199,000	229,000	9,000	25,000	25,000	57,000
Massachusetts . .	157,000	182,000	20,000	30,000	22,000	60,000
Maine . . . . .	92,000	115,000	6,000	4,000	9,000	21,000
Maryland . . . .	30,000	31,000	10,000	22,000	10,000	21,000

This poor year was the result of the early warm weather in March that caused the sap to stop running much earlier than usual. Many producers were not prepared to begin operations at such an unusually early date; snow was still deep in the woods and labour was scarce. The number of trees tapped was 7,336,000 or about 15% below the previous year and much below the average. (J. C. Ms.)

**Marble:** see STONE.

**Margarine** (OLEOMARGARINE). The production of margarine in the United States showed little change in 1945, production being 591,000,000 lb. compared with 588,000,000 lb. in 1944 and a prewar average of 303,000,000 lb. in 1935-39. Civilian consumption increased slowly from 1931 when it averaged 1.8 lb. per capita to 3.9 lb. in 1945. The exports increased with the beginning of lend-lease in 1942 to about 80,000,000 lb. Relief agencies took about 13,000,000 lb. but the military requirements were small, amounting to only 2,800,000 lb. Domestic consumers showed little disposition to substitute margarine for butter even under the most severe rationing. The average price of margarine was about one-half that of butter. During 1945 the price of uncoloured margarine averaged 24.1 cents per pound compared with butter at 50 cents per pound. This price relationship had existed from the 1930s.

Some agitation to repeal the federal tax of 10 cents per pound on the coloured margarine continued without legislative action. Since margarine must be taxed, all wholesale and retail dealers must be federally licensed. In anticipation of a market when

butter became scarce and was severely rationed the number of licences increased sharply in 1942 and 1943 to about the same total number as in 1929 when many consumers were in distress.

The use of domestic vegetable oils in the manufacture of margarine greatly increased after 1940 because of the scarcity of foreign vegetable oils. At the same time the amounts of animal fats and oils declined slightly. The principal domestic oils used were cottonseed and soybean oils. The latter became of much greater importance after 1940. (J. C. Ms.)

**Marianas Islands.** An archipelago in the North Pacific, located from 12° to 21° N. and 145° E. With the exception of Guam, largest island in the group and a U.S. possession, the Marianas, together with the Carolines and the Marshalls, had been administered by Japan under a mandate from the League of Nations. Area (excluding Guam) 245 sq.mi.; pop. (June 30, 1939) 47,925. Saipan is the largest and most populous of the islands of this group under Japanese administration.

**History.**—Of the three groups of Japanese mandated islands, the Marianas are closest to Japan proper. So it was significant of the growth of U.S. naval and air power that this group was successfully invaded in June and July 1944. The landing on Saipan took place on June 15 and the Japanese sustained heavy losses in aeroplanes and warships in trying to relieve the island. The conquest was completed by July 9, with Japanese losses estimated at 11,500 dead, 58 ships and 900 planes. This was

A U.S. 7th ARMY AIR FORCE Liberator taking off from its base in the Marianas to raid Truk and other by-passed Japanese islands in May 1945

the first occasion when a Japanese population of any size came under United States administration. An internment camp was set up for the survivors. Saipan was subsequently transformed into a base from which B-29s took off for bombing attacks on Tokyo and other objectives in Japan. It was formerly a stopping point on the Japanese air line between Tokyo and Palau.

After the occupation of Saipan, U.S. forces took the neighbouring island of Tinian and reoccupied Guam. The remaining isolated Japanese garrisons in the Marianas, which held out on reserve stores and on what they could cultivate on the islands, laid down their arms after the Japanese surrender in Aug. 1945.

**Physical Features.**—The Marianas fall into two groups. There is a northern group of ten very small mainly volcanic islands of which only four are inhabited, while of the five southern islands—mainly of coralline limestone formation—Guam, Saipan, Tinian, Rota and Aguijan, only Aguijan is uninhabited. The highest elevation in the northern volcanic group is about 2,700 ft. The southern islands rise very little from the surface of the ocean. The climate is damp, the temperature even, the vegetation tropical and luxuriant. There are wild pigs and oxen. Products of the Marianas include coco-nuts, yams, sweet potatoes, manioc, coffee, cocoa, sugar, cotton, tobacco and mother-of-pearl.

**Industry and Education.**—There were more Japanese in the Marianas than in the Carolines and Marshalls taken together. Of the 18,990 Japanese households in the three groups of islands in June 1939, 10,716 were in the Marianas. This was partly because of the intensive development of the sugar industry. Sugar cane was grown on Saipan as far back as the 16th century. But before the Japanese administration there was no refinery and the natives ate the cane raw.

The amount of land under sugar cultivation increased from 50 ac. in 1913 to more than 15,000 ac. in 1933. There were 687,894 long tons of sugar raised in 1938. There are sugar refineries on Saipan, Tinian and Rota, under the ownership of the South Sea Development company, which was capitalized at 20,000,000 yen for the purpose of promoting the economic exploitation of the mandated islands. The value of the annual production of the principal industries in the mandated islands in 1938 was 27,702,567 yen, divided as follows among the industries:

Sugar .....	23,885,733 yen	Canned foods .....	662,508 yen
Alcohol .....	830,410 yen	Alcoholic drinks.....	528,588 yen
Syrup .....	763,649 yen		

The natives lead a simple tribal life under chiefs, whose former powers were greatly curbed by the German and Japanese administrations. The main functions of the chiefs are to collect taxes and transmit government orders to their people. They also perform ceremonial rites. The natives of the Marianas are partly of Kanaka, partly of Chamorro stock. Nature provides for most of their wants, as there is an abundant supply of coco-nuts, sweet potatoes, bananas, pineapples, mangoes. Staple native foods are fish, fruit and meat. There are schools for natives, at which attendance is voluntary, and there was compulsory six-year elementary schooling for Japanese.

(W. H. CH.)

**Marine Biology.** The application of the radar principle<sup>1</sup>, which proved valuable in World War II, promised to have wide application as an electronic navigator which could be used on all sorts of ocean-going craft as well as lake and river ships. Experimental sets, produced for testing purposes by a large manufacturing concern in the United States, were being used in 1945 by the maritime service and

as soon as materials were to be had in volume such equipment would be available for commercial shipping and for other purposes. It was said that obstacles may be detected by this device through darkness, fog and storm up to distances of 30 mi. There can be little doubt that the vessels devoted to the scientific exploration of the seas will take advantage of these developments.

Other attacks on fouling problems promised to be useful to the marine biologist whose technical equipment is subjected to prolonged exposure to sea water. The fouling of ships' bottoms<sup>2</sup>, which reduces their speed, curtails their use by dry-docking and involves tremendous costs in labour, fuel and money, is many sided. It was presented to the biologist and the chemist for solution. In a report issued by a joint anti-fouling subcommittee of the Iron and Steel institute and the British Iron and Steel federation, emphasis was placed upon research which would inhibit the exhaustion of the metallic constituents of paints by the cementlike formations largely of organic origin. It was concluded that several steps in this organic deposition contribute finally in producing a suitable media for organic life as such to make their attachments. It was suggested that any measure which would hinder deposition of lime salts by living organism would counteract fouling. Theoretically zeolite or sodium permutit, applied to the anticorrosive paint base, should prevent the catalytic action and inhibit the formation of gelatinous calcium carbonate.

Such anticatalytic action was observed in a limited way by the use of the new insecticide DDT (dichloro-diphenyl-trichloroethane). A worker at the Yaquina Bay Fisheries laboratory<sup>3</sup>, Oregon, was encouraged to believe from preliminary tests that fouling caused by at least one type of organism may be prevented when this ingredient is admixed with the usual anti-fouling paints. Remarkable resistance had already been achieved to *barnacle* attachment and studies were in progress to determine its efficiency for the control of other fouling marine forms. However, a note of caution was sounded by workers at Mellon institute<sup>4</sup>, Pittsburgh, Pa., since in their researches at Daytona Beach, Fla., the insecticide was ineffectual for the attachment of annelids, bryozoa, algae, hydroids and tunicates.

A report of a textile chemist at the University of Leeds<sup>5</sup>, Scotland, finds seaweeds (kelp) adapted to the production of high quality rayon. Since dry seaweed contains from 15%-40% alginic acid (a polymere of  $\alpha$ -mannuronic acid), this when treating with an alkali ( $\text{Na}_2\text{CO}_3$ ) forms an alginate rayon of excellent quality and appearance. Because of a relatively high metal content of alginate rayon, fabrics made from such yarns are noninflammable. Other properties permit a wide range of colours with basic dyes.

From the Biological Laboratory of Plymouth<sup>6</sup>, England came a report that the autotrophic flagellates and peridinians together constitute by far the larger portion of the oceanic phytoplankton. However, the peridinians are usually less abundant than the diatoms so that one may say the bulk of plankton is well accounted for by the flagellates. A report from the Bishop museum<sup>7</sup>, Hawaii, gives an interesting bit of life history which has been followed in a new species of shrimp belonging to the family Callinassidae; subgenus *Calliactites* (*Callianassa*) (*Calliachibea parva*). The scientist successfully hatched and studied its larval form. As an aftermath of the war in the Pacific<sup>8</sup> certain island birds may become extinct as viewed by two scientists who made a survey of Midway and

certain other islands. It was believed that the Laysan rail and the Laysan finch have probably become extinct, while many other birds have had their populations depleted severely and may become extinct from various conditions attendant upon war operations within these zones.

The president emeritus of the Woods Hole Marine Biological laboratory,<sup>9</sup> Massachusetts, brought into print a record of the history of that institution. In addition to the intimate information about the marine laboratory from its early beginnings, many interesting aspects of the two other scientific institutions there, the United States bureau of fisheries station and the Woods Hole Oceanographic institution, are included. This report gives ample proof that scientists can successfully co-operate in the management of an institution, free from outside control and devoid of provincialism. Its record of marine research is phenomenal and its co-operative management unique.

A monumental piece of work on algae<sup>10</sup> was brought out by the University Press, Cambridge, which should be of great value to the marine botanists. While the title suggests the volumes deal with structure and reproduction mainly, it includes some considerable taxonomy, ecology and physiology. Because of its completeness, it will no doubt serve as a valuable standard reference text. A captain, commander of the submarine squadron "TWO," reported a poster found on the Oceanographic Institute at Morosi Ko, on Sagami Wan, comparing it with Woods Hole, Mt. Desert, Tortugas, Pacific Grove, Puget Sound stations (U.S.) and suggesting that after the weapons of war were destroyed the university be notified so that the Japanese students might return to their scientific home. (See also ZOOLOGY.)

**Marine Corps.** On Nov. 10, 1775, the first continental congress by resolution provided for the marine corps as a part of the naval establishment for duty at sea and on shore. The strength has been kept normally at 20% of the naval personnel, the maximum reached in 1945 being about 500,000 officers and enlisted men. Enlisted men come from the selective service and from voluntary enlistment; officers are commissioned from graduates of the naval academy at Annapolis, Md., and distinguished military colleges, from selected enlisted men and civilians.

The basic mission of the marine corps is to aid the navy in accomplishing its mission which is to gain command of the sea and keep it. To do this the marine corps furnishes detachments aboard battleships, cruisers and carriers; maintains amphibious striking forces with the fleets; and provides garrisons at naval shore stations.

The organization and training provides infantry, artillery, aviation, paratroops, tanks and supply units.

Fleet marine forces are corps made up of triangular divisions armed, outfitted and trained for amphibious operations with the fleet or the task forces thereof as integral parts of the fleet.

The commandant of the marine corps in 1945 was General Alexander Archer Vandegrift who with administrative and operational staff was stationed at headquarters in the navy department, Washington, D.C.

The recruit training stations are at Parris Island, S.C., and San Diego, Calif.

Divisional training stations are at Camp Lejeune, New River, N.C., Camp Pendleton, Oceanside, Calif., and Quantico, Va., the marine corps schools being at the last named station. Aviation units are trained at these stations and with naval aviation ashore and afloat.

During 1945 marine forces under command of Lt. Gen. Holland M. Smith and Lt. Gen. Roy Geiger were engaged with the Pacific fleet of Admiral Chester W. Nimitz in attacks on Japanese islands, notably in the capture of Iwo Jima and Okinawa. Marines were also part of the occupying forces of Guam and other Pacific islands.

The marine corps was in 1945 being reduced from a maximum wartime strength of 500,000 to a peacetime strength of 100,000

U.S. MARINES, newly landed at Okinawa, hunt enemy snipers hidden in a burial vault near the town of Sobe. The town was taken within an hour of the first landings on April 1, 1945

and 8,000 officers. The six combat divisions were to be reduced to two, the first division with headquarters at New River, N.C., and the second division at Camp Pendleton near San Diego, Calif.

As of Dec. 1945 four divisions were assigned to police duty in Japan and north China and two divisions were in reserve. In the progressive reduction in strength 100,000 enlisted men and 10,000 men officers, 5,800 enlisted women and 300 women officers had been discharged.

**Marine Corps Women's Reserve.**—Congress in 1943 authorized the commissioning and enlistment of women in the reserve to replace men in suitable positions, thus releasing the men for active field duty. This organization in 1945 attained a maximum of 1,200 officers and 20,000 enlisted women under command of Colonel Ruth Cheney Streeter, with its training centre at Camp Lejeune, New River, N.C.

They were detailed to clerical and administrative work in offices at headquarters and other shore stations, to ground crews of marine aviation, to maintenance of trucks and motor cars and to supply depots. In the demobilization following World War II these women were being gradually discharged.

**Marriage and Divorce.** What was most significant in the history of marriage and the family in the United States during 1945 was also the most obvious. This was the disorganization that came as an aftermath of World War II. The stress revealed in domestic relationships so apparent before the close of the conflict was increased and was finding freer expression. The widespread disillusionment that followed World War I was again developing and seemed likely to be even more disturbing, as it showed itself in domestic life, than was true of the former experience. The causes were many. Imprudent, hasty marriages, marriages made because of ulterior motives such as desire for government allowances, passion marriages and marriages that had no proper start because of the hectic circumstances before the husband went overseas were revealing their inadequate foundations for a genuine life fellowship. Changes in affection, differences in maturity, the fading out of romance as a consequence of war conditions as they affected one or both spouses destroyed a compatibility which under normal circumstances would have been likely to prosper. The unfaithfulness of wives during the absence of their soldier husbands or the suspicion of this, often by men who helped other wives break their marriage vows, contributed its part to the disorganization of war marriages. The inability of the returned soldier to find suitable shelter for his family was one of the most troublesome of his domestic problems, often a serious handicap to the re-establishing of a genuine home life. In the background of all these troublemaking circumstances was the disillusionment associated with the transfer from the highly emotional expectations of the war period to the realistic social consequences of the costly conflict.

This disappointment created among many soldiers and their wives a restlessness, an underlying discontent that easily became disturbing of marriage association. If added to this feeling there was a belief that the husband was needlessly being held overseas there developed a situation which frequently expressed itself in letters that made trouble between the spouses. Wives were also writing more freely to their husbands concerning their dissatisfactions, no longer feeling that for patriotic reasons they ought not to talk of their troubles. Often these seemed selfish and trivial to men who endured genuine hardships.

Another disturbing influence came from the experience of women who went into war industries. They enjoyed an independence never realized before and in a great many instances also a standard of living far higher than that to which they had been accustomed. Many of them also came to prefer the gregarious industrial jobs over their former household tasks. Even when willing to return to housekeeping they were less happily adjusted and ill-prepared to help their husbands through the trying experience of reconverting to civilian life.

Divorces were increasing as was expected by those who knew that after World War I they reached the highest point in the history of the United States. Already exceeding that record before the close of World War II, it appeared that the divorce rate in the immediate postwar years would go still higher. One influence in addition to the disorganization previously mentioned was expected to be the economic independence and advance in standards of living of many wives who went into war industries. Some sociologists expected during postwar years there would be one divorce for every four marriages.

This increase in divorces was taking place wherever there was opportunity for marriage incompatibility to express itself legally. England, for example, was having a marked increase in requests for divorce. In 1914 there were only about 600; in 1945 in London alone, according to a statement of the archbishop of York, there were 4,000 cases waiting to be heard. His interest in salvaging marriages appeared in his statement according to the press that adultery must not necessarily be followed by divorce since it was often the result of great strain and temptation and did not mean a loss of affection.

In many countries, including the United States, a more determined effort was being made to increase the birth rate. On the other hand, there were social leaders who insisted that the atomic bomb made it necessary to give greater attention to the eugenic quality of the population, that the quantity of manpower was no longer significant as a means of national security since that can come only from high standards of intelligence, skill and humanity in the population.

The juvenile delinquency aspect of family disorganization was increasingly characteristic of 1945. During the first half of the year as compared with the same period in 1944 the arrest of boys under 21 years of age as reported by J. Edgar Hoover, director of the Federal Bureau of Investigation, increased 9.8%. The offenses of criminal homicide, rape and other felonious assaults increased in this age group 23.8%. Among girls under 21 years of age the total arrests decreased 5.4% but for offenses against property the increase was 9.2%. Perhaps what was most significant was the violent character of juvenile crime. It was generally felt that family conditions were by far the most important causes of this increasing problem of youth delinquents.

Progress was made during the year 1945 in activities that sought to strengthen and improve marriage and family life. An important contribution came from science through discoveries of the possible danger to the foetus of the Rh factor in human blood plasma, although there was no hopeful treatment except under certain conditions when the affected child is born alive. Another insight came from a study of more than 7,000,000 births by Dr. Jacob Yerushalmy, principal statistician of the United States public health service, who found that among mothers whose children were born neither too near together nor too far apart there were fewer born dead than was true of mothers who had their children close together or far apart. This investigation revealed that the lowest stillbirth rate was not found among the youngest mothers for it was relatively high between the ages of 15 and 19 years (33.7), but among those who maintained a moderate rest period between births, the ideal length of this interval not being determined. The maternal

death rate was the lowest in the recorded history of the United States, while in 1917 it was the highest. The emergency maternity and infant care program financed by federal funds for the wives of men in the four lowest grades of the armed services had an important part in this favourable situation. In the United States and in the Allied nations there was agitation directed toward increasing the birth rate. England, according to the White Paper issued by the government through the royal commission on population, tended toward small families, a condition which was assumed to be the result of the practice of birth control, which endangered the welfare, even the survival of the nation.

Progress was made during 1945 in educational efforts to conserve marriage and the family. Courses in preparation for marriage were well established in the U.S. college program. There was widespread recognition that similar instruction adapted to the needs and limitations of the younger adolescent should be developed in the high school program. There was, however, no agreement as to the content of such instruction, some insisting that sex education should be excluded since it is the obligation of the home while others saw no hope of young people getting this needed insight unless it is given by the school. Marriage counselling was being increasingly recognized as a professional service that is greatly needed. There were three types of counselling: one being developed by scientific specialists, another carried on by members of the ministry, priesthood, social workers and physicians, and the third was in the hands of persons who had no training but who by one means or another obtained publicity that drew ill-informed clients. Headway was being made in establishing and advancing the professional standards of the counselling specialist largely as a result of the influence of the American Association of Marriage Counselors.

There was greater recognition than ever before of the part law plays in the conserving of marriage and the family. Thirty-five of the 48 states and the territory of Hawaii all had some form of prenatal examination law requiring the examining physician to make a blood test for syphilis in expectant mothers. Thirty-two states and the same territory required premarital examination and blood test for syphilis before marriage licences could be issued. In Arkansas, South Carolina and Texas a prenatal examination law was considered but not passed. Arizona, Arkansas, Delaware, Kansas, Montana, Nevada, New Mexico, South Carolina, Texas and Washington were the states in which premarital examination legislation failed to pass.

The most disturbing divorce decision ever made by the United States supreme court (*Williams v. North Carolina*), came during the year when for a second time North Carolina appealed a divorce decree that had been given in Nevada to two of its citizens who went there for the six weeks' required residence. The contention of North Carolina that the six weeks' absence from the state did not constitute a genuine residence in Nevada since it was undertaken merely to obtain a divorce with the intention of then returning to North Carolina was upheld. As a consequence a great many similar migratory divorces had their validity thrown into doubt. In England a decision of equal legal significance was made by the British court of appeals annulling a 13-year marriage as unconsummated on the ground that the husband insisted on using contraceptives. North Carolina enacted legislation recognizing incurable insanity under certain conditions as grounds for divorce.

Although there were several regional conferences concerned with problems of domestic life, because of travel restrictions there were few national meetings. Early in 1945 at the Catholic University of America a Family Life conference was held and its proceedings published under the title, *The Family Faces Forward*. At the same institution the Foundation for Family Study

and Research was established under the direction of Rev. Edgar Schmiedeler. A program of graduate study in preparation for the teaching of marriage and family courses and for marriage counselling was inaugurated at the University of North Carolina. (See also CENSUS DATA, 1945.) (E. R. G.)

**Marriott, Sir John Arthur Ransome** (1859-1945), British historian, was educated at Repton and New college, Oxford. He became lecturer at the latter institution in 1884. He was a member of various government committees and a director of the Great Northern railway, 1919-23. Sir John was a Conservative member of parliament for Oxford City, 1917-22, and for York, 1923-29. An honorary fellow of Worcester college, Oxford, he was the author of many works on history and political science. Among them are *Makers of Modern Italy* (1889), revised in 1931, *The Remaking of Modern Europe* (1909), *English Political Institutions* (1910), *The Mechanism of the Modern State*, 2 vols. (1927), *Evolution of Modern Europe, 1453-1923* (1932), *Queen Victoria and Her Ministers* (1933), *Dictatorship and Democracy* (1935), *Life of Castlereagh* (1936), *Commonwealth or Anarchy* (1937), *This Realm of England* (1938), *The Evolution of the British Empire and Commonwealth* (1939), *The Tragedy of Europe* (1941), *A Short History of France* (1942) and *Federalism and the Problem of the Small State* (1943). Sir John, who was knighted in 1924, died at Llandrindod, Wales, June 7.

**Marshall, George Catlett** (1880- ), U.S. army chief of staff, was born at Uniontown, Pa., on Dec. 31. Commissioned second lieutenant of infantry Feb. 2, 1901, after completing his studies at Virginia Military institute, Lexington, Va., and the Army Staff college, he advanced through the grades to brigadier general in 1936. He was with the American expeditionary forces in France in 1917. He was stationed in China, 1924-27, and was appointed commander of the 8th infantry, 1933. In 1936 he was commanding general of the 5th brigade, and he was made chief of staff on Sept. 1, 1939, the day Hitler invaded Poland; Marshall was also appointed to the rank of full general. Tactful and sagacious, he displayed a rare talent for harmonizing diverse points of view and for retaining everyone's good will. An advocate of conscription, he directed and co-ordinated the enormous task of building up the U.S. army after enactment of the Selective Service bill. When war came, Dec. 7, 1941, his army consisted of only 1,500,000 men. By July 15, 1944, it had grown to 7,700,000, of which more than 4,000,000 were overseas. Marshall was promoted, Dec. 15, to the new five-star rank of general of the army.

Marshall advocated (June 16, 1945) universal peacetime military training, which he declared would tell the world "that we mean business," but would not imply lack of faith in world security. In the army report on Pearl Harbor, made public Aug. 29, he was charged with "failure in his relations with the Hawaiian department." However, both President Truman and Secretary of War Stimson took issue with this charge, and Stimson asserted that Marshall had acted with his "usual great skill, energy and efficiency." In his biennial report, issued Oct. 9, Marshall maintained that the only adequate defense a nation can have is to maintain the "power of attack" and urged establishment of a strong citizen army "to greatly strengthen the hand of the U.S. in securing a genuine organization to handle international differences." He also advocated a merger of the armed services (Oct. 18). Marshall relinquished his post as chief of staff to Gen. Eisenhower, Nov. 20. A week later (Nov. 27), he was named ambassador to China, replacing Maj. Gen. Patrick

Hurley. In Chungking, Marshall succeeded in bringing about a truce in the civil war between Chungking nationalists and the Chinese communists, Jan. 10, 1946.

**Marshall Islands.** An archipelago in the North Pacific, located between 4° and 15° N. and 161° and 174° E. It consists of a number of atolls arranged in two almost parallel lines running from northwest to southeast. Area (estimated) 160 sq.mi.; pop. (June 30, 1939) 10,684. Like the Caroline and Marianas archipelagos (*q.v.*) the Marshalls had been administered as a Japanese mandate under the League of Nations. The chief island and centre of administration is Jaluit. The Marshalls were the westernmost of Japan's island possessions in the Pacific and it is believed that they may have served as a take-off point for the attack on Pearl Harbor on Dec. 7, 1941.

**History.**—The Marshalls were the first Japanese territory to be invaded and partially occupied by U.S. forces. The invasion of the Marshalls began with the invasion of Kwajalein atoll on Feb. 1, 1944. Admiral Chester W. Nimitz announced that the authority of the Japanese emperor was suspended and that the invaded territory was under U.S. military law. Jaluit was one of a number of Japanese island strongholds which were by-passed during the U.S. advance. The isolated Japanese garrisons in the Marshalls laid down their arms after the Japanese government consented to surrender in Aug. 1945.

The Marshalls are the poorest and least developed of the three groups of Japanese mandated islands. The atolls are covered with sand, except in some places where a mixture of decayed vegetables has turned it into soil. Vegetation is sparse and the climate is moist and hot, with a mean temperature of 80.5°. There are few animals. The natives use as food some of the natural products of the islands: coconuts, breadfruit, taro, bananas, yams and pandanus seeds.

Like the other mandated islands, the Marshalls, until the beginning of World War II, were under the administration of the Nanyo Cho, or South Sea government, which was set up in 1922. The governor of the area was under the authority of the ministry of overseas affairs. Matters relating to communications were under the charge of the communications ministry and currency, banking and customs were subject to the control of the ministry of finance.

The government office was composed of the governor's secretariat and the two departments of home affairs and development. The department of home affairs contained sections for local affairs, finance, taxation and police and the department for development was composed of the five sections of agriculture and forestry, commerce and industry, fisheries, transportation and communications. The branch office of the government in the Marshalls was at Jaluit and had charge of such administrative affairs as policing, hygiene, tax collection, education, engineering and harbour construction.

**Communication.**—Although the Marshalls are off the main routes of world communication they enjoyed before World War II the services of the Japanese shipping company, Nippon Yusen Kaisha. It operated an East Round line, with Kobe and Jaluit as the terminal ports and calls at Saipan, Truk, Ponape and Kusaie. There were 19 voyages on this line every year.

**Education and Religion.**—There are schools for the natives on a basis of voluntary attendance and there was compulsory elementary six-year schooling for Japanese children. In 1939 there were 549 Japanese and 10,131 natives in the Marshalls. There is one Christian school in Jaluit.

**Production and Export.**—The chief export products of the Marshall Islands are copra, tortoise-shell, mother-of-pearl and sharks' fins. Between 3,000 and 4,000 ac. are planted with coco-

nut palms.

(W. H. CH.)

**Martinique:** *see* FRENCH COLONIAL EMPIRE.

**Maryland.** A south Atlantic state, according to the classification of the bureau of the census, but often classified as middle Atlantic. One of the 13 original states. Long known as the "Old Line state," latterly also as the "Free state." Total area 10,577 sq.mi.: land, 9,887 sq.mi.; water, 690 sq.mi. Population (1940) 1,821,244: urban, 1,080,351; rural, 740,893; white, 1,518,481 (foreign born, 81,715); nonwhite, 302,763. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 2,127,874. Capital, Annapolis (pop. 1940, 13,069); other cities: Baltimore (859,100), Cumberland (39,483), Hagerstown (32,491), Frederick (15,302) and Salisbury (13,313).

**History.**—Herbert R. O'Connor, Democrat, was re-elected governor in 1942 for a four-year term, which began on Jan. 13, 1943. The general assembly meets regularly in odd-numbered years. The regular session held in March of 1945 passed a motor vehicle financial responsibility act designed to encourage motorists to insure against accident liability. Millard E. Tydings, Democrat, re-elected to the United States senate in 1944, served continuously from 1927. The term of his colleague, George L. Radcliffe, Democrat, was to expire in 1947.

**Education.**—In 1944-45 there were in the state (including Baltimore whose schools are separately administered) 943 public elementary and occupational schools, with a total enrolment of 210,162 and a teaching staff of 5,561. There were 208 secondary and vocational schools, with an enrolment of 86,008 and a teaching staff of 3,482. In the elementary schools about one student in four was a Negro; in the higher schools about one student in seven was a Negro.

The Catholic school enrolment for the entire state was 46,975 white and 2,033 Negro with the total 49,008. The enrolment in non-Catholic private schools was 8,099 white and 75 Negro, with the total 8,174. The state superintendent of schools in 1945 was Dr. Thomas G. Pullen, Jr., whose four-year term of office was to expire in 1948.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—During June 1945, old-age assistance was extended to 11,556 persons (cost, fiscal year ending June 30, 1945, \$3,838,000); 438 needy blind persons were assisted (cost fiscal year, \$161,000); 2,875 families received assistance for the care of dependent children (cost, fiscal year, \$1,247,000). Unemployment compensation benefits paid during the fiscal year 1944-45 amounted to \$803,000. Those paid during the calendar year 1945 were reported as follows: prior to V-J day \$745,546; after V-J day \$8,921,926; total, \$9,667,472.

**Correctional institutions and the number of inmates on Oct. 16, 1945, were as follows:** Maryland penitentiary (1,202); Maryland house of correction (1,050); Maryland state reformatory for males (471); Maryland state reformatory for women (190). Four institutions were maintained for juvenile delinquents, white and Negro, girls and boys; total number of inmates, 768.

**Communication.**—During the fiscal year July 1, 1944, to June 30, 1945, the state roads commission expended \$12,213,929. The total mileage of roads in the state highway system was 4,419; in the county systems approximately 12,000; total 16,419. At the close of the year the total mileage of line-haul steam railroads was 1,368; of switching and terminal companies, 115; of electric railways (inter-urban), 71. The state aviation commission reported 24 licensed commercial airports, 3 licensed private airports and 8 military airports. As of Sept. 30, 1945, there were 292,117 telephone subscribers. The total number of instruments in use was 403,534.

**Banking and Finance.**—As of June 30, 1945, the state bank commissioner reported 111 state banks and trust companies with total deposits of \$938,868,259 and total resources of \$1,000,395,852 and ten mutual savings institutions with deposits of \$324,350,679 and resources of \$364,446,060. On the same date there were 63 national banks with deposits of \$785,527,000 and resources of \$830,674,000. The resources of all banking institutions, state and national in Maryland on June 30, 1945, totalled \$2,195,516,000. State appropriations for the year ending June 30, 1945, were \$50,259,067; expenditures, \$73,482,881; gross debt, \$25,098,000; net debt, \$22,327,079; general fund surplus, \$13,416,025.

**Agriculture.**—The farm value of the principal crops for the crop year 1944-45 was \$87,559,000 compared with \$107,146,000 for 1943-44. During the first 8 months of 1945, livestock and livestock products brought a total of \$66,785,000, as compared with \$66,182,000 during the corresponding period in 1944.

Table 1.—Leading Agricultural Products of Maryland, 1945 and 1944

	1945	1944		1945	1944
Barley, bu.	1,918,000	2,174,000	Potatoes, bu.	2,108,000	1,824,000
Corn, bu.	16,872,000	17,150,000	Tomatoes,		
Oats, bu.	960,000	1,170,000	market, bu.	832,000	1,152,000
Wheat, bu.	6,864,000	8,906,000	Tomatoes,		
Tame hay, tons	588,000	486,000	processing,		
Tobacco, lb.	21,600,000	32,160,000	tons . . .	119,000	330,000

**Manufacturing.**—For Aug. 1945, the Maryland commissioner of labour and statistics reported on 639 manufacturing establishments, employing

174,353 persons, whose combined weekly earnings were \$7,986,993; average weekly earnings in manufacturing industries, \$45.80; average hours worked per week, 44.8.

Mineral Production.—The latest figures available in 1945 on mineral production are shown in Table II.

Table II.—Leading Mineral Products of Maryland, 1944 and 1943

	1944	1943
Bituminous coal (net tons) . . . . .	1,875,804	1,933,380
Fire clay (net tons) . . . . .	81,605	142,309

Oysters.—The commercial catch of oysters in Maryland waters during the season 1944-45 totalled 2,436,133 bu. compared with 2,451,194 bu. during the season 1943-44. (E. GN.)

**Mascagni, Pietro** (1863-1945), Italian composer, was born Sept. 7, in Leghorn. His world-famous *Cavalleria Rusticana*, first produced in Rome in 1890, was an instantaneous success and launched a new school of musical writers known as the Italian verists. Most of Mascagni's later operas were, however, poorly received by audiences at home and abroad. He composed *L'amico Fritz* (1891), *I Rantzau* (1892), *Guglielmo Ratcliff* and *Silvano* (1895), *Zanetto* (1896) and *Iris* (1898), which ranked next to *Cavalleria* in popularity. In 1901, his opera *Le Maschere* was introduced in seven Italian cities at once; but the premieres were hissed at in five cities, stopped in one and won only a lukewarm reception in Rome. *Amica* was produced in Monte Carlo in 1905; later came *Isabeau* (1911), *Parisina* (1913), *Lodoletta* (1917), *Il Piccolo Marat* (1921) and his last opera *Nerone* (1935). The last two years of Mascagni's life were spent in seclusion in Rome, where he died Aug. 2. (See *Encyclopædia Britannica*.)

**Masella, Benedetto Aloisi** (? - ), Titular archbishop of Cesarea of Mauritania and apostolic nuncio to Brazil, was born at Pontecorvo, Italy, and entered the diplomatic service of the holy see as a young priest.

Although of Italian birth, Archbishop Masella is better known outside his native country, having spent 35 years of his priestly career in other lands. He served as chargé d'affaires to the Lisbon nunciature from 1910 to 1919, and was named nuncio to Chile in 1919, serving to 1927 when he was named apostolic nuncio to Brazil.

One of the senior papal diplomats, his excellency is held in high esteem in appreciation of a lengthy and brilliant career of service to the church.

He was nominated cardinal by Pius XII on Dec. 23, 1945, and was created and proclaimed a cardinal at consistory on Feb. 18, 1946.

**Masonic Fraternity.** While giving full recognition to the social services performed and supported by the fraternity, the enduring values of the real vitality of the craft are spiritual. The significance of the spiritual essence and ideals of Masonry is delicately high-lighted for 1945 in a scholarly paper entitled, "Freemasonry and the Idea of Natural Religion," which appeared in vol. 56, part I of the 1945 *Transactions* of the famous Quatuor Coronati Lodge of Research of London. The authors, Douglas Knoop and G. F. Jones, aimed in this paper to examine the historical context of the first charge in the celebrated Anderson constitutions of 1723, which charge is headed, "Concerning God and Religion." The subject is treated with heuristic skill, tact, fine discrimination and masterly impartiality. The paper is highly recommended to all Masons and should prove of much interest to the general reader.

With the termination of World War II in Europe the U.S. Masons were anxious to learn as quickly as possible the true condition of the craft in Europe. Accordingly, the Masonic Service Association of Washington appointed, by and with the

consent and approval of the president who is a Mason, a committee of four prominent Masons to visit Europe in August and September for the purpose of making a survey of the conditions of Masonry and Masons in Europe, as well as to make recommendations how U.S. Masons might and could help their brethren on the continent. One member of this committee was Dr. Charles H. Johnson, grand secretary of the grand lodge of New York. On Nov. 20, 1945, in an adjourned session of this grand lodge, Dr. Johnson read a concise report of the work and findings of this committee. The countries visited were England, France, Belgium, the Netherlands, Denmark, Norway, Sweden, Italy, Czechoslovakia, Finland and Greece. With the exception of Sweden, the destruction of Masonic buildings, property and records was appalling. The saddest story of all was the Netherlands'. The once beautiful grand lodge building in Amsterdam was a fire scarred shell. The grand master and the grand secretary were tortured.

The fine Masonic library, considered by many one of the best in the world, disappeared. Not even a Masonic apron was left. The situation was similar in Finland and Greece. Dr. Johnson expressed high admiration for the fortitude of the continental Masons and their cheerful determination to rebuild mainly by their own efforts and labours. This committee recommended that the Masons of the U.S. raise a fund of \$150,000 to be used for the benefit of the Masons of Europe. The grand lodge of New York agreed to contribute one-tenth of this amount, \$15,000. (E. R. CK.)

**Massachusetts.** A north Atlantic state of the U.S.A., admitted to the union Feb. 6, 1788. Known as the "Bay state." Area 8,257 sq.mi., including 350 sq.mi. of inland water; population (1940) 4,316,721 (1945 est., 4,493,281); population of principal cities (1945 est.), Boston 766,386; Cambridge 111,124; Fall River 115,062; Lowell 101,229; Lynn 105,153; Worcester 198,741; Springfield 159,896. Registered voters in 1945 totalled 2,320,081.

**History.**—The principal officers of the state in 1945 were: governor, Maurice J. Tobin (Dem.); lieutenant governor, Robert F. Bradford (Rep.); senator, Leverett Saltonstall (Rep.); secretary of state, Frederic W. Cook (Rep.); attorney general, Clarence A. Barnes (Rep.); treasurer, John E. Hurley (Dem.); auditor, Thomas J. Buckley (Dem.).

The 1945 session of the general court voted to pay the state's more than 500,000 veterans of World War II a \$100 cash bonus; voted \$15,000,000 for expansion of Logan International airport at East Boston, voted \$15,000,000 for development of the port of Boston and authorized establishment of a new port authority with sweeping powers. The legislature also approved a six-year highway program which was to cost approximately \$153,000,000. On recommendation of Governor Tobin the legislature set up a special recess commission to study the advisability of having a state department of commerce. This commission, headed by former ambassador to Great Britain, Joseph P. Kennedy, strongly recommended to the 1946 legislature that such a department be established with an initial annual appropriation of \$1,000,000. A distinguished committee headed by Governor Tobin and including Dr. Karl T. Compton, president of Massachusetts Institute of Technology, flew to London in Nov. 1945 to make a bid for selection of Boston as the permanent home of the United Nations organization.

The net direct debt of the state on July 1, 1945, first day of the state's fiscal year, was only \$4,593,775. The state's 39 cities and 312 towns were for the most part in strong financial condition, having built substantial surpluses during the war years when capital outlays could not be made. The combined debt of the state's cities and towns at the close of the 1944-45

fiscal year stood at approximately \$170,000,000. This was a drop of \$146,484,599 from the 1932 peak of \$316,484,599.

**Education.**—In 1945 Massachusetts communities maintained 1,771 elementary school buildings, with 34,403 pupils and 13,446 teachers; 177 junior high school buildings, with 86,734 pupils and 3,939 teachers; 276 senior high school buildings, with 128,370 pupils and 6,441 teachers.

The state department of education was headed by Commissioner Julius E. Warren. Under the general supervision of this department were nine teachers' colleges, located at Bridgewater, Framingham, Westfield, Salem, Worcester, Fitchburg, North Adams, Barnstable and Lowell; State College at Amherst; the Massachusetts School of Art, Boston; three textile schools at Fall River, Lowell and New Bedford; the Massachusetts Maritime academy at Hyannis.

Under the direction of the department of education facilities were provided at the teachers' colleges whereby veterans whose high school courses were interrupted by the war might complete them in schools where they would be associated with students nearer their own age.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—During the year ending June 30, 1945, the six major forms of relief operated by the state were: old age assistance, average number of cases 75,406, total payments of \$37,747,027; aid to dependent children, average number of children 17,443, total payments \$6,627,726; general relief, average cases 12,683, total payments \$4,918,539; child guardianship, average cases 8,037, total payments \$2,442,431; unemployment compensation, average cases 14,394, total payments \$2,699,099; aid to the blind, average cases 929, total payments \$485,612.

The five state correctional institutions in 1945 included the state prison at Charlestown; the Norfolk prison colony; the Concord reformatory (for men); the reformatory for women at Framingham; the state farm, Bridgewater. The 1945 legislature appropriated funds for the drafting of plans for a new state prison to replace the antiquated and often condemned institution at Charlestown.

Massachusetts became the first state to sponsor a blood plasma service for its residents. This program was being developed by the department of public health.

**Communications.**—Construction of highways was stopped by World War II, but in 1945 there were 23,516 mi. of highways of which more than 17,000 were rural. Railroad mileage in operation in 1945 was 4,200 including sidetracks and privately owned industrial track. There were 1,103,525 telephones in use in 1945.

**Banking and Finance.**—Of the 1,114 banking institutions as of June 30, 1945, 190 were savings banks, 184 co-operative, 66 trust companies and 459 credit unions. In addition there were 124 national banks and 26 federal savings and loan associations.

**Agriculture.**—Gross income of agriculture production in 1944 was \$156,585,000, of which \$53,171,000 was from crops, \$95,822,000 from livestock and \$5,592,000 from government payments.

Table I.—Leading Agricultural Products of Massachusetts, 1945 and 1944

Crop	1945	1944
Hay, tons . . . . .	588,000	412,000
Tobacco, lb. . . . .	8,460,000	9,381,000
Potatoes, bu. . . . .	2,788,000	3,120,000
Corn, bu. . . . .	1,634,000	1,763,000
Cranberries, bbl. . . . .	470,000	153,000
Crop acreage . . . . .	432,800	433,710
Total value, all crops . . . . .	\$39,901,000	\$35,593,000

**Fishing.**—In 1944 the produce of the Massachusetts fisheries was valued at \$50,000,000. For the second successive year Gloucester surpassed Boston in the number of pounds of fish landed. The Gloucester total was 188,661,349 lb., compared with 144,119,742 at Boston. New Bedford was the state's third largest fishing centre, with 74,935,719 lb. landed in 1944. The development of quick-freeze and the possible transportation of both fresh and frozen fish by air opened up vast new markets for Massachusetts fisheries, which were expected to boom in the immediate postwar period.

**Manufacturing.**—Value of products produced in Massachusetts factories and mills in 1943 was \$6,249,656,177 compared with \$2,753,147,104 in 1940, the last prewar year.

Table II.—Principal Industries of Massachusetts, 1943 and 1940

Industry	Value of products 1943	1940
Electrical machinery . . . . .	\$698,645,382	\$150,792,396
Woollen and worsted . . . . .	471,510,385	223,905,247
Boots and shoes (other than rubber) . . . . .	237,351,056	137,607,328
Cotton goods . . . . .	217,023,888	99,211,503
Foundry and machine shop products . . . . .	269,150,321	87,810,556

There were 8,630 industrial establishments in 1943 compared with 8,928 in 1940, and the wages paid all industrial workers totalled \$1,473,663,654 in 1943 compared with \$586,440,585 in 1940. The average number of wage earners employed in 1943 was 711,727 compared with 492,675 in 1940. (M. J. To.)

## Massachusetts Institute of Technology.

During 1945, the institute carried on war research and development work under 115 contracts, of which approximately 2% were with industrial firms and 98% with government agencies.

The institute's financial operations during its fiscal year 1944-45 totalled about \$50,000,000 as compared with prewar annual expenditures of about \$4,000,000. The war activities of the institute had required addition to its educational and research

plant of 450,000 sq.ft. of floor space by new construction and 260,000 sq.ft. by rental.

To meet conditions created by the war and to co-ordinate with the army and navy college training programs, the institute's academic program for all students remained on a three-term, year-round basis adopted in 1943. Total student enrolment in full-time professional courses fluctuated during the war years, and in 1945 was about two-thirds of the prewar normal. In addition, numerous units of army and navy personnel were assigned to the institute to take special short-term technical programs. New freshmen classes of approximately 600, the normal prewar quota, were admitted each year; to accommodate returning veterans, the freshman quota was increased to 900 for the immediate postwar years. (For statistics of enrolment, endowment, faculty members, etc., see UNIVERSITIES AND COLLEGES.)

see CANADIAN-U.S. WAR COMMITTEES.

**Mathematics.** The preoccupation of mathematicians with war work continued through most of 1945; the effects of the ending of World War II had hardly become noticeable before the end of the year. Although many mathematicians were released from war research, there had not been time for them to publish very much individual work. Others were still engaged in compiling definitive accounts of progress made in technical projects during the war and in revising for publication material which had formerly been confidential. Mathematical meetings were resumed and were well attended. A conference on mechanical methods of computation, held in Cambridge, Mass., in October, and attended by mathematicians from both sides of the Atlantic, attested to the interest in mechanized mathematics which had been stimulated by the necessity of obtaining numerical solutions of complicated problems. The first Canadian Mathematical congress was held in Montreal in June. The American Mathematical society's annual colloquium lectures were delivered by Tibor Rado (Theory of Length and Area).

With the end of World War II, publications from the European continent began to reach other countries more freely, and it became apparent that considerable mathematical work had been accomplished during the German occupation in Belgium, Denmark, France, the Netherlands and Norway. On the other hand, mathematical publication came to a complete standstill in Germany. By the end of the year 1945, mathematical research had been resumed in Poland, once one of the most mathematically active countries, though a large proportion of the prominent Polish mathematicians had died after 1939. A large number of mathematical publications continued to be received from Russia, where some fields of applied mathematics continued to be particularly active.

Few advanced mathematical books were published during the year. E. H. Neville's *Jacobian Elliptic Functions* (dated 1944) treated a classical subject, generally neglected, from a fresh point of view in an attempt to give it new life. J. E. Littlewood's *Lectures on the Theory of Functions* provided a highly individual treatment of special topics in the subject. *Mathematical Cuneiform Texts* by O. Neugebauer and A. Sachs was an outstanding contribution to the history of mathematics.

Considerable interest was attracted by developments in mathematical statistics. Many new results (particularly in the field of quality control) which had been confidential during the war, became available to the general mathematical public. Among individual papers which attracted notice in 1945 should be mentioned those (dating in part from 1944) in two different

branches of the theory of numbers: by L. J. Mordell and his associates in England (geometry of numbers); by U. Linnik in Russia (theory of prime numbers). Well known problems which had been open for several years were solved by P. R. Halmos (theory of measure-preserving transformations), R. P. Dilworth (theory of lattices) and R. Brauer (theory of group representations). Progress in the theory of groups of transformations was achieved by D. Montgomery and S. Bochner. A number of competing theories of the origin of the solar system attracted attention among students of mathematical astronomy (H. Alfvén, C. F. v. Weizsäcker, F. Hoyle).

**BIBLIOGRAPHY.**—A complete bibliography of papers in pure and applied mathematics is given in the abstracting journal *Mathematical Reviews*, vols. 6 and 7 (1945 and 1946). (R. P. Bo.)

**Meat.** The production of all meats in the United States in 1945 was estimated by the U.S. department of agriculture at 22,600,000,000 lb. which was slightly less than the record production of 24,648,000,000 lb. in 1944 but far above the average of 16,182,000,000 lb. for the prewar period 1935-39. The decrease was due to a reduced slaughter of hogs, calves and sheep. The total pig crop of 1945 was estimated at 86,987,000 or about 200,000 more than in 1944. The early part of this crop came to market in late months of the year but the total meat production was sustained by the larger cattle production of 1943 and 1944. Veal, lamb, mutton and pork began to decline in 1944 and this decline continued through 1945. Beef production increased 10% from 1944, veal declined 2%, lamb 1% and pork 22%. When the decline in hogs took effect meat supplies became tight, as 20% of the supply was taken by the armed forces and 5% for the Allies. Civilians consumed only 130 lb. of meat per capita compared with 150 lb. in 1944 and 126 lb. average 1935-39. The shrinkage from 1944 to 1945 became so acute in many localities as to encourage unofficial or "black" markets. The government set up slaughter quotas for noninspected slaughters and otherwise opposed the illegal practices. With the end of World War II military purchases were immediately curtailed and rationing discontinued. In late fall, however, set-aside orders were reinstated to get meat for the government relief agencies to ship abroad. Meat-animal production increased steadily after 1939 from a total of about 34,000,000,000 lb. live weight to the record of 46,300,000,000 lb. in 1943. The total then dropped to about 40,000,000,000 lb. in 1945. Most of this increase during the World War II period was due to the expansion of hog raising from about 17,000,000,000 lb. in 1940 to 25,500,000,000 lb. in 1943. The increase in beef was much smaller, from 15,100,000,000 lb. in 1939 to 19,000,000,000 lb. in 1944 due to the longer time required to raise the animals for market. The relatively large feed supplies on hand at the beginning of the war, together with the large crops of corn, made it possible to produce this great increase in meat to supply the war's demand.

The price of meats as a whole did not advance markedly during 1945, the average being less than in 1943. In the black market prices were unrecorded. Prices of meat animals as sold by farmers were only slightly above the level of 1944. The farmer's share of the consumer's dollar spent for meat was about 80% for beef, 59% for lamb and 77% for pork.

The goal for 1945 was set at 11,600,000,000 lb. of beef and veal, which with the expected production of 10,600,000,000 lb. pork and 820,000,000 lb. lamb and mutton would make about 150 lb. of meats per capita for total civilian consumption. The

TINS OF MEAT being prepared for shipment to Europe through U.N.R.R.A., at the Swift Canadian Company plant in Toronto, Canada

lamb and mutton goal was 20% below that of 1944 since the sheep industry had to be able to hold more breeding animals to check the decline that began in 1942. Beef production, on the other hand, might be increased since there were ample pas-

Livestock Slaughter in Plants under Federal Inspection (January to September, inc.), 1945 and 1944

	1945 head	1944 head
Hogs . . . . .	28,743,000	53,873,000

**Medical Association, American:** see AMERICAN MEDICAL ASSOCIATION.

**Medicine.** Striking in the medical advances of 1945 in the United States were discoveries related to the use of antibiotic drugs, new discoveries in chemical warfare against disease, outstanding research on nutrition and the glands and, finally, new surgical procedures for the saving of life in conditions formerly considered incurable.

**Antibiotics.**—The amazing virtues of streptomycin were established by its use in conditions not favourably affected by penicillin or tyrothricin. Apparently streptomycin is especially useful against infections with gram-negative germs like those that produce infection in the kidneys, so that Dr. Henry F. Helmholz of the Mayo clinic, Rochester, Minn., considered streptomycin the most important drug yet discovered for the treatment of infections of the kidney. Continued research showed also effectiveness in some cases of ulcerative colitis, tularaemia and undulant fever.

New uses for penicillin included its administration by mouth, requiring three to five times the dose as when the drug is given by injection. Effectiveness against gonorrhoea and infections in the nose and throat was established. Also new was the administration of penicillin by inhalation, using an especially built

vaporizer. Pastilles or lozenges made with penicillin were found useful in treatment of infections of the throat by germs sensitive to penicillin including the germ of Vincent's infection or trench mouth, septic sore throat and diphtheria.

Other antibiotics tested were a derivative of the *Bacillus subtilis* called subtilin, which was being tried in tuberculous infections. A similar product called bacitracin was found to be effective against the same germs that are affected by penicillin. Such antibiotics were much cheaper than either streptomycin or penicillin and would be useful particularly as wound dressings.

Finally, experiments continued toward the development of new antibiotics or other moulds such as *Aspergillus* yielding aspergillin, also clavacin and patulin, and the French announced an antibiotic derived from mushrooms.

**Chemical Warfare Against Disease.**—Among the new discoveries which attracted great attention in 1945 was tridione, a remedy especially effective against some forms of epilepsy and other convulsive disorders. Reports from several clinics confirmed its benefits.

Benadryl was reported useful in certain allergic manifestations such as asthma, urticaria, hay fever and food sensitivity.

Thiouracil was proved beneficial for the treatment of excessive activity of the thyroid gland as in hyperthyroidism, but apparently a high degree of sensitivity to the drug prevails. Such sensitivity is manifested by the temporary loss of the white blood cells. To protect users against infection investigators suggested simultaneous administration of penicillin.

A combination of undecylenic acid (2%), zinc undecylenate (20%) and ordinary talcum powder was proved the best preventive powder against the fungus infection commonly called athlete's foot.

An emulsion for eliminating lice and nits was developed including 5% isobornyl thiocanoacetate and six-tenths of 1% of dioctyl sodium sulfosuccinate. Tried on almost 1,500 people, it eliminated lice and nits completely in 90% with one application and in the remaining 10% with two applications.

The chemical warfare service of the government reported that a by-product of mustard gas which acted directly on basic tissues which produce white blood cells was capable of use against diseases like leukaemia and Hodgkin's disease in which there is an enormous increase of such cells. This product was still in an early experimental stage in 1945.

A new drug for "sick headache" somewhat like ergotamine tartrate was found useful in cases of migraine. While of a similar character, it was claimed to be less toxic.

Investigators reported that people with uncomplicated gastric ulcers were cured by being fed neutralized, filtered and preserved gastric juice of normal people. Another group of investigators reported success against gastric ulcer with feeding mixtures of the amino acids which are the basic constituents of proteins.

Curare, the South American snake poison, was developed as an extract in pure form, called intocostin and used to control muscle spasms in infantile paralysis and in spastic paralysis and also as a preliminary to anaesthesia in bringing about maximum relaxation before surgical operation.

**Biologic Remedies.**—A vaccine was developed against the virus A and B of influenza and was tried first by injection into 8,000,000 members of the United States army. Demonstration of its usefulness preceded release of the product for use by the public.

Vaccines consisting of killed germs were found effective in control of outbreaks of whooping cough.

The American Red Cross, which had previously purchased and distributed for free use by the U.S. public all of the gamma

globulin developed through the collection of blood at blood banks, followed the procedure by purchasing all of the surplus blood plasma also to be distributed through state health departments for use without cost by all of the people of the United States. The blood plasma purchased in 1945 was considered to be sufficient for two years. Co-operation of the American Red Cross with medical societies, hospitals and health departments provided for continuing the blood procurement centres under the auspices of the American Red Cross.

**Epidemiology.**—By the use of DDT in sprays and in widespread dissemination by the use of aeroplanes great areas were freed from the menace of the anopheles mosquito that carries malaria and from flies which are known to be carriers of various forms of infection.

Studies made by the health departments in Chicago, Ill., and by investigators of the University of Buffalo School of Medicine in Buffalo, N.Y., established the fact that infantile paralysis is spread in the vast majority of cases—more than 96%—by direct contact of the person who is infected with someone who carries the infection. Many cases of infantile paralysis never become paralyzed. In the Chicago epidemic only one out of six of those infected became paralyzed. Careful diagnosis and the use of spinal puncture establish the presence of infection. This proof indicated the uselessness of widespread campaigns against flies, mosquitoes and various insect vectors of disease as a means of controlling infantile paralysis.

Conspicuous among new infections becoming widespread in 1945 was infectious hepatitis formerly called chronic catarrhal jaundice. This condition can be transferred through the injection of infected blood and through contaminated drinking water as well as in other ways. Apparently the disease is caused by a virus. Gamma globulin injected in those who have been exposed prevents the development of the disease.

Investigations showed pigeons and other birds frequently to be carriers of a condition called ornithosis, similar to the disease called psittacosis or parrot fever and to atypical pneumonia. Epidemiologists felt that pigeons were not the direct cause of the spread of outbreaks of pneumonia but persons who care for pigeons are frequently infected with ornithosis.

**Surgery.**—A small percentage of babies are born with an anomalous condition of the heart and the circulation of the blood so that an adequate amount of blood does not go through the lungs and receive oxygen. These children become "blue babies." Drs. Alfred Blalock and Helen B. Taussig at Johns Hopkins Hospital, Baltimore, Md., developed a surgical technique for rerouting the blood so as to get a sufficient amount through the lungs. They operated on three children with severe degrees of cyanosis or blueness and brought the condition completely under control, permitting normal development. In the operation one of the large systemic arteries is connected to one of the large arteries that goes to the lungs. Cases were brought to Johns Hopkins from all over the United States—in some instances with funds raised by newspaper campaigns.

A new approach to the prostate gland adds a fourth technique to those already used for removal of this structure when it becomes enlarged or cancerous. The technique is called the retro-pubic extravesical technique, meaning that the approach is from the back of the lower portion of the body and that the operation stays outside the urinary bladder.

In operations on the gall bladder reconstruction of the tubes that carry the bile from the gall bladder to the intestines was improved by the use of artificial metal tubes of vitallium. The bile duct is reconstructed over the vitallium tube. After healing occurs, the tube passes on into the intestine and from there is passed out of the body.

In addition to blood banks where blood is stored in advance

for use against disease, banks were developed for keeping on hand under refrigeration the cornea of the eye and pieces of nerves that are used in nerve grafts. British surgeons also proposed the establishment of skin banks where skin can be kept for use in skin grafting.

War experience greatly improved surgery on the oesophagus. Operations were performed chiefly for cancer. Many surgeons reported mortalities under 20% whereas mortality in 1941 was more than 50%. Improvement in surgical technique was brought about by improvements in anaesthesia and in the technique of repair, also in preoperative and postoperative treatment.

New advances in plastic surgery emphasize flaps of skin taken from the neighbourhood of the defect and transplantation of skin from remote areas of the same person. A method was developed for tattooing skin grafts with pigments so that they blended with the surrounding skin. Refrigeration of skin grafts makes them available for a long time. Application of thrombin and fibrin foam derived from whole blood helps to promote the attachment of the skin graft to its new location. (See also SURGERY.)

**Vitamins.**—While new vitamins were not announced in 1945, new uses for old vitamins were frequently reported. A portion of the vitamin B complex, para-amino benzoic acid (called BAB) was found useful in the treatment of tsutsugamushi fever, also known as scrub typhus, which affected great numbers of U.S. soldiers in the orient.

A mixture of vitamins derived from the vitamin B complex was found useful in the treatment of diabetes because of the special virtues of these derivatives in oxidation of sugars.

The vitamin contents of many commonly used foods were carefully checked. Strawberries were found to have four times as much vitamin C as red raspberries and five times as much as blackberries. Beer was discovered in Great Britain to be a good source of nicotinic acid and British nutritionists said that a luncheon of bread, cheese, milk and beer together with water cress made a fairly balanced meal, at least as far as vitamins were concerned.

Folic acid, derived from the vitamin B complex, was reported to be deficient in the diet of patients with certain forms of anaemia in which the red blood cells do not develop properly.

Severe deficiencies of vitamin A in the diet cause changes in the cells on the outer surfaces of the skin, replacing the ordinary cells with hardened material of the type seen in fingernails and in calluses. Similar changes occur in the tissues of the eye and in the membranes lining the stomach, intestines and breathing tract. One of the factors of safety in the human body is demonstrated by the fact that the signs of vitamin A deficiency may be delayed by increasing the amount of vitamin B complex in the diet.

Physicians in a large lying-in hospital reported that the regular use of fairly large doses of vitamin E by women in the menopause helped to reduce the serious symptoms in a manner similar to that of the estrogenic hormones.

Vitamin C was also found to be important in the rate of healing of wounds so that healing was much slower in the presence of vitamin C deficiency.

Vitamin C seems to help maintain the level of the white blood cells and of the platelets in the blood. (See VITAMINS.)

**Cancer.**—Development of atomic energy was considered theoretically in relation to the control of cancer. By the use of atomic energy radioactive isotopes are prepared which can circulate directly to certain tissues of the body and carry radioactivity to these tissues. Thus radioactive iodine is carried to the thyroid gland; other radioactive substances to the liver or the spleen; still others directly to the bone marrow. Such radio-

PRODUCTS of fractionated human blood, stored in a cold-room at Harvard medical school. Already found useful for coagulation in surgery and as a control for shock, these products were explored in 1945 for further medical applications

activity can unfavourably affect the growth of cancer cells.

One of the new B vitamins, folic acid, was said to be active against spontaneous cancers in studies made on mice.

Surveys of cancer made in several large cities proved that great numbers of women die unnecessarily from cancer of the breast because of delay in coming to the attention of hospitals or clinics where competent surgical or radioactive treatment may be applied.

A grant of \$4,000,000 was given by Alfred Sloan and Charles Kettering of the General Motors corporation to establish the Sloan-Kettering Institute for Cancer Research in the Memorial hospital of New York city.

Control of cancer of the lung by surgery was greatly improved in 1945. Out of 75 cases of complete removal of the lung by surgery, 70 operations were done because of cancer. There were 21 deaths or a mortality of 30%, whereas formerly all would have been fatal.

All of the antibiotic remedies were tested against cancer and found to be without special benefit.

Cancer of the prostate gland and cancer of the testicle in man were apparently benefited by the giving of the female sex hormone. Similar experiments were tried in cancer of the breast and of the ovary in women, giving the male sex hormone.

A high degree of recovery in cancer of the throat by the use of radiation indicated great improvement in this method of treating cancer. Formerly, almost all such cases were considered fatal. The technique depends on special devices for administering radiation, on the proper selection of cases, and on the use of adequate amounts of radioactivity.

Cancer of the stomach, considered among the most fatal of all forms, was progressively overcome by utilizing new techniques for early diagnosis. Among 28 persons who were diagnosed as having cancer of the stomach and who refused operation, all were dead in three years. Among 141 people who had a diagnosis of cancer of the stomach with removal of portions of the stomach by operation, more than 27% were alive after

five years and almost 19% after eight years. (See also CANCER.)

**Venereal Diseases.**—Great progress was made in the control of syphilis by new methods of treatment using penicillin, bismuth, arsenical preparations and heat. Combined methods indicate the disease can be brought completely under control, certainly rendered noninfectious, in nine days. Gonorrhoea is cured completely in 24 hours in more than 98% of cases by injections every three hours of adequate amounts of penicillin.

For the first time complete elimination of venereal diseases, as typhoid fever and diphtheria have been controlled, appears possible. (See VENEREAL DISEASES.)

**Neuropsychiatry.**—New diagnostic techniques revealed neuropsychiatric cases as the maximum health problem in the post-war period. The Veterans' administration proposed to approach the problem by training great numbers of neuropsychiatrists and by the establishment of ambulatory diagnostic and therapeutic clinics. Methods of investigation included hypnosis and hypno-analysis of the causative factors, utilizing sedative drugs of the barbituric acid series, as well as active hypnotism, to put the patient into a mental state in which he reveals the causes of his mental disturbance.

**Roentgenology.**—Mass studies with the X-ray proved the usefulness of this method for determining the presence of tuberculosis. The value of the method was questioned because of a certain percentage of instances in which the diagnosis with the X-ray made a diagnosis of tuberculosis suggested but not certain. In the midwest portions of the United States apparently many people when young had a condition called histoplasmosis which leaves changes in the lungs which when observed by the X-ray seem to be those of tuberculosis.

The Nobel prize in medicine in 1945 was awarded to Sir Alexander Fleming, Sir Howard Walter Florey and Dr. Ernst B. Chain of Great Britain who did the fundamental work in developing the use of penicillin as an antibiotic remedy. (See also ALLERGY; ANAESTHESIA; BACTERIOLOGY; BIOCHEMISTRY;

**Military Medicine, U.S.**—More effective treatment of casualties from amphibious operations and further control of insect-borne diseases were the most notable advances in military medicine during 1945. Following large scale landings in continental Europe and later in New Guinea, the Philippines, Okinawa and other Pacific islands new techniques were developed that made it possible to provide satisfactory medical care as soon as the first troops secured the beach. Field medical personnel were attached to assault troops and followed them during the landing. Few medical supplies were taken, as it was found that when large amounts were allocated to the initial attack units, there were considerable losses of materials. Plasma, bandages, dressings, morphine syrettes, medicines and instruments that could be carried by hand were all that could be reasonably supplied to medical units during the early phases of the amphibious operation. When large amounts of plasma or whole blood were carried on stretchers from the boats to the aid stations, they were often lost in the surf. Medical officers found bags or haversacks useful in bringing up supplies of plasma. In favourable situations blood could be carried forward in the original containers.

Large stores of blood and plasma were invaluable aids in the initial treatment of casualties on the beaches. Universal donor blood or type "O" was most satisfactory, especially if it had an agglutination titre of less than 1 to 64. Troops and ships' complements were always willing to donate blood prior to combat, thus ensuring an adequate supply of fresh whole blood. In the U.S. three donor centres at Boston, New York and Washington provided about 1,000 pints of group "O" blood daily to the European fronts. Blood was collected, typed, processed and flown to Europe. A satisfactory preservative made it possible for blood to be safely used within 18 days after it had been taken from the donor. After processing, whole blood was chilled and packed in special expendable cartons so that it was properly refrigerated during its transit across the Atlantic. Similar arrangements were made in the Pacific areas and more than 500 pints of whole blood were flown daily from the west coast to army and navy units in the Pacific.

Improvements in surgery saved many lives and limbs in World War II. Wounded were returned as rapidly as possible to rear areas, where skilled surgeons were able to perform excellent surgery. Men were moved from the aid stations to division clearing stations as quickly as the situation would permit. At the clearing stations the wounded were examined and classified according to the urgency of their wounds (triage).

Seriously wounded, nontransportable cases were at once taken

AN INMATE of the Illinois state prison submitting to the bite of malaria-carrying mosquitoes. The Office of Scientific Research and Development sought a permanent cure to prevent recurring attacks of malaria. About 800 men in three prisons volunteered as human guinea pigs in 1945

to a special hospital—often a platoon or two of a field hospital augmented by a platoon of an auxiliary surgical group. Many serious chest, abdominal and head wounds were expertly treated at the earliest possible moment, practically at the front. A large number of wounded who would have died under older methods of evacuation and treatment were unquestionably saved.

Naval medical units utilized similar principles, with slight modifications. Casualties were given first aid by field medical units and were evacuated to ships as rapidly as possible. Small L.S.T. ships were most satisfactory for this, though frequently smaller craft had to be utilized, and at times rafts were improvised. Transfer of patients from small boats to larger vessels standing off shore raised perplexing problems. Litters were hoisted to the larger vessels. Rough weather and lack of personnel precluded the routine use of this type of evacuation. Some units found that a wooden ramp between the vessels expedited the transfer of patients, as they could be easily slid from the small boats to the larger craft. Hoisting small boats to the main rail deck ultimately proved to be the most satisfactory method of evacuating wounded.

Casualties were sorted and classified as soon as they were brought on the deck. Seriously wounded were taken to the operating room at once, and surgery was performed as soon as possible. Careful selection of the proper anaesthetic did much to permit the surgeon greater freedom of operation and to reduce mortality. Pentothal sodium was found invaluable for operations requiring little time, and it was used in more than half the cases. Spinal, inhalation and local anaesthetics were also used. Other wounded patients were sent to the shock, dressing, ambulatory, medical or observation wards for appropriate treatment. Transports or hospital ships left the combat area when a complement of wounded had been gathered, and departed for a fixed base, where reparative surgery could be done.

River crossings taxed the ingenuity of field medical officers charged with the evacuation of patients. Improvisations included the use of rubber rafts, or oil or gasoline drums filled with air lashed to rafts, and vehicles converted to crude ferries. A 500 lb. steel trailer was found to work well after a few adaptations.

**Infectious Hepatitis.**—Infectious hepatitis was a common disease of troops stationed in many parts of the world. It was shown to be a virus disease transmitted by water and believed to be excreted in the feces of patients with the disease. The disease was readily recognized by vague, early gastrointestinal symptoms, the appearance of jaundice, a tender liver and fever.

High carbohydrate diet, complete bed rest and transfusion of matched blood from donors who had recovered from the disease did much to reduce its seriousness. Intramuscular injections of gamma globulin were found to be useful in prevention. Treatment of water containing the virus with chlorine in the usual amounts (1 to 5 parts per 1,000,000) did not inactivate the disease-producing agent. Complete inactivation of the causative virus would require modification of the existing methods of water purification.

**Combat Fatigue.**—Combat fatigue was successfully treated in many forward hospitals. Very good results followed specific treatment for physical fatigue combined with individual treatment of anxiety symptoms. Group psychotherapy was successful when enthusiastic and understanding medical, nursing and hospital staffs were able to make the patients feel a part of the treatment group. Substitution of this new group for their combat organizations helped many patients regain what they had lost during the active fighting. After a few weeks' association with the hospital group, more than half the men voluntarily asked to be transferred to their former units.

Noncombatant psychiatric casualties were successfully treated

by group and occupational therapy, narcosynthesis, analysis and supportive measures. Neuropsychiatric examination of large numbers of men was aided by the use of recently devised questionnaires.

**Skin Diseases.**—Skin diseases were commonly responsible for considerable loss of manpower, especially in the tropics. The occurrence of skin disease depended on the housing, climatic and nutritional states of the troops, hygienic practices and contact with native populations. Scabies was a troublesome problem in Italy and France. Patients with scabies were given a hot bath, and the affected parts were scrubbed well. A 25% emulsion of benzyl benzoate was then applied with a paintbrush or spray gun to all parts of the body except the head. On the second day a second application was given, without a preparatory bath. Within one week more than 90% of all patients were cured. (See also ENTOMOLOGY; NURSING, WAR; PHYSICAL MEDICINE AND OCCUPATIONAL THERAPY FOR THE WOUNDED.)

## Mediterranean, British Possessions in the.

These comprise Cyprus, Gibraltar and the Maltese Islands, of which the accompanying table gives certain statistics. (See also BRITISH EMPIRE.)

**Cyprus.**—At the beginning of 1945 the government announced a development scheme on which at least £1,500,000 (£1=403.5 cents U.S.) from colonial funds would be spent. This included a water supply project to cost £500,000 (of which the government would pay half) to provide each of the 600 villages with piped water, and irrigation schemes costing £500,000 or more. A further £500,000 was to be devoted to a campaign against malaria and in establishing rural health centres. The department of agriculture set up an experimental farm for seed production and hoped to find a market in Britain for its vegetable and flower seeds. In July the government announced that it proposed to float a loan of £300,000 without interest, but with four-yearly drawings for prizes.

A plea for the cession of Cyprus to Greece was cabled to the Berlin conference by the Cyprus National party, the Pan-Cyprian Farmers' association and the pan-Cyprian Hellenic Socialist vanguard, and a similar plea was made in March by Ploutis Servas, general secretary of the Cyprus Progressive party of working people, when he attended the World Trade Union conference in London.

On Greek Independence day the police opened fire on a procession at Lefkoniko and two persons were killed and several injured. A commission of inquiry was set up on March 28. The government imposed a censorship until the commission had held its first meeting and this caused considerable resentment. The fact that up to September the commission had not published any findings was widely commented on in the local press.

In July the editor of a trade union paper won an appeal against a conviction for publishing an article entitled "Rich and Poor," "with seditious intention to promote ill-will between different classes of the population." The chief justice, Sir Edward Jackson, in allowing the appeal, held that the article was only socialist propaganda of a kind that a man must be free to publish if he wished "so long as there is any real freedom of discussion in this island."

The Colonial Development and Welfare act, 1945, allocated £1,750,000 to Cyprus for the next ten years.

**Gibraltar.**—Repatriation of evacuees remained a major problem, owing to the serious housing shortage on the Rock. In Feb. 1945 Sir Findlater Stewart, colonial high commissioner, was appointed to investigate the problem, and in August he reported that by June 30 10,950 persons had returned and that about 1,000 others were allowed to return to live with friends and relatives who had room for them; new temporary dwellings accommodated 1,600 persons but were used in the first place for relieving serious overcrowding in small tenements. Proposals for the construction of blocks of flats to provide accommodation for 1,000 families received official approval, but would not be completed until the end of 1947. Meanwhile it was estimated that there would remain more than 2,000 Gibraltarians to be repatriated, mainly from Northern Ireland.

In July elections for the city council were held under the new constitution of Dec. 1944, which provided for seven elected and six official members. Seven candidates supported by the Association for the Advancement of Civilian Rights swept the polls. Their program included public meetings of the council; limitation of the governor's power of veto; extension of the social services and quicker fulfilment of the housing program.

Gibraltar's allocation from the Colonial Development and Welfare act, 1945, was £100,000 for the next ten years.

**Malta.**—The national assembly, an unofficial but representative body formed for the purpose of drafting a new constitution, met for the first time on Jan. 20, 1945; Professor Contino Preziosi and R. G. Miller were elected president and secretary, and the assembly decided to elect a working committee of 12 to frame a constitution. At its third meeting the assembly approved of male and female franchise at 21. When, in July, it seemed apparent that the government intended to hold elections under the existing (1939) constitution, the elected mem-

bers of the council of government resigned on the grounds that under the existing electoral register only a section of the male population and no women would be represented.

In August a delegation of the Malta Labour party visited London to appeal to the colonial secretary for more vigorous measures for rehabilitation in Malta. They stressed the need for immediate and substantial aid from Britain to help Malta to surmount the grave economic obstacles which threatened its recovery.

Elections to the council of government were held on Nov. 10 under the 1939 constitution. There was a poll of 41.9% of voters on the register, the Constitutionists and Nationalists boycotting the election. Nine Labour members and one Independent were returned.

Under the Colonial Development and Welfare act, 1945, the token figure of £50,000 only was allocated to Malta as its needs were the subject of special negotiations. On Dec. 14 the national assembly voted that Malta's affairs should come under the dominions office instead of the colonial office. (J. R.A.)

**Merchant Marine:** see SHIPPING, MERCHANT MARINE.

**Mercury.** Production of the more important countries is shown in the accompanying table, so far as data were received in 1945.

World Production of Mercury, 1939-44

	(Short tons)					
	1939	1940	1941	1942	1943	1944
Canada . . . . .	0.2	77	268	518	845	368
Chile . . . . .	?	?	50	86	97	?
China . . . . .	187	129	248	180	130	114
Czechoslovakia . . . . .	101	98	?	?	?	?
Italy . . . . .	2,552	?	?	?	?	?
Mexico . . . . .	280	443	879	1,233	1,076	990
Spain . . . . .	1,365	1,984	3,286	2,747	1,815	?
South Africa . . . . .	—	?	8	22	45	?
United States . . . . .	708	1,436	1,707	1,932	1,973	1,432
Total . . . . .	5,700	?	?	?	?	?

**United States.**—Mercury production almost trebled in volume during World War II, increasing from 708.1 short tons in 1939 to 1,973.3 tons in 1943, but with the passing of the peak of war demand, dropped back to 1,432.2 tons in 1944, accompanied by a drop in imports from 1,817 tons to 743 tons. Consumption declined from 2,071 tons in 1943 to 1,630 tons in 1944. In the first three quarters of 1945 production dropped still further, to 1,005 tons, but imports rose to 1,991 tons and consumption to 2,139 tons. The relatively heavy consumption of the first nine months of 1945, greater than the full year 1944, was due to the development of a new type of dry battery using mercury as an active ingredient. While military demand for the time being put this use at the top of the list of mercury consumption, it remained to be seen whether the battery could be

produced at a price that could compete with the ordinary type of dry cell in the postwar market.

**Canada.**—Among the surprises brought on by war demand, the increase of mercury production in Canada ranked next after that in the United States. From practically nothing in 1939, output rose to 845 tons in 1943, making Canada the fifth largest world producer (assuming Italy still to be well toward the top of the list).

(G. A. Ro.)

## Meretskov, Kirill Afanasjevich

( ? - ), Russian army officer,

was in command of the Leningrad military district at the outbreak of the Russo-Finnish war, Nov. 1939, and was in part responsible for successful operations against the Finns. After the Germans attacked the soviet union, Meretskov was in charge of the defenses outside of the Leningrad area, and in Jan. 1943, together with Marshal Govorov, he lifted the land blockade of Leningrad. In the early winter campaign of 1943-44, Meretskov's forces on the Volkhov front participated in the Russian pincers operation which completely caved in wehrmacht defenses about Leningrad and captured Novgorod to the south. In the summer campaign of 1944, Meretskov was assigned to the Karelian front and again with Marshal Govorov launched the drive (June 10) that smashed through the Finnish defenses and compelled Finland to sue for peace. Meretskov was awarded the Order of Suvorov in 1944, and on Oct. 26 the Moscow radio disclosed that he had been elevated to the rank of a marshal. In Aug. 1945, when the soviet union sent three of its crack armies into Manchuria, Meretskov commanded the 1st far eastern army. Originally based in the Vladivostok area, this army broke through Japanese defenses along the Ussuri river and drove down the east coast of Manchuria into Korea.

**Merit System:** see CIVIL SERVICE, U.S.

**Mesotrons:** see PHYSICS.

**Metallurgy.** So many new developments in metallurgical procedure were coming to light as the veil of censorship was lifted that only a few of the more novel or important ones can be mentioned even briefly. Only a few reports were made on new features in Germany, but others would be known in time, some of which would doubtless be on a par with advances in the United States.

**Uranium and Plutonium.**—By far the most outstanding metallurgical development of the entire World War II period resulted from the research leading to the production of the atomic bomb. Here we have not only the fulfilment of the alchemist's dream of the transmutation of the metals, but we have even gone a step farther and have produced a new variety of uranium ( $U_{239}$ ) and the entirely new metal plutonium—not in amounts requiring the microscope and spectroscope to detect them, but certainly in pounds, and possibly even in hundredweights. In lieu of the pages of text that would be required to explain in detail what this has involved, it is possible here only to record the bare fact of the practical accomplishment of the primary object of a research project which in turn opened up such enormous future possibilities that in it on the one hand lie the seeds for the destruction of world civilization, and possibly even of the entire human race and the world itself, or on the other hand of furnishing the necessary impetus to bring nations into a sufficient degree of accord that they can dispense with war, while at the same time reap a harvest of untold benefits from a force created primarily for destruction.

**Beryllium.**—Windows for X-ray tubes were being made by powder metallurgy methods, to avoid the large grain size and brittleness inherent in cast beryllium.

**Boron.**—Metallurgically, boron made enormous strides. As an addition agent for low alloy steels, it was found to impart physical properties that would require much greater amounts of other metals; in aluminum permanent mould castings, boron as an addition refines the grain structure and produces round cavities instead of sharp, angular ones, without affecting corrosion characteristics or heat treatment, but at the expense of greater brittleness and some lowering of the physical properties.

**Stainless Steel.**—Conventional methods for the flame cutting of steel give poor results with stainless steel, because of the high melting point of the chromium oxide formed. A novel method of overcoming this difficulty lies in feeding into the cutting flame a finely divided flux, which combines with the oxide and reduces its melting point.

**Zirconium.**—Alteration of crystal structure during heating and cooling resulted in so much disintegration and cracking of zirconium refractories that their commercial utilization was hampered. These difficulties could be avoided by adding certain oxides as stabilizers, but the material remained sensitive to thermal shock, because of its low heat conductivity.

**Inspection Methods.**—By the substitution of high, intermediate and low toned sound signals for the usual visual gauge indications for oversize, good and undersize readings, it was possible to utilize blind operations for delicate gauging operations.

X-rays were used in a nondestructible gauging of the thickness of metal parts not accessible for ordinary procedures, by comparing the density of a negative made under standard exposure with others from metal of known thickness.

**Investment Casting.**—Where the number of pieces did not require conventional methods of forging, stamping and machining, investment or "lost wax" casting was applied for precision castings in limited numbers. The use of polystyrene and other styrol resins in the lost wax process was said to produce tolerances as low as 0.0002 in.

**Localized Heating.**—High frequency induction heating continued to develop as a means of providing flexible heat control, and the concentration of the heat in a specific area for soldering and brazing.

**Metal Cutting.**—Diamond metal cutting tools were being made with three to seven cutting edges side by side around the contour of the tool, so that when one edge is worn dull, the next one can be brought into line with a minimum loss of time.

**Powder Metallurgy.**—German metallurgists were reported to have perfected a method of producing high grade iron powder directly from liquid metal. Thousands of tons of the product were used in shell bands, with an increase of 20% in the life of the gun barrels, as compared with copper bands.

**Spinning.**—The production of bombs was greatly improved by the use of spinning methods in forming the nose and tail parts.

**Substitution.**—A saving of 80% in the requirements of copper for bullet jackets resulted from the use of steel plate clad with copper or gilding metal.

A different type of substitution came into play when it was necessary to use steel rolling facilities to supplement a shortage of capacity for rolling brass for cartridge cases. The chief difficulty to overcome was in controlling the grain size. (See also ATOMIC BOMB.)

(G. A. Ro.)

**Metal Prices and Production:** see MINERAL AND METAL PRODUCTION AND PRICES.

**Meteorology.** Although the wartime meteorological activities of the United States reached their peak in 1945 and began to contract before the year's end, it was apparent that professional meteorological services in general would

continue permanently at a much higher level than before World War II. Many of the field stations and research projects carried on primarily for military purposes after 1941 would be required for peacetime civil uses, and transfer of some of these from the meteorological divisions of the army and navy to the weather bureau was inaugurated. Co-ordination of inter-departmental meteorological plans and activities was continued primarily through the Joint Meteorological committee, and action was taken to compile the vast accumulation of world-wide data during the war as the basis for better understanding of atmospheric structure and processes that would lead to better forecasting. War needs had already led to wide-scale use of mechanical (punched-card) tabulation and sorting of data. This was to be continued. The war had also stimulated development of new meteorological instruments and adaptation of military inventions, no longer secret, for use in weather observations and research.

Chief among the latter were radar and radio direction finding. Both of these devices can be employed to detect meteorological elements hitherto hidden from observation. The detection of certain kinds of storms by radar was begun early in the war when radar technicians had noticed "ghost echoes" on their relatively primitive scopes, "echoes" later realized to be caused by thunderstorms. Within a 100-mi. radius, it was found, the location, extent, intensity, speed and direction of thunderstorms could be radar-detected. Other storms, too, could be followed from a distant observational post. Because of the closeness of the violent hurricane of Sept. 15, 1945, to the radar station, new findings about the nature of the hurricane were made possible. The general shape of the disturbance was plainly seen, and also the variation in rain intensity within the storm as bands of heavier rain moved across the pattern.

In addition to such uses, both radar and radio direction finding were becoming more extensively employed in plumbing the hitherto uncertain wind-flow patterns in storm and cloud. Since the upper air has been studied, it has been the regret of all meteorologists that pilot-balloon observation was restricted to clear skies or to the atmospheric layer beneath the clouds. These war-born devices could be used to follow balloons or radiosondes through all types of weather. The possible benefits to forecasting, to air navigation, and to research in storm structure were incalculable. Some stations were already equipped with these devices by the end of 1945 and installation of equipment at about 25 additional stations was planned for 1946.

With the aid of instrumentation of this type, practical results could be expected from a thunderstorm project launched during 1945 with congressional approval. In this project the weather bureau, with the extensive co-operation of the army air forces and the navy, undertook a detailed study of the microstructure and dynamics of the individual thunderstorm. In planning to use aeroplanes, sailplanes, balloons and radar, all operating in thunderstorms simultaneously with a micro-network of recording surface stations, the project's practical aim was to find methods of circumventing the dangerous parts of thunderstorms. Although hail and lightning are also important in the investigation, excessive thunderstorm gusts and turbulence are recognized as the principal hazards to be met. The A.A.F. was establishing an aeroplane and radar program in connection with the project, and the navy planned to operate "drone" or pilotless aircraft. These flight operations were to be carried out in Florida and in the middle west, co-ordinated with balloon, radar and ground observations. Dr. Horace R. Byers of the weather bureau and the University of Chicago headed the project, while Col. B. G. Holzman and Comdr. R. H. Maynard represented the military services.

In other matters it was also evident that although military

meteorologists were being rapidly released after V-E day, research was not being abandoned. Throughout 1945, the A.A.F. co-operated with leading universities in fundamental research. At New York university a study of vertical motions was conducted. Techniques were developed to measure such motion from upper-air observations, and studies were made of the typical distribution and frequency of observed magnitudes in important storm types. Although the magnitudes found were small—of the order of a few centimetres per second—they were well correlated with subsequent weather developments. Reports on other army-sponsored projects still awaited official release.

Objective techniques in forecasting continued to be a primary purpose of research in the weather bureau. Minimum temperatures, low visibilities, fog and stratus, ceilings, squall lines, thunderstorms and quantitative precipitation were some of the elements being studied with this view during 1945. New York university, the University of Chicago, the University of California at Los Angeles, and Massachusetts Institute of Technology at Cambridge, Mass., co-operated. Large-scale researches in cyclogenesis, convection, advection and convergence were also conducted. More basic synoptic data were made available for research during 1945 by the completion of monthly charts showing, for six levels up to 19 km., the normal pressures and temperatures, the extreme maximum and minimum temperatures and the normal winds throughout the northern hemisphere. Completed charts also showed monthly normal values of temperature, density, west-east and south-north components of wind velocity and altimeter correction, in vertical sections up to 19 km. along every 20th meridian throughout the northern hemisphere. To supplement the 40 years of northern hemisphere sea-level synoptic charts published in 1943, three-kilometre maps from Oct. 1, 1932, to Dec. 30, 1940, were also analyzed and prepared for publication. These printed maps were to be the same size as the sea-level maps and on semitransparent paper for use in conjunction with them.

Instrumental improvements were made by the weather bureau in the measurement of daytime cloud heights by ceilometer and in development of a recorder for the maintenance of a continuous ceilometer record. To obtain meteorological reports from selected sites in the hurricane area, automatic weather-reporting stations were developed and, with the assistance of the coast guard, three were established and were in operation at Dog Rock and Orange Cay in the Bahamas, and at Flamingo, Fla. Receiving equipment was installed at Miami and Key West. Of special interest, also, was the development of a spectroscope for measurement of the water-vapour content of the atmosphere—vertically or horizontally—along a light path. Its use as a practical field instrument in 1946 was indicated.

Progress continued in the field of hydrometeorology, a science which depends greatly on co-operation because of its alliance of hydrology and meteorology. The quantitative-forecasting program of the weather bureau, inaugurated in 1944, became routine at all forecast centres. As in other fields, experience was a good teacher; methods were formalized and results assured the program's continuance. The co-operation of the corps of engineers and the weather bureau in the study of major storms and the estimate of limiting rates of rainfall increased in importance as the postwar flood-control program got under way. A similar co-operative program between the weather bureau and the bureau of reclamation was begun during 1945. On the Pacific coast, army engineers worked with the weather bureau on a program of snow investigation. By means of melting-zone reconnaissance surveys, special fixed observers, and field laboratories in the Sacramento and Columbia river basins, efforts were made to determine the distribution of snowfall and

its effect on stream discharge. The influence of snow cover on runoff from rain and the direct contribution from melting snow were measured for purposes of spillway design, reservoir operation and streamflow forecasting. Related to this work was the expansion of the weather bureau program, begun in 1944, of forecasting spring runoff by statistical techniques based on index relations between selected monthly precipitation and temperature records and ensuing spring runoff.

Directly stimulated by the war was an important change in U.S. weather-map usage. Assured by the experiences of the weather services of the nations allied with the U.S. in World War II, the weather bureau during 1945 changed from the use of upper-air charts at fixed levels to charts at constant pressure. The change was not as drastic as it seemed; approximately the same levels were still used and contour lines served the purposes of isobars. Among the advantages was the fact that fewer isolines could represent the variation of more elements than was possible on the fixed-level charts. By the end of 1945 practising forecasters had grown accustomed to the new charts but were in sharp disagreement on the advantages of substituting a 1,000-millibar chart for the well-known sea-level chart. In this change of techniques the official use of the isentropic chart was discontinued. Although still possessing definite theoretical advantages, since air particles more often stay within isentropic surfaces than either fixed-level or constant-pressure surfaces, it was felt that for practical purposes the indications of the isentropic chart could also be deduced from the constant-pressure chart. As a practical matter, also, forecast-station routine and teletype schedules were both so crowded that omission of less useful charts and data was mandatory.

With its importance underlined by war needs, plans were begun in 1945, for the expansion of observational networks in the arctic, the source not only of cold waves but of other important large-scale weather controls. Well-equipped central supply bases for these isolated observers were contemplated as nuclei for the networks. Along the same lines, closer international co-operation in meteorological observations was in prospect. As part of this co-operation, the weather bureau would staff certain U.S. embassies with meteorological attachés. Also linked with the program was the continuation of training, under weather bureau auspices, of foreign students of meteorology at U.S. universities. During 1945 eight students from Latin America (Bolivia, Chile, Colombia and Mexico) were given the university training and, following it, internship at a forecast centre; eight Chinese students were given similar training. In 1946 Brazil, Cuba, Ecuador, Mexico and Panamá were to be represented.

The year witnessed the rapid expansion of the American Meteorological society as a professional society. Release of many war-trained meteorologists by the military forces strained the society's newly organized placement services, its advice and assistance being widely sought. The society's new *Journal of Meteorology* was auspiciously launched and favourably received, while its *Bulletin* grew in size. A contemporaneous appearance was that of the *Journal of Aeronautical Meteorology*, sponsored by the Air Transport Association of America. New books on meteorology continued to tumble from the presses, especially worthy of mention being a new text on *Dynamic Meteorology* by Jorgen Holmboe, George E. Forsythe and William Gustin of the University of California, Los Angeles, and a *Handbook of Meteorology* edited by F. A. Berry, Eugene Bollay and Norman R. Beers of the U.S. Naval academy. One of the widely applauded events of 1945 was the award of the William Bowie

LIGHTNING hit New York's Empire State building during an electrical storm on July 9, 1945. Photographed from a nearby building, the picture was a result of split-second timing

medal to Dr. Jakob Bjerknes by the American Geophysical union. First meteorologist to receive the award, Dr. Bjerknes was well known for his contributions to frontal theory and the modern concepts of cyclonic structure and rain formation. Great as were his scientific attainments, he was no less admired for the modesty and objectivity of his viewpoint.

**Weather of 1945.**—Repeated southeastward incursions of arctic air by way of the northern plains states brought the freezing line to the Gulf by the middle of January. Between the Rockies and the Great Lakes temperatures fell as low as  $-30^{\circ}$ , in New England as low as  $-10^{\circ}$ . Persistence of cold air over this large area kept moderate to heavy rains beyond its

\*The tables in the article "Meteorology," are intended only as a guide to indicate the order of magnitude of sunshine, rainfall and temperature variations throughout the United States during 1945, and not the country-wide maxima of these elements. The only comparison that should be made is between the cities actually listed.

periphery. Along its southern edge, moist air from the Gulf overran the cold wedge, causing freezing rains that glazed roads and disrupted transportation. Farther northeast the characteristic precipitation was snow which had no chance to thaw in the persistent cold. On Jan. 15-16 Harrisburg, Pa. experienced a record snowfall of 21 in. in 24 hr. Floods broke discharge records on smaller streams in Louisiana and eastern Texas while snow continued to pile up from Pennsylvania, northward and northeastward. A month-end arctic blast, more severe than its predecessors, brought  $-20^{\circ}$  temperatures to northern New York and New England and freezing weather into Florida as far south as Lake Okeechobee. Protective warnings from the weather bureau limited the resulting crop losses.

As a consequence, the month of January as a whole showed the country east of the Mississippi with below-normal temperatures, the greatest departures being  $-6^{\circ}$  to  $10^{\circ}$  over most of Ohio, Pennsylvania and New York. In this region the total of degree days—i.e., days requiring heat—mounted to 20% above normal for the month, despite coal shortages and oil quotas. At Canton, N.Y., temperatures went to zero or below on 31 days during December and January. In many places average temperatures were lower than during the same period in 1917-18. Westward from the Mississippi, most of the temperature departures were positive, averages being as much as  $6^{\circ}$  to  $9^{\circ}$  above normal from Kansas northward. Above-normal rainfall was confined to southern Texas, Louisiana, Florida,

the central great plains and the adjoining eastern slopes of the Rockies. In the northeast an area of above-normal precipitation was almost entirely snowfall; depths in this region equalled or exceeded the 5-ft. or 6-ft. depths characteristic of the higher elevations of the west. In Pennsylvania average snowfall for December and January was the greatest of record. Subnormal precipitation extended from the Great Lakes to the Ohio valley and in a broad belt from western Montana to southern California. However, although January precipitation in northern California was the lowest in 61 years, a month-end storm continuing into February caused major flooding in the Sacramento valley with runoff values approaching those of Dec. 1937.

In states north of the Ohio river critical water-supply shortages developed. Added to the effects of the cold weather and subnormal precipitation of January was a low ground-water level

resulting from deficient recharge for many preceding months. Storage reserves for domestic and industrial use were exhausted by the cities of Columbus and Lima, some curtailment of war production resulting. Here, thawing of the light to moderate snow cover would bring replenishment. But elsewhere thaws were hoped for as a preventive of a sudden oversupply of water later in the season. The unusual accumulations of snow in Pennsylvania, New York and New England equalled or exceeded the accumulation prior to the great floods of March 1936. There was a natural concern that warm weather and heavy rains might combine with this snow cover to produce serious floods, especially since ground-water and base-flow levels were also above average. In the same region, river ice—grown to more than 1-ft. thickness—promised ice jams in the spring. In Iowa, South Dakota and other northern states, on the other hand, the early formation of thick ice was hailed as an early beginning of ice harvesting.

Generally milder temperatures followed in February but a typical Atlantic coastal storm, a secondary low-pressure system developing southeast of a dying parent system over the upper Ohio valley, brought another severe snowstorm to New England. Drifts piled high by strong winds slowed traffic to a halt. In the heavy-rain belt bordering the Gulf a tornado swept across Mississippi and Alabama on Feb. 12, killing and injuring many. Along the Pacific coast the winter seasonal rains prevailed.

The rapid and frequent cyclonic developments of February brought equally frequent temperature changes and precipitation to the eastern half of the United States. The result was an abnormally warm month for the whole country, with greatest departures from normal in the northern great plains, the great basin and the northwest. Coal piles and oil tanks maintained cheerful levels. Precipitation was well above normal in a wide belt from western New York and Pennsylvania to central Texas, and also in California. In eastern Oklahoma it was as much as 300% of normal. Most serious deficiencies were in Florida, the lake region, the great basin and the far northwest interior.

In the Ohio valley water supply showed definite improvement. By the end of February the Ohio was in flood due to rains augmented by snow melt. The seven-month drought ended, but the flood brought loss of life, damage and disruption of transportation and industry. The predicted ice jams accompanied local breakups of ice in the Susquehanna and Allegheny rivers of Pennsylvania. Farther northeast the flood hazard was reduced. Substantial thawing had depleted coastal areas of snow and freed the downstream reaches of ice, clearing them for unimpeded flow from headwater areas where abnormally deep snow accumulations remained.

In the great basin continued sub-normal precipitation and high temperatures meant an unwelcome reduction of snow accumulation in the mountains. Since from this accumulation comes the main contribution to spring runoff, the outlook for prospective irrigation supplies was not favourable. In Florida, where February rainfall was from 10% to 50% of normal, water levels in the major canals and the Everglades were so low that all available pumping equipment was operated to supply the peak demands for irrigation of truck and other crops. In the Miami area the salt-intrusion dam was operated all month to conserve stored water and to halt the upstream movement of salt water toward municipal wells.

Rapid moderation of wintry temperatures continued in March. By the end of the month sections east of the Rockies showed mean temperatures mostly 10° above normal and as high as 15° above in north-central sections. Maximum temperatures occasionally reached 80° and 90° as far north as Wisconsin. Not after 1910 had such a widespread warm March occurred. Spring farming accelerated. Aided by adequate

moisture conditions in central sections, vegetation advanced so rapidly that by the end of March it was three weeks ahead of the calendar. This was accompanied by general apprehension over possible frost damage, since killing frosts may be expected as late as April 30 in these sections. March was also extremely wet, precipitation exceeding twice normal in central parts of the country. In contrast, the month was extremely dry in the Atlantic states and the western great plains.

Continued rainfall and snow melt kept the Ohio river in flood during the early part of March. In the upper Mississippi early breakup of ice raised the river to flood stages. Combining below Cairo, these excessive flows were augmented later by floods from excessive rainfall over the Arkansas and Red river basins. As a result, the lower Mississippi rose to stages ranking with those of April 1927 and Jan. 1937. In the north-eastern states pronounced thawing accompanied by relatively dry weather further removed the flood threat presented by the snow accumulation. River ice had also melted, without serious jams reported, the breakup occurring four weeks earlier than usual.

The Florida drought continuing, the water level in the Everglades lowered 2 ft. during March. Westward, in the coastal and intermountain states, however, both above-normal precipitation and below-normal temperatures increased mountain snow storage and brightened runoff prospects for the irrigation season.

A reversal to colder weather, freezes and frost came to the states east of the Rockies early in April. Damage to early fruit and other crops was not, however, as great as had been feared. In the north central states blizzard conditions followed the change of air mass, most of the snow cover disappearing within a week as temperatures moderated. Extensive heavy rains persisted over the central states past the middle of the month, over 12 in. falling in about nine hours at Seminole, Okla. This cloudburst caused heavy local damage and the loss of nine lives while other deaths, injuries and damages accompanied tornadoes that swept across Oklahoma and Arkansas. Most widespread consequence of the heavy rains was the moderate to severe flooding of rivers from Oklahoma to east Texas. Another significant result was the hampering of farming operations in the central agricultural sections, where the March impetus was about cancelled.

For April as a whole, the United States was again divided by the Mississippi river into an eastern section moderately warm and a western section moderately cool. But by the end of the month maximum temperatures in the 80s were occurring in western states as far north as Montana, and around 100° in the extreme southwest. Precipitation was 300% of normal over portions of Missouri and Kansas, above normal also in the middle Rockies, but still markedly deficient in the southwest and in Florida.

May reversed the temperature pattern of the immediately preceding months. From the western plains to the Atlantic averages were below normal; westward, they were generally above normal. Precipitation continued above normal in central and northeastern sections and in the Pacific northwest, but an extensive section of the southwest and also much of Florida actually experienced less than 10% of normal rainfall. The rainy season in Florida, which normally begins in June, was eagerly awaited. In the central states, however, where there was little cessation of the rains, farmers toiled nights and Sundays to bring their seasonal work up to date when conditions permitted.

Relatively cold weather prevailed over the eastern two-thirds of the country during the first half of June, with rains frequent and general in the northern two-thirds. In Ohio the coldest June weather of 30 years was reported. Widespread floods occurred in central valleys. By the second half of the month, however, high-pressure stagnant off the Atlantic coast brought southerly winds and midsummer weather as far

north as New England. Characterized by more sunshine, the warmer weather spread westward and improved agricultural conditions. Late in this period the first hurricane of the season developed in the northwest Caribbean and was near full strength when it curved northeastward across Florida from Tampa to Jacksonville. Although there was the usual damage to trees, roofs, transmission lines and crops, it was far outweighed by the beneficial results of heavy rain which broke the long drought. Across country, however, in New Mexico and Arizona, some localities experienced less than 20% of normal June rainfall.

July's most unusual feature was that its temperatures averaged close to normal throughout the country. Rainfall was of the summer type—caused by thunderstorm activity rather than by deep cyclonic systems. Since significantly above-normal totals occurred mostly in eastern and southern states, the turn to favourable agricultural conditions in central sections continued from June. From Vermont to Virginia flash floods were frequent. Many local records of short, intense rainfall were established in this region; near Washington, D.C., 6 in. fell in 50 minutes. A persistent northward current of maritime tropical air, rounding a Bermuda high displaced abnormally northward, was the basic cause of these excessive rains. Imbedded in the same current, Florida saw further improvement in its water supply. But in the southwest, rains were deficient and the normally dry summer conditions of the Pacific coast were extreme. Fires became a menace in the unnaturally dry forest regions.

August temperatures also averaged near normal over most of the country. Rainfall distribution was spotty. One consequence of the distribution of temperature and precipitation was that the central states, plagued by a combination of excessive rain and cold in the spring, were suffering lack of rainfall aggravated by high temperatures. In the Pacific northwest a like combination kept the forest-fire hazard active. The second great hurricane of the summer was responsible for an area of heavy rainfall along the Texas coast. Producing winds of 100 m.p.h. and tides as high as 10 ft., the storm's intensity diminished rapidly as it moved inland west of Houston. Timely advices by the weather bureau's special hurricane-warning network prevented great damage and loss of life.

Dominant storm of September was another hurricane which curved across Florida from west of Miami to east of Jacksonville, losing intensity all the way. From the coastal waters it moved inland again west of Charleston, dissipating in north-central North Carolina. Winds exceeded 100 m.p.h. over Florida's extreme tip but diminished thereafter. Floods caused the most widespread damage, a 52-year record being topped by the stage at Fayetteville, N.C.

Increasingly frequent southeastward incursions of cold air from the north shifted temperatures toward a fall pattern—relatively warm over eastern, southern and southwestern sections, relatively cool elsewhere. In the southeast the hurricane had increased rainfall to more than three times normal but over the southwest many stations reported no appreciable rainfall. In central sections, September produced an abrupt shift between two extremes, both agriculturally unfavourable—a shift from warmth and dryness to cold and wetness.

Frequent occurrence of the clear skies and mild temperatures typical of Indian summer improved the farming situation in October. Again near-normal temperatures prevailed. Most of the country was drier than normal although 500% of normal precipitation fell over northern California and west-central Nevada. The latter was largely the result of the first major storm of the season on the Pacific coast, depositing rainfall up to 10 in. and snow at altitudes above 8,000 ft.

By mid-November below-zero temperatures and snow cover overspread Montana and the Dakotas. Frequent cyclonic storms were followed by waves of cold air moving farther southeastward with each recurrence. The final storm of the month, an intense secondary development over the south Atlantic states, produced heavy snow and high winds—blizzard conditions—from Pennsylvania to Maine. Behind the storm system freezing weather descended to the Everglades, but timely warnings prevented extensive truck-farm damage. By the end of November the country north of a line from the middle Gulf to the Sacramento valley had experienced freezing temperatures. Nevertheless, the month averaged warmer than normal, with significant minus departures confined to the region from Montana to Minnesota. Precipitation was less than half normal in the great plains, the southwest, and the Atlantic and Gulf coastal plains, but much above normal from Arkansas-Tennessee to the middle and north Atlantic states, and also in the western lake region, the Pacific northwest and the northern great basin.

Short spells of wintry temperatures and snowy weather during early December were followed by a prolonged period of frigid temperatures and widespread snows. For one week around the middle of the month average temperatures were below normal throughout the entire country except in extreme southwestern California and extreme southern Florida. Over practically the entire area from the Rocky mountains to the Atlantic coast and southward almost to the Gulf minus departures exceeded 10°. Snow was common over the northern half of the country during this period, occasionally reaching as far south as northern sections of the Gulf states. In the vicinity of Buffalo, N.Y., snow drifted by strong winds piled higher than a man's head. Not only traffic but almost all other activities were stalled. Throughout the north and east even crack passenger trains limped into terminals as much as 20 hr. late. Deaths directly attributable to the severe weather occurred in 16 states, New York leading with 11 fatalities.

Moderation of the frigid and snowy weather followed, but occasional freezing rains added to the hazards at the southern edge of the snow cover and occasional blizzards caused by blowing snow occurred in north-central sections. By the end of December the snow cover had receded 100 to 200 mi. northward in most sections east of the Rockies.

On the Pacific coast, where moderate temperatures prevailed, persistent rains during the latter part of December produced general flooding from northern California to southwestern Washington by the end of 1945. Overflow was especially severe in the Willamette basin above Portland, Ore., rich farm land being inundated and transmission lines

washed out. (See also DISASTERS; FLOODS AND FLOOD CONTROL.)

## Methodist Church.

The Crusade for Christ which was launched by the general conference in 1944 with five objectives was pressed with vigour. For the first objective—\$25,000,000 for relief, rehabilitation and advance—more than \$27,000,000 was promptly pledged, on which \$21,979,481 was paid up to Dec. 14, 1945. Efforts were being made to add at least 1,000,000 to church membership and to arrest the alarming decline in Sunday school enrolment and attendance. Active membership in the church in Nov. 1945 was reported as 8,046,129, a decrease of 41,789 from 1944. In 3,360 pastoral charges not one new person was received, except by transfer. Although church school (Sunday school) enrolment was 4,898,096, the average attendance was less than one-half that number, and the children's division, which should be largest, was the smallest of the three. Officers and teachers numbered 476,363.

The Methodist Church contributed \$21,598,525 "for others" (benevolences), a material advance. For ministerial support \$42,216,131 was raised. This included the amount paid to retired ministers, and to bishops and district superintendents. The average ministerial salary was \$1,660 and a house. The current expenses of local churches totalled \$23,000,000. Church debt-paying was a feature of operations in 1945. For this the Methodists spent \$12,197,248. In 1944 the church paid \$116,223,876 for all purposes, which was at the rate of \$14.44 per capita. The largest church in the denomination was First Church, Houston, Texas, with 6,760 members, but the average pastoral charge had two small preaching places with a combined membership of 381.

The Board of Publication had its greatest year with sales of \$8,315,232. Its circulation of church school helps and story papers rose to 89,000,000 copies. It appropriated \$400,000 for distribution among the retired ministers. Among its new projects were a colour press for *The Christian Advocate*, whose weekly circulation exceeded 320,000; the provision of a scholarship fund for Methodist youth, designed to fit them for service among its 1,300 employees; and the erection of a headquarters building in Nashville, Tenn.

Changes in the College of Bishops in 1945 were the retirement of Bishop B. T. Badley of India, Bishop Gattinoni of South America and Missionary Bishop John M. Springer of South Africa. The Rev. Arthur F. Wesley, a missionary from North America, succeeded Dr. Gattinoni and the Rev. John A. Subhan, a Mohammedan convert, was elected by the India Central conference in succession to Dr. Badley; Dr. Newell S. Booth succeeded Dr. Springer. War conditions prevented elections in China and Germany. Bishop Ward was released from internment by the Japanese in China. Bishop Melle in Germany suffered much from the bombing and invasion, and reported the destruction of a large proportion of the Methodist Churches and other institutions in the reich. Bishop Edwin F. Lee, who escaped from Singapore when the Japanese invaded Malaya, and later from Manila, served in Washington, D.C., as head of the Chaplaincy commission. He made a flying trip to the Philippines, returning with reports of immense destruction. To meet the calls for relief and reconstruction which came from all the war-torn lands, the Methodist Committee on Overseas Relief raised \$673,296 in the fiscal year ending May 31, 1945. This

agency disbursed \$216,619 for China Relief, and through other channels more than \$460,000. To Archbishop Damaskinos, regent of Greece, the Crusade for Christ gave \$25,000 for child relief in that country.

The unification of Methodism, which had been stubbornly fought in the courts by a small group, was completely confirmed. The last move of the antiunificationists was to "perpetuate" the Methodist Episcopal Church, South, by setting up a South Carolina Conference of the M.E.C.S., taking advantage of a decision of a state court that the unified Methodist Church had no exclusive right to the names of the uniting bodies. To defeat this divisive movement the eight bishops of the southeastern jurisdiction of the Methodist Church—all of them former Southern Methodists, filed a suit in the federal court, which upheld the South Carolina decision. The bishops then took their cause to the United States court of appeals which reversed the decisions of the lower courts, and declared the union completely valid, awarding to the Methodist Church the exclusive use of the former denominational names. (See also CHURCH MEMBERSHIP.) (J. R. J.)

**Metropolitan Museum of Art:** see ART EXHIBITIONS; ART GALLERIES AND ART MUSEUMS.

**Mexico.** A federal republic of North America lying between the United States and Central America. Area, 767,168 sq.mi.; pop. (est. 1945) 21,672,733 (19,473,741 census 1940). Approximately 55% of the population was mestizo, 29% Indian, 15% white, with foreigners and others making up less than 1%. The language is Spanish, but an estimated 14% speak only Indian tongues. There is no official state religion, but the people are overwhelmingly Roman Catholic. The capital is Mexico City (pop. 1,464,556). Other principal cities are: Guadalajara, 228,049; Monterrey, 180,942; Puebla, 137,324; Mérida, 98,334; León, 86,089; Tampico, 81,334; Aguascalientes, 81,124; San Luis Potosí, 78,042; Torreón, 76,613; Veracruz, 70,958; Chihuahua, 57,456; Pachuca, 52,387. The president in 1945 was Gen. Manuel Avila Camacho (took office Dec. 1940).

**History.**—During the year 1945 Mexico occupied itself with World War II; became prominent briefly in world diplomacy; struggled against inflation and illiteracy; but, above all, entered with zest into its presidential campaign. President Manuel Avila Camacho's term was to expire in 1946.

Candidates for the position of president were numerous and colourful. Ex-Minister of the Interior Miguel Alemán had considerably the lead in popularity by the end of the year over his various opponents. He had the blessings of the administration, and the support of the principal Mexican Revolutionary party (P.R.M.). Alemán's campaign, opening almost a year before the July 1946 elections, was very active, with numerous speeches attended by large, cheering crowds. He was described as a handsome, young, clever lawyer who had been governor of the state of Veracruz, and who managed the campaign of President Avila Camacho in 1940. Alemán was known to be a little more liberal than President Camacho and furthermore had the backing of the senators, deputies and state legislators.

The most serious opposition to Alemán was the former foreign minister, Ezequiel Padilla. Padilla, who served under Gen. Zapata and Pancho Villa during the revolution, became a world diplomatic figure during the Chapultepec and San Francisco conferences. He showed himself, furthermore, to be a man of great oratorical ability. He acquired, however, a reputation for having been over-friendly and subservient to the United States. He also lacked the support of any powerful, organized political party, except of his own making. His support came from much more conservative elements than in the case of Alemán.

A GROUND CREW of the 201st Mexican fighter squadron checking a P-47 Thunderbolt. They arrived in Manila during May 1945 to join the U.S. 5th air force in the air war on Japan

Other candidates in the field included Gen. Calderón, Gen. Henriquez Guzmán, Rojo Gómez and Enrique de Montalvo. Also an important figure, but not an avowed candidate, was the labour leader, Lombardo Toledano. The extreme right, including the National Action party, the National Unification movement, and the Sinarquistas were represented as well, but had very little popular support.

Mexico's contribution to Allied arms remained an important issue during the first part of 1945. At the beginning of the year it was decided by the Mexican senate to send troops abroad when and where needed by the Allies. The only group ready to leave for overseas, however, was the Mexican expeditionary air squadron comprising 300 U.S.-trained airmen, who graduated early in January. In April the squadron left for the Pacific. They saw action in the Philippines where the Mexican airmen in U.S. Thunderbolts bombed and strafed enemy troops. The squadron was received back in Mexico, after the defeat of Japan, as conquering heroes with celebrations in the National stadium at Mexico City and decorations of service in the far east.

During the induction of its wartime army, the illiteracy problem in Mexico was highlighted. The problem was considered to be so serious that a program was launched in April 1945 whereby each literate Mexican citizen was required to teach at least one illiterate citizen to read and write. While the results from the program were not yet known, the general effect was thought to be very great in making a substantial reduction in illiteracy.

The year 1945 was an important one for Mexico in international affairs. The Inter-American Conference on Problems

of War and Peace (*q.v.*), which ended its 16-day session on March 8, was held in the famous castle of Chapultepec in Mexico City. Manuel Tello acted as secretary-general, and was credited with having provided an excellently organized and efficiently conducted program. Mexico's foreign minister, then Ezequiel Padilla, representing the host country, was especially influential in the conference. He was assisted by the Mexican ambassador to the U.S., Francisco Castillo Nájera, who later became foreign minister.

Foreign affairs in Mexico were also concerned with a treaty with the U.S. for determining the allocation of the waters of the Río Grande, the Colorado and the Tiajuana rivers. Since the treaty would give large concessions to Mexico in regard to the Colorado river, the state of California registered a strong protest with the U.S. state department. However, after a number of months of negotiations, the treaty was signed by Secretary of State Byrnes and the Mexican Ambassador Antonio Espinosa de los Monteros. In spite of considerable debate both in the U.S. senate and the Mexican senate, the treaty was ratified by large votes. (*See also* IRRIGATION.)

Part of Mexico's foreign relations concerned its refugee colonies. Prominent among the refugee groups in Mexico were the Spanish Republicans. In January the Republicans called a meeting of the cortes in the Mexico City French club. Out of an original membership of 476, there were 90 present. The cortes adjourned without taking action on the organization of a new government, since so many members were missing. Ex-Premier Juan Negrin finally arrived in Mexico from London, and promptly set to work to establish unity among the various groups. Finally, on Aug. 9, all parties except the Socialist Workers were sufficiently in agreement to elect Diego Martínez Barrio as president of the cortes. José Girál was later elected as premier of the new government.

The action of the cortes was shortly followed by official recognition, on Aug. 30, by Mexico as the official Spanish government-in-exile. Other Latin-American countries followed Mexico's lead. This action on the part of Mexico was expected to be of considerable aid to the Spaniards who had been making their homes and plying their trades and professions in Mexico. Previously, all assistance to these elements had to be unofficial through lack of any official channel other than the representatives of Franco Spain.

Another refugee group in Mexico included the Polish colony at Santa Rosa, Guanajuato, Mexico. In the sanctuary at Santa Rosa 1,400 Poles established themselves.

The case of the German internees at Fort Perote at Veracruz was quite different in some respects. Until the collapse of Germany, the internees had been held as prisoners, except that they had always been given considerable freedom within the fortress. As soon as Germany collapsed, Pres. Avila Camacho issued an order for their release and arranged for each man to receive 1,000 pesos to begin life anew. They were further given the privilege of applying for citizenship and of travelling freely so long as they kept the department of the interior apprised of their whereabouts. Most of the internees promptly found employment, and the greatest portion of them had already declared their intention of becoming citizens.

On the educational side, the University of Mexico again was prominent in the events of the year. In March, a new rector for the University of Mexico was chosen to succeed Alfonso Caso. The supreme governing body of the university, the *Junto de Gobierno*, after considerable deliberation chose Lic. Genaro Fernández MacGregor of the faculty of jurisprudence for the usually stormy post of rector. MacGregor announced a policy of complete academic freedom.

Economically, Mexico struggled with inflation, strikes and re-

conversion from wartime conditions. While direct participation in war activities, although costly, were not of such magnitude as to cause great national strain, Mexico reflected the dislocations felt in other parts of the world. This was largely because it had what has been described as a "colonial" or dependent economy. Most of the consumer goods and food, for example, used in Mexico had come from the United States or Europe. When normal markets and sources of supply were cut off or interfered with, Mexico began to feel the strain the same as the warring nations.

As might be expected, one of the powerful effects on Mexico was a tendency to inflation or rising prices. During World War II, Mexico's cost-of-living indexes showed a rise of more than 270%. But even more significant, articles such as clothing and food went higher: clothing reaching 347% and food, 279%. This occurred even though Mexico had established price controls and had carefully pegged the peso in terms of the dollar.

Many movements were begun in Mexico to strengthen its economy. Perhaps the most startling was an attempt on the part of labour and management to form a type of "alliance." Thirty of the Mexican industrial leaders, headed by Aurelia Lobatón, José D. Lavín and Aarón Saénz, met in April at a banquet in Mexico City with 30 labour leaders, headed by Vicente Lombardo Toledano, Fidel Velásquez and Juan Elizondo. The most powerful labour unions and the largest industries were thus represented.

The "alliance" as finally defined and agreed upon in a jointly signed document, was for the purpose of achieving certain national goals. These were principally to establish a more self-sufficient economy for Mexico. At the same time it was agreed that the policy of self-sufficiency should not exclude economic participation with other nations, but co-operation with the United States and other countries should be in terms beneficial to Mexico. It was further stated that the rights of the separate classes of labour and management would in no way be prejudiced by the agreement. The agreement was solely for the purpose of furthering the national interest. What effect the "alliance" would have on the future relations of Mexican labour and management remained to be seen, either in terms of the agreement or in terms of a precedent for future agreements.

Rising prices and new dislocations following the termination of the war had their effects in labour restlessness. A considerable increase in strikes, and in conflicts which were settled without strikes, was registered in 1945 over the previous year, which had had a total of 2,612 disputes.

One of the most serious difficulties arose over a discussion of the textile industry in April to modernize its machinery. It was proposed to install automatic equipment so as to double the output of many of the workers. At the same time, the industry decided upon a type of unemployment insurance which was designed to give displaced workers assistance during the period they would be searching for other employment. A threat of strike soon developed with a demand for a rise in wages. The matter was finally settled by arbitration.

The strike which received very wide notice was that in the Mexican motion picture industry. The dispute was over re-employment rights of some discharged workers. Their reinstatement or the payment of a 150,000-peso fine was demanded.

Citing a general rise in the cost of living on the one hand, and increased-revenues on the other, the silver miners of Mexico gave notice in November of their intention to strike. The demand was for a rise of wages of almost 40%. Government arbitration finally prevailed.

In agriculture, bad weather gave Mexico bad crops for another year. However, in one respect, agriculture showed an appreciable gain. Irrigation works were increased until expendi-

tures in this regard reached 10% of the total national expenditures. This was almost five times the outlay under the former president, Gen. Cárdenas. The government officially expressed the opinion that from 10,000,000 to 15,000,000 ac. of arid land could possibly be irrigated.

**Education.**—Education was free, compulsory and divorced from religion. Private schools were allowed, however, to teach religion. There were approximately 25,000 primary schools, with about 2,000,000 enrolment (15,531 government, with 1,343,504 enrolment). Secondary schools had about 80,000 enrolment (45,534 enrolment in government schools, including technical and agriculture). Also, the 10 universities had about 30,000 enrolment, of which 22,230 (1945) attended the autonomous University of Mexico, Mexico City. Illiteracy was about 35%; however, this number was expected to decrease substantially under the impact of the new program of "each person teach one person to read," and as a result of special instruction given to all personnel who were illiterate.

**Finance.**—The monetary unit was the peso (value in Nov. 1945, 20.578 cents U.S.). By August money circulation, including bank deposits, had risen to a total of \$837,254,250, of which \$307,416,550 was in paper money; \$119,212,850 in coin; and \$410,625,250 in the form of deposits. This surpassed the same period in 1944 by \$174,554,450.

The national budget for 1945 showed a drop from the 1944 high of \$227,150,000 to \$207,377,625. Some of the more important items were: agriculture, \$35,931,000 of which \$29,942,500 was set aside for irrigation; public education, \$35,311,500; national defense, \$35,208,250; navy, \$7,702,243; communications, \$33,127,762; public debt, \$17,065,779; public health and welfare, \$13,422,500; treasury, \$9,770,547; investments, \$4,956,000; national economy, \$2,845,363; interior, \$2,577,533; agrarian, \$2,270,467; foreign affairs, \$1,280,300; legislative, \$1,898,561; judicial, \$1,260,682; labour, \$1,123,360; Indian affairs, \$796,883; attorney-general, \$493,948; presidency, \$334,943.

Bank loans in 1944 totalled \$1,901,415,036. Of these, 46% went to commerce; 36% to industry; 12% to agriculture; and 6% to mining and stock raising.

**Trade and Communications.**—During the last half of 1944 and almost all of 1945 imports exceeded exports, a reversal of experience during former years. Total volume for 1945 was estimated to fall below the 1944 figure. United States received 87% of the trade; Latin America 5%; and Europe 3.9% (most of which went to Great Britain).

Exports in 1944 equalled \$278,506,550 (\$233,316,090 in 1943). Gold, silver, copper, lead, zinc, oil and other mining products comprised some of the largest single items of export. Beef, henequen, tomatoes, chicle, bananas, coffee, chick peas, cotton, vanilla, vegetable wax and fodder stood high on the export list. Values according to certain general classes during 1944 were: animal products \$14,303,950; vegetable products \$79,027,550; mineral products \$61,046,800; fuels \$6,814,500; textiles \$25,998,350; food and beverages \$20,711,950; other products \$11,944,400. It should be noted that for the first time vegetable products surpassed mineral products in value.

Imports in 1944 were \$216,370,700 (\$187,997,600 in 1943). Manufactures including machinery and processed items comprised the largest portion of the imports. Values according to certain general classes during 1944 were: animal products \$35,187,600; vegetable products \$63,622,650; mineral products \$48,155,800; textiles \$13,154,050; chemicals \$28,084,000; machinery and iron goods \$40,990,250; scientific apparatus and vehicles \$24,325,700.

External communications were by sea, especially through Veracruz; by three main railways to the United States and one

to Guatemala; by air to all parts of the hemisphere; and by a growing network of motor highways.

The National railroad hauled 8,895,806 tons during 1944, a total almost equal to the freight hauled by all remaining railroads. Total freight carried was 17,117,277 tons. This was a decrease from the 1943 figure. Railroad mileage was about 15,000 mi. in 1945. There were more than 36,000 mi. of improved roads, of which 5,000 were paved, and 7,000 were traversable in all types of weather.

**Agriculture.**—Mexico had an estimated 37,050,000 ac. of tillable land, of which 13,410,556 ac. were under cultivation according to the 1940 census. More than 17,000,000 ac. were under cultivation in 1945. Forest land comprised 25,893,993 ac.; grazing land, 69,713,715 ac.; 2,471,000 ac. were estimated to be under irrigation by the end of 1945 (more than 2,000,000 ac. of this were under cultivation). Latest estimates on amount of land which could be irrigated if all potential waters were employed equalled about 12,000,000 ac.

Agricultural production was (in tons, 1943, unless otherwise indicated): maize, 2,639,807 (1944); wheat, 424,152 (est. 1945); sugar, 427,900 (1944); rice, 127,576; beans, 171,600; large kidney beans, 18,594; tomatoes, 190,000; chick peas, 82,056; sesame, 96,072; pineapples, 71,700 (1944 marketed); coffee, 54,000; henequen, 660,236 (bales 1944); chicle, 10,400 (1944-45); alfalfa, 2,060,500; green peppers, 34,629; potatoes, 135,770; sweet potatoes, 65,806; cotton 508,267 (bales 1944); vanilla, 164; avocados, 60,104; cacao, 1,650; bananas, 7,200,000 (bunches).

Animal census (1940) by head was: cattle, 11,621,879; horses, 2,511,175; mules, 932,522; donkeys, 2,341,539; sheep, 4,401,014; goats, 6,849,709; hogs, 5,067,642. An estimated 164,000,000 ac. were devoted to range.

Timber produced in 1942 was: 33,315,000 cu.ft. of pine; 1,317,250 cu.ft. of mahogany; 1,045,320 cu.ft. of red cedar; 432,600 cu.ft. of white cedar; 91,820 cu.ft. of primavera. Charcoal, resins and other products equalled 50,265 tons.

**Manufacturing.**—During 1945 there was a steady expansion in Mexican industry. New developments during the year included the establishment of rayon factories (additional annual capacity 17,000,000 lb.); tire factories; medical supplies manufacturers; cement factory; hardware and locks manufacturers; and a fruit packing plant.

The large textile industry (estimated production 600,000,000 yd.) took steps during the year to modernize its machinery. Other important classes of manufacturing firms were: sugar mills; alcohol distilleries; cigar and cigarette (917,000,000 packs) factories; shoe, binder twine and soap factories; chemical works; breweries; flour, paper and coffee mills; iron and steel mills and foundries (steel production was up 25% during 1945); cement manufacturers (688,969 tons in 1944); ice plants; glass and ceramic works; and woodworking shops.

**Mineral Production.**—Although the relative importance of mining to Mexico's economy had decreased, it was still of basic importance in 1945. Actual mining production in 1944 was lower by 25% than in 1943. Total value of metals during 1944 was \$146,408,500, of which precious metals amounted to \$50,786,610; industrial metals amounted to \$90,442,447; and metal-oids amounted to \$5,179,226. Production of various metals during 1943 was: gold, 1,022,238 oz. (1944); silver, 2,960 tons; copper, 54,751 tons; lead, 239,938 tons; zinc, 216,918 tons; antimony, 15,050 tons; arsenic, 22,331 tons; bismuth, 193 tons; cadmium, 882 tons; coal, 1,127,858 tons; strontium, 3,056 tons; tin, 475 tons; graphite, 22,744 tons; iron, 151,763 tons; manganese, 25,245 tons; mercury, 1,074 tons; molybdenum, 2,086 tons; tungsten, 270 tons.

Petroleum production, after declining rapidly from a total of

43,304,179 bbl. of crude in 1941 to 32,955,000 bbl. in 1942, increased to 36,383,455 bbl. in 1944. Refinery products in 1944 equalled 34,660,000 bbl.

During 1944, 27 new wells were sunk of which 24 were producers. Lack of shipping facilities still hampered the Mexico oil industry.

**Mica.** United States.—Statistics on mica production and consumption in the United States during World War II were available, and the salient figures on the industry are as given in the Table.

Data of Mica Industry in the U.S., 1940-44

	1940	1941	1942	1943	1944
Amount sold or used					
Sheet and punch . . . . .	812.7	1,333.2	1,380.9	1,724.1	761.7
Scrap . . . . .	22,386	32,500	43,262	46,138	51,727
Total . . . . .	23,199	33,833	44,643	47,862	52,489
Imports . . . . .	7,688	8,300	11,294	13,759	7,242
Sheet and punch . . . . .	767.1	1,008.4	1,622.4	2,750.9	2,516.5
Scrap . . . . .	3,061	1,251	2,179	2,048	2,412
Splittings* . . . . .	3,860	6,041	7,493	8,960	2,314
Splittings, consumption . . . . .	2,459.4	3,648.8	3,318.3	4,206.7	4,408.5
Stocks, Dec. 31 . . . . .	1,111.3	1,825.2	1,873.6	1,016.4	1,012.1

\*Includes other manufactured forms.

These data reflect clearly the drop in demand that became manifest in 1944 for the strategic form of mica and resulted in relaxations in control measures. They also emphasize strongly the lack of ability to meet more than a small fraction of the emergency demand from domestic output, even at sharp increases in price, which rose from an average of 18 cents per pound in 1940 to 94 cents in 1943 and \$2.14 in 1944.

The greater portion of the U.S. imports from India in 1944 was splittings, while Brazil was the largest shipper of sheet mica, followed by Canada, Argentina and Madagascar.

**Canada.**—While mica production in Canada was reported to have decreased from 4,025 short tons in 1943 to 3,342 tons in 1944, these figures included large amounts of scrap mica. Strategic grades amounted to only 992 tons in 1943 and 652 tons in 1944.

**India.**—India is the world's largest producer of sheet and block mica and splittings, with exports totalling 9,539 short tons in 1940, 11,667 tons in 1941, 9,622 tons in 1942, 10,342 tons in 1943, and somewhat less in 1944. Little if any scrap is included in these figures.

Government purchase of Indian mica was scheduled to end on Nov. 30, 1945, to be followed by restoration of normal commercial operation.

(G. A. Ro.)

**Micara, Clemente** (1879- ), cardinal archbishop of Apamea in Syria and apostolic nuncio to Belgium and internuncio to Luxembourg, was born at Frascati, Italy, on Dec. 24. As a young priest he entered the corps of papal diplomats, shortly reaching the rank of nuncio. Named nuncio of Belgium and internuncio of Luxembourg in 1923, he became dean of all apostolic nuncios.

Following the German occupation of Belgium in 1940, Arch-

bishop Micara was expelled, together with other diplomats, and returned to Rome where he remained throughout the World War II period, engaging in special work with the secretariat. He joined the Belgian exile government at London in the summer of 1944, and later returned to Brussels.

Archbishop Micara was nominated to the Sacred College of Cardinals according to an announcement released Dec. 23, 1945, and he was created and proclaimed a cardinal on Feb. 18, 1946.

**Michigan.** One of the north central group of states, Michigan was the 26th state admitted to the union; it is popularly known as the "Wolverine state." Area 97,940 sq.mi. (including 39,960 sq.mi. of Great Lakes water surface); pop. (1940) 5,256,106; (estimate, Jan. 1, 1946, 6,100,000). Of the state's population in 1940, 3,454,867 were urban, 1,801,239 rural. Whites composed 95.9% of the population, nonwhites 4.1% (215,934). Capital, Lansing (78,753). Larger cities were Detroit (1,623,452), Grand Rapids (164,292), Flint (151,543), Saginaw (82,794).

**History.**—Michigan experienced especially difficult problems of reconversion following V-J day. During the closing weeks of 1945, public attention throughout the country was concentrated upon the huge strike which began in the General Motors plants (Detroit, Flint, Pontiac, Lansing, Grand Rapids and other cities) on Nov. 21. Ranking fourth among U.S. corporations in the number of employees, the General Motors corporation was, it was commonly recognized, in position to influence vitally the whole postwar labour situation. By the end of 1945 no promise of a settlement was yet at hand. Other automobile plants also experienced production difficulties; total automobile production in Michigan in 1945 was less than 15% of that anticipated in early fall.

The 63rd legislature, convening in regular session at the beginning of 1945, was strongly Republican in personnel. For the better part of two months, however, the nominal Republican strength of 24 was reduced to 21 by the resignation of one member charged with graft, the murder of another, and the failure of a third to attempt to occupy his seat, following conviction on the charge of conspiring to buy and sell votes. On the Democratic side, a member previously convicted of recount fraud, was allowed to retain his seat despite some effort to unseat him. The legislature, remaining in session until April 26, passed a total of 381 measures. Except for a few, however, the acts were of routine or limited importance. An annual budget of \$162,500,000 was adopted, representing an increase of \$25,000,000 over expenditures for the fiscal year. New or increased taxes were placed on whisky, on bank accounts and other intangible property, and on horse racing. A state department of mental health was created to replace the State Hospital commission. To combat juvenile delinquency, a Michigan Youth Guidance commission was set up for at least a two-year period. A state department of aeronautics was also established. Of the 381 measures passed, four were vetoed by Governor Harry F. Kelly. The failure of the legislature to adopt more significant legislation was ascribed by some of the members to the "dampening effect" of the grand jury investigation into charges of fraud in the state legislature.

Late in 1945, the governor called the legislature into special session in Jan. 1946, to deal particularly with the state's building program.

In the 1945 spring election, Justices Raymond W. Starr and Walter H. North were by large majorities elected to succeed themselves, as members of the state supreme court. For the remaining offices, the Republican candidates were uniformly successful. Charles M. Ziegler was re-elected state highway commissioner; Eugene B. Elliott, superintendent of public instruc-

tion; and Melville B. McPherson and Forrest H. Akers, members of the state board of agriculture. (Following the death of McPherson, Governor Kelly in July appointed Frederick H. Mueller to succeed him.) New officials chosen were Dr. Charles S. Kennedy and Otto E. Eckert as members of the board of regents of the University of Michigan (making the board completely Republican for the first time in 12 years); and Charles G. Burns as member of the state board of education. A constitutional amendment intended to liberalize the existing 15-mill limitation in order to permit local units of government to finance public building, construction of public works, and acquisition of sites through majority vote of taxpaying electors, was defeated; an amendment to allow state participation in control of rivers and lake levels, was adopted.

Total state revenues for 1944-45 were the highest in history, amounting to \$258,232,442. Nearly 40% of the total came from the sales tax. The combined surplus on June 30 was \$79,034,932. Federal benefits to the state amounted to \$30,300,000. Michigan's wealth was revealed by the fact that with only 3.2% of the population of the United States, its federal tax load amounted to nearly 6% of that levied in the country.

By Nov. 30, more than one-third of the 613,542 men Michigan had sent into the armed services had returned to their homes.

**Education.**—There were 6,029 school districts in the state public school system in 1945, with an average membership of 588,501 pupils and 18,626 teachers in the elementary grades, and 346,643 pupils and 11,965 teachers in the secondary grades. State expenditures for education in 1944-45 amounted to \$68,173,578. The ending of hostilities in August brought a tremendous upsurge in the enrolment of the various universities and colleges in Michigan, with particularly acute housing problems at the University of Michigan, in Ann Arbor, and at Michigan State college, in East Lansing.

**State Insurance and Assistance, Public Welfare and Related Programs.**—State hospitals for the physically ill had a population of 558; those for the mentally ill 20,971; welfare institutions 1,521; reformatories and prisons 7,493. Expenditures for public health and medical assistance were \$8,521,338; for mental hygiene \$13,683,826; for public welfare service \$48,458,529; for public safety, defense and adult corrections \$9,098,301. An inquiry into the administration of the State Prison of Southern Michigan (which with a population of 5,074 was reputed to be the largest prison in the world) instituted in March by Attorney John R. Dethmers, at the request of the Michigan State Police, resulted in the ousting in July of Warden Harry H. Jackson and six other officials and in loud public demands for a thorough revision of administrative practices in the institution.

**Communication.**—State highway fund expenditures of \$51,000,000 exceeded revenues for the year 1944-45 by nearly \$500,000, despite the fact that they were more than \$9,000,000 less than expenditures for the immediately preceding year. During the closing months of the calendar year, however, the lifting of gasoline rationing brought a sharp increase in revenue. A broad postwar program of repair and construction for the state's highway system was planned, comprising more than 9,000 mi. of trunk-line highways and 88,000 mi. of county roads. During the 1945 Great Lakes shipping season, 481,802,217 bu. of wheat passed through the St. Mary's Falls canal (the Soo canal)—constituting an all-time record. The amount of iron ore passing through the U.S. and Canadian locks, 78,039,957 tons, was about 5% less than the record for the preceding year.

**Banking and Finance.**—The 344 state banks in Michigan on June 30, 1945, had total assets of \$2,182,034,633.58; assets of three industrial banks totalled \$4,875,363.75; those of eight trust companies \$39,108,048.95; those of 38 building and loan associations, \$90,674,768.74. Total resources of 75 national banks operating in Michigan were \$2,687,848,000.

**Agriculture.**—The total acreage harvested was 8,253,500; the total value of field and farm crops \$7,150,000. Cash income from crops and livestock approximated \$500,000,000. Despite unusual weather conditions, wheat was a bumper crop, and the total tonnage of feed grain production (grain corn, oats and barley) was 18% larger than in 1944 and 24% above the ten-year average. The tame hay crop was 12% above average; red clover seed production was above average, alfalfa seed production only about 10% of the average. Field bean production was somewhat below normal. The combined tonnage of the principal tree fruits and grapes was only 40% of that of 1944. The apple production was only 16% of average, and peaches alone reached a substantial yield, production being 67% above average.

Table I.—Leading Agricultural Products of Michigan, 1945 and 1944

Crop	1945	1944
Corn, bu. . . . .	61,915,000	57,760,000
Oats, bu. . . . .	64,400,000	44,100,000
Winter wheat, bu. . . . .	27,648,000	23,640,000
Potatoes, bu. . . . .	18,700,000	19,548,000
Apples, com'l, bu. . . . .	1,250,000	7,625,000
Field beans, 100-lb. bags . . . . .	3,247,000	4,158,000
Barley, bu. . . . .	3,906,000	3,900,000
Peaches, bu. . . . .	3,848,000	3,600,000
All tame hay, short tons . . . . .	3,846,000	3,424,000

**Manufacturing.**—Because of war conditions, official statistics on manufacturing were not available beyond 1939. During the first half of 1945, Michigan maintained its leadership in war production, although war production demands—notably for the products of the great bomber plant at Willow Run—declined sharply. During the months following V-J day, reconversion proceeded rapidly, with the effect of labour-management difficulties in the automotive industry considerably neutralized by the conversion of the plant at Willow Run to the manufacture of Kaiser-Fraser automobiles.

**Mineral Production.**—Official figures on mineral production are shown in Table II. Iron and copper production was stimulated by war needs. Activity continued in the extension of Michigan's petroleum and natural gas fields.

Table II.—Mineral Production of Michigan, 1944 and 1943

	1944		1943	
	Quantity	Value	Quantity	Value
Iron ore, long tons . . . . .	13,693,377	\$38,537,000	14,510,357	\$40,258,096
Petroleum, bbl. . . . .	18,490,000	26,600,000	20,768,000	29,280,000
Pig iron, short tons. . . . .	1,617,912		1,492,942	24,782,464
Coke, short tons. . . . .	3,005,424	24,848,937	2,948,389	22,006,821
Cement, bbl. . . . .	5,177,176	7,733,185	6,430,404	9,285,815
Copper, lb. . . . .	84,842,000	11,453,670	93,528,000	12,158,640
Natural gas, M. cu.ft. . . . .	19,600,000	13,622,000	18,006,000	12,567,000
Salt, short tons . . . . .	4,287,758	14,921,719	4,284,685	14,472,820

**BIBLIOGRAPHY.**—*Michigan, A Guide to the Wolverine State* (American Guide Series, 1941); *The Michigan History Magazine*, quarterly; press releases and printed reports of the various governmental offices; *Michigan Official Directory and Legislative Manual*, published by the secretary of state biennially. (L. G. V. V.)

**Michigan, University of.** Between July 1, 1944, and June 30, 1945, 1,632 army and 1,941 navy trainees received instruction at the university and in addition 1,311 officers and officer candidates attended the Judge Advocate General's school occupying quarters in the law quadrangle. The major army groups were those in the intensive Japanese language course and the civil affairs training school, the latter of which was discontinued at the end of the Japanese war and its members sent into active service. For the navy, the V-12 course and the graduate school of naval architecture were the largest units. There were also medical and dental students from both services. War research was carried on, and the expansion of one government contract brought about the increase in the transactions of the department of engineering research from \$1,349,699 to approximately \$4,800,000 in a single year. Considering the needs of the institution in relation to rising costs and expected increase in enrolment, the state legislature of 1945 increased the mill tax appropriation for general expenses from \$4,804,000 to \$5,867,451 and appropriated \$1,500,000 for a general service and administration building, plus \$256,000 for repair and maintenance. The regents of the university also authorized a self-liquidating program of residence hall construction totalling about \$5,000,000, to provide accommodations for approximately 500 men and 650 women students and for 176 married couples. Plans were developed during the year with the expectation that construction would proceed in 1946. (For statistics of enrolment, endowment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

**Mikolajczyk, Stanislaw** (1901— ), Polish politician, was born in Gelsenkirchen, Germany, the son of a farm labourer who emigrated from Poznan province in western Poland to find work in the Westphalian mines. He was wounded during the Russo-Polish war in 1920. After the war, he entered politics and at the age of 29 was elected to the sejm, serving from 1930 to 1935. He was vice-president of the Polish Peasant party and was made its president in 1937. When the nazis invaded Poland in Sept. 1939, he saw military action in the unsuccessful defense of Warsaw. He fled to Hungary and later escaped to France. He became Presi-

dent Paderewski's deputy in the Polish parliament in exile, and succeeded to the presidency on Paderewski's death. Mikolajczyk became prime minister in 1943. He sought a settlement with the soviet union on the Polish boundary dispute; and in 1944 he conferred in Moscow with Premier Stalin on the issue. Mikolajczyk's efforts to achieve a settlement, however, were hamstrung by anti-soviet elements within his cabinet, and he resigned Nov. 24, 1944. Mikolajczyk endorsed (April 15, 1945) the Big Three decision on Poland which was reached at Yalta, and asserted that a close and lasting friendship with Russia should be the keystone of future policy. He accepted an invitation to confer with soviet leaders in Moscow on reorganization of the Polish cabinet in accordance with the Yalta agreements, and he joined the new Warsaw government as deputy premier, June 23.

## Military Academy, U.S.

A government institution at West Point, N.Y., for the practical and theoretical training of young men for the military service. Operation under the accelerated three-year curriculum was continued until after V-J day. During World War II, 2,624 officers were graduated, more than 800 of whom were commissioned as pilots in the army air forces.

In Sept. 1945 the academy adopted a provisional four-year curriculum, taking into account modern trends in education and the experience gained in the war. Uniform aviation training, sufficient to provide graduates with a competent grasp of combined operations, was prescribed for all cadets; but pilot training was dropped in order to provide time for military and academic subjects of more general importance to army officers.

The new curriculum adhered to the proven methods of the past, but included modifications and additions in keeping with experience in World War II. The basic sciences, chemistry and physics were grouped under the same department, and additional time was allotted in order to permit more instruction in nuclear physics. The course in electricity was extended to include basic instruction in electronics and communications. The course in economics, government and history was expanded to include geography and a more thorough study of international relations and economics of war. Each cadet was required to study one language instead of two; but the list of languages offered was enlarged to include Russian. Continuation of amphibious training, and close liaison with the naval academy were emphasized.

(For statistics of enrolment, faculty, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

**BIBLIOGRAPHY.**—The *Information Pamphlet, U.S. Military Academy*, obtainable from the Adjutant General, War Department, Washington, D.C., gives complete data on entrance requirements, examinations, courses, etc. (M. D. T.)

**Milk.** The production of milk in the United States in 1945 was estimated by the U.S. department of agriculture to be 123,000,000,000 lb. compared with 118,900,000,000 lb. in 1944 and a prewar average of 105,200,000,000 lb. in 1936-40. This was an all-time high record, 3% above the high yield of 1942. This high production was due to the combined advantages of the largest number of milk cows on farms on record at the beginning of the year in addition to a favourable season for pastures and an abundant supply of concentrated feeds. The average number of cows being milked was not only near the record but the average yield was also unprecedented. This was estimated to be about 4,800 lb. per cow, which was 5% above 1944 and 1% above the 1942 previous high record. In spite of the shortage of labour on dairy farms and general complaints by dairymen of government controls and shipping difficulties the output was maintained above the goal. The national

production was at the rate of 872.1 lb. per capita compared with 852.8 lb. in 1944 and an average of 805 lb. in 1936-40. The civilian population got about the prewar quality for domestic consumption, however, in spite of the withdrawals for lend-lease and military needs. Purchases for military uses were about 14,000,000,000 lb. and for export about 2,500,000,000 lb.

Restrictions on the sale of fluid milk and light cream were lifted on Aug. 1 to Oct. 1 in different markets. The restrictions of rationing were reduced later in the fourth quarter of 1945 with a corresponding increase in civilian consumption. The government ceased to require a set-aside of butter on Sept. 1 and with the end of World War II the army ceased its purchases of dried milk. The output of creamery butter had been severely restricted and was the lowest in two decades being only 1,764,000,000 lb. in 1945 compared with 1,841,000,000 lb. in 1944 and 2,243,000,000 lb. in 1935-39. The production of condensed and dried milk took an increased proportion of the supply, increasing to more than 4,000,000,000 lb. in 1945 compared with about 2,400,000,000 lb. in 1935-39.

The price of milk continued to be stable throughout 1945 at practically the same level as in 1944, which was much above the prewar level. Dairymen received the largest total return on record amounting to more than \$3,500,000,000, which was more than double the prewar total. Government incentives were a factor in attaining the high production and were authorized to continue through June 1946. The total of milk products required for relief uses was indefinite but was expected to offset a large part of the reduction of military and lend-lease takings. The number of cows being milked on farms began to decline in June 1945 and the decline continued to the end of the year, indicating that production in 1946 would be somewhat smaller than the record. Labour scarcity continued on farms and the supplies of machinery were not expected to meet the demand until late in 1946.

The civilian consumption of milk and its products in 1945 was estimated at 803 lb. per capita compared with 788 lb. in 1944 and 801 in 1935-39. Butter consumption dropped to about 11 lb. per capita compared with 12 lb. in 1944 and 16.7 lb. in 1935-39. Condensed and dried milk consumed in 1945 was 19 lb. per capita, compared with 16.7 lb. in 1935-39. Fluid milk consumption continued to show above the prewar level, being estimated at 432 lb. per capita compared with 340 lb. in 1935-39. (See also BUTTER; CHEESE; DAIRYING.)

**Mindszenty, Joseph** (1892- ), cardinal archbishop of Strigonia (Esztergom, Hungary), was born at Csehimindszenty, Hungary. He was ordained in 1915. Named bishop of Veszprima in March 1944, he was elevated to the archbishopric of Strigonia in Oct. 1944, to succeed Justinian Cardinal Seredi. He gained the bitter hatred of the Hungarian nazis because he consistently refused to submit to their threats, and was arrested and remanded to jail for four months in 1944 for defying Hungary's former nazi-sponsored Premier Frederic Szalasi. In his 1946 New Year's message he defended his people against the excesses of propaganda attacks but also reminded them that they had sinned and must do penance.

He was nominated to the Sacred College of Cardinals in Dec. 1945, and was created and proclaimed a cardinal at consistory on Feb. 18, 1946.

## Mineral and Metal Production and Prices.

The close of World War II brought an end to the censorship

of mineral and metal production that had been imposed in some degree by all of the belligerent nations, but this did not mean that immediately there would be full production and trade figures available for the war years from any and all sources. In the United States, statistical activity was greatly increased during the war, but most of the results were held confidential for the use of the war agencies. At the close of the war all of the usual and many of the new figures were released, and it was expected that more would be made available later. Wartime data were received from many other countries, and while it was possible to present a table of world production for 1944 that was reasonably complete, there were still gaps to be filled. In some cases there was not time to get the accumulated material organized and reported, while in others the postwar conditions were such as to preclude anything but essential work. The U.S. bureau of mines had representatives in most of the warring countries, and through their efforts much was done to fill in the gaps of the war years, but it was likely that in some cases the gaps would never be filled.

In Table II is presented an abstract of the opening and closing 1945 prices for the leading metals and their ores, as quoted on the New York and London markets. It is impossible to reproduce such data in anything like complete form, but sufficient

of the more important items can be shown to give a good comparison of the price conditions. During the war years prices for most of these commodities were under official government control in both countries. In most cases it will be found that the prices established under control were still in effect at the end of 1945. Relatively few changes were made in prices during the year, and in only a very few cases have normal market prices sagged below the ceiling prices established under control.

Table III shows the gradual expansion of the total value of mineral products of the U.S. during the war years, as reported by the U.S. bureau of mines. The values for 1945 were not reported, but in view of the declines in production in many lines, a decline in value was to be expected, probably about to the level of the 1943 total. (See also STRATEGIC MINERAL SUPPLIES, and the reviews of the various metals and minerals.)

(G. A. Ro.)

**Mineralogy.** The most important publication in mineralogy during 1945 was the "Symposium on Quartz Oscillator-Plates." The entire May-June number of the *American Mineralogist*, vol. 30, 1945, pp. 205-468, was devoted to the symposium, consisting of 14 papers by 8 specialists. The theory, preparation, mass production and the many uses of these important oscillating quartz plates for frequency or wave length control in radio transmitters and receivers and for use in electronic apparatus were described. One of the scientific and technological miracles of World War II was the astounding rapidity with which the enormous demands for these plates were met.

New minerals were described as follows: cattierite and vaesite, cobalt and nickel minerals from the Belgian Congo, by P. F. Kerr (*American Mineralogist*, vol. 30, nos. 7 and 8); brazilian-

Table III.—Value of Mineral Products of the United States

Year	(Millions of dollars)			
	Metallies	Fuels	Nonmetallies	Total
1938	892.6	2,820.3	650.3	4,363.2
1939	1,291.7	2,834.3	788.2	4,914.2
1940	1,678.6	3,116.5	812.8	5,613.9
1941	2,132.0	3,708.1	1,037.9	6,878.0
1942	2,363.9	4,103.4	1,109.0	7,576.3
1943	2,488.0	4,608.3	974.7	8,071.0
1944	2,340.0	5,212.0	900.0	8,452.0

ite, a phosphate mineral from Brazil, which, because of its attractive yellow-green colour and vitreous lustre, might find use as a gem, by F. H. Pough and E. P. Henderson (*ibid.*, vol. 30, nos. 9 and 10); banalsite, a new barium-feldspar from Wales, by W. C. Smith, F. A. Bannister and M. H. Hey (*Mineralogical Magazine*, vol. XXVII, no. 186). In "The Unfolding Crystal" (*Quarterly Review of the Michigan Alumnus*, vol. 52, no. 4), E. H. Kraus traced the remarkable advances made in 50 years in the study of crystals and the solid state of matter.

Two important and very useful dictionaries relating to gem minerals were published—"The Jewelers' Dictionary" by the *Jewelers' Circular-Keystone*, New York city, and *Dictionary of Gems and Gemology* by R. M. Shipley and others of the Gemological Institute of America, Los Angeles, Calif. An American edition of Webster's *Practical Gemmology* (London, England) was prepared by V. V. Hinton and issued as *Introductory Gemology* by the Gemological Institute of America. The users of industrial diamonds welcomed the publication of *Diamond Tools* by P. Grodzinski (Anton Smit, Inc., New York), which is an English translation, with revisions, of the author's important pioneering contribution *Diamant Werkzeuge* published in Berlin in 1936. The enlarged third edition of *Art of Gem Cutting* by H. C. Dake and R. M. Pearl (Portland, Ore.) is an excellent manual for those interested in the cutting and polishing of gems, either professionally or as a hobby.

**Roebbling Medal.**—At a special meeting of the Mineralogical Society of America held in New York city, Feb. 20, 1945, the fifth Washington A. Roebbling medal for meritorious achievement in mineralogy was awarded to E. H. Kraus. The address of presentation by W. F. Hunt, and that of acceptance, in which the contributions of the society and the advances made in the science during the World War II period were discussed, appeared in the *American Mineralogist*, vol. 30, nos. 3 and 4.

**Symposium on Diamonds.**—Because of the very large increase in the use of diamonds in industry, the third symposium on diamonds was held in Pittsburgh, Pa., Dec. 27, 1945, during the meetings of the Mineralogical Society of America. Nine highly important papers were presented which were to be published in the *American Mineralogist*, April, 1946. (See also MINERAL AND METAL PRODUCTION AND PRICES.)

(E. H. KR.)

**Mining:** see MINERAL AND METAL PRODUCTION AND PRICES. See also under separate minerals.

**Minnesota.** A north central state of the United States, popularly known as the "Gopher state." Area, 84,068 sq. mi., of which 4,059 are water. Pop. (1940) 2,792,300. The rural population was 50.2% of the total. Capital, St. Paul (287,736). The only city in the state with a larger population was Minneapolis (492,370); Duluth had 101,065. The native-born white inhabitants in 1940 numbered 2,474,078, foreign-born, 294,904 and Negro, 9,928. On Nov. 1, 1943, the bureau of the census estimated the civilian population of the state at 2,525,558; on July 1, 1944, the estimated civilian population was 2,508,663.

**History.**—Principal elective officials of the state in 1945 were: governor, Edward J. Thye; secretary of state, Mike Holm; treasurer, Julius A. Schmah; auditor, Stafford King; attorney general, J. A. A. Burnquist.

The legislature, meeting in regular biennial session, devoted itself largely to preparations for the demands expected in the postwar period. It authorized appropriations of \$19,512,000 for state buildings and improvements. The Minnesota highway department arranged for a program of highway building, which, with federal aid, was expected to make possible \$74,000,000 of

construction in the first three postwar years. A postwar planning commission was established to stimulate and co-ordinate postwar planning. An act was passed authorizing a veterans' service officer in each county to aid veterans. Funds for old age assistance, aid to dependent children, aid to blind and aid for local schools were increased.

**Education.**—Contribution of the state to local schools, including income from trust funds and fixed income tax allotments, was expected to amount to \$49,103,549 for the biennium that began July 1, 1945. Total public school expenditures for the 1944-45 school year were \$61,860,524, compared with \$53,404,416 in the 1943-44 school year. In 1944-45 Minnesota had 8,207 elementary schools, 654 secondary schools, 6 public state teachers colleges and 11 junior colleges. Enrolment was 309,934, with 12,007 teachers in the elementary grades; 160,515, with 7,516 teachers in the secondary grades; 802, with 98 teachers in junior colleges; 7,509, with 81 teachers in adult education classes; and 291, with 28 teachers in teacher training departments. Dean M. Schweickhard was commissioner of education.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Aid to dependent children was up 25% in Nov. 1945, compared with Nov. 1944, while old-age assistance in 1945 rose 10% and aid to blind rose 9%. During the year ending June 30, 1945, \$1,781,907 was spent on general relief, with the number of cases averaging 5,587; on old-age assistance, \$19,704,949, with the number of recipients averaging 56,033. A total of \$2,456,649 was spent on the aid to dependent children, with the number of families aided averaging 4,975 and number of children helped averaging 12,450. An average of 940 persons shared in a total allowance of \$407,069 in aid to the blind. The state prison, two state reformatories and two training schools for delinquents had a population of 2,236 inmates.

**Communication.**—Minnesota had, at the end of 1944, 11,233 mi. of state trunk highways and 104,778 mi. of other highways. Expenditure of the state for highways for the fiscal year ending June 30, 1945, was \$21,066,251. Railway mileage at the end of 1944 was 9,081 mi. There were 36 licensed municipal airports and landing fields in the state, 7 seaplane bases and 83 other privately-owned licensed airports.

**Banking and Finance.**—Deposits and resources of Minnesota banks reached a level on July 1, 1945, approximately 18% higher than the total on July 1, 1944. The 487 state banks, one mutual savings bank and four trust companies had deposits of \$675,887,000 and resources of \$722,944,000 compared with deposits of \$561,943,000 and resources of \$604,992,000 on July 1, 1944. The 183 national banks had deposits of \$1,869,395,000 and resources of \$1,980,701,000 on July 1, 1945, compared with deposits of \$1,595,435,000 and resources of \$1,697,272,000 on July 1, 1944. The state had 43 state building and loan associations on July 1, 1945, with resources of \$50,927,705. State expenditures for the year ending June 30, 1945, were estimated at \$103,289,049. Outstanding state bonds and certificates of indebtedness were reduced \$6,880,153 during 1945 to a net of \$72,414,241, making a \$57,373,419 reduction in seven years. Four principal trust funds of the state, income of which is devoted largely to schools, reached \$145,834,043 on Dec. 31, 1945.

**Agriculture.**—A record total of 6,059,000 ac. was planted to corn, Minnesota's most important field crop. This produced 217,248 bu., 14% less than the 1944 crop. Production of oats increased 50% over 1944. Value of the field crops produced in 1945 was estimated at more than \$550,000,000, a gain of about 10% over 1944. Production of creamery butter during 1945 dropped to an estimated 236,000,000 lb., compared with 251,613,607 for 1944, due to federal price control policies that allowed a greater return for creameries selling their product as cream, but Minnesota still held first place among the states in

butter production. For the calendar year 1944 the return from livestock and livestock products was \$786,399,000. The cash return from crops was \$140,383,000.

Leading Agricultural Products of Minnesota,  
1945 and 1944

Crop	1945	1944
Corn, all, bu. . . . .	217,248,000	253,399,000
Oats, bu. . . . .	242,640,000	155,960,000
Barley, bu. . . . .	13,224,000	13,844,000
Wheat, bu. . . . .	20,689,000	21,508,000
Potatoes, bu. . . . .	19,360,000	15,334,000
Flaxseed, bu. . . . .	11,913,000	6,514,000
Hay, tons . . . . .	6,290,000	6,172,000

**Manufacturing.**—Official figures later than 1939 were not available in 1945. According to the U.S. biennial census of manufactures in 1939, there were 4,008 manufacturing establishments, employing 92,084 persons. Wages earned amounted to \$125,442,031 and the output was valued at \$845,771,514. Manufacturing firms covered under the law paid wages estimated at \$485,000,000 in 1945, compared with \$502,761,539 in 1944 and \$168,124,794 in 1940. Number of employees was estimated at 229,000 in 1945 compared with 214,593 in 1944 and 118,945 in 1940.

**Mineral Production.**—Long the greatest iron ore mining centre, with more than 70% of U.S. production, Minnesota mines continued a high level output in 1945, with demands greatly enhanced by World War II. The output of iron ore for the year amounted to 62,823,700 gross tons, with a value of \$154,546,302 (at the mines). Production for 1944 was 66,586,264 gross tons, with a value of \$163,802,209 (at the mines). (E. J. Te.)

**Minnesota, University of.** An institution of higher education at Minneapolis, Minn. Enrolment of regular collegiate students, which started upward in the fall quarter of 1944, showed an accelerated increase which, in the fall quarter of 1945, reached a figure of 11,396—28% more than the previous year. Women students were still in the majority, constituting 63% of the total enrolment as compared with 70% in 1944. Veterans enrolled at the beginning of the fall quarter, 1945, totalled 1,096 as compared with 299 the previous year. The school of nursing, in order to meet war needs and without relaxing prewar standards, increased its enrolment to 1,155 and continued its rank as the largest school of nursing in the U.S. Dr. J. L. Morrill became president of the university on July 1, 1945. Dr. William H. Crawford became dean of the school of dentistry on the same date. Of the 700 staff members on leave for service in the armed forces or for other war-related work, 166 had returned, and 82 had terminated their service with the university. Thus nearly 69% were still on leave. New buildings scheduled for early construction included a \$2,000,000 Mayo memorial medical building, a \$1,469,000 mechanical-aeronautical engineering building, and extensive additions to the dormitory system. (For statistics of enrolment, faculty, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (J. L. ML.)

**Minor League Baseball:** see BASEBALL.

**Mint, United States:** see COINAGE.

**Miquelon:** see FRENCH COLONIAL EMPIRE.

**Missions, Foreign.** The end of World War II wrought some improvement for the foreign missionary enterprise. In Europe peace made possible the resumption of more of the support of missionaries who had been cut off from contact with their home constituencies. This was notably true of the French. Sailings for missionaries returning to their fields or going out for the first time became somewhat easier. A few new and old appointees went to India and Africa.

A limited number of senior missionaries were permitted to go again to China. Several British and American missionaries made their way into some of the portions of China which had previously been closed to them by the Japanese. Connections were re-established between the Christians, both Protestant and Roman Catholic, of Japan and the Philippines and their respective churches in the United States. In the United States programs were outlined and in part implemented by several of the denominations for raising large funds for the rehabilitation of church buildings, schools and hospitals damaged or destroyed in the war and for sending out reinforcements.

However, the ravages of war were by no means fully made good. Only a small number of missionaries could be sent to any one country. The doors to some lands, such as Korea and the Netherlands Indies, remained shut. Since almost all the former mission fields were in territories controlled by the United Nations, even more obstacles impeded the renewal of German missions than at the close of World War I. Currency inflation, rising costs of travel and living and the blows dealt by war to the European base of missions added to the problems faced by the foreign missionary enterprise. (K. S. L.)

**Mississippi.** A southern state of the U.S.A., admitted to the union in 1817, popularly known as the "Magnolia state"; area, 47,716 sq.mi. (47,420 sq.mi. land and 296 sq.mi. water); pop. (1940), 2,183,796; capital, Jackson (62,107). Other cities: Biloxi (17,475); Greenville (20,892); Gulfport (15,195); Hattiesburg (21,026); Laurel (20,598); Meridian (35,481); Natchez (15,296); Vicksburg (24,460). Of the state's population in 1940, 432,882, or 19.8%, were urban. In 1940 there were 1,106,327 whites; 1,074,578 Negroes; 2,177,324 native born; 6,472 foreign born. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 2,175,877.

**History.**—For 1944-48 the elected officers of the state, chosen in the Democratic primaries in Aug. 1943, and in the general election of that year, were: governor, Thomas L. Bailey; lieutenant governor, Fielding L. Wright; secretary of state, Walker Wood; attorney general, Greek L. Rice; state tax collector, Carl N. Craig; state treasurer, Newton James; state auditor, Bert J. Barnett. The superintendent of education in 1945 was J. M. Tubb.

**Education.**—In 1945 there were 1,319 white elementary schools in Mississippi and 3,637 Negro elementary schools, a total of 4,956. The enrolment in elementary schools was 489,666, of whom 232,185 were whites and 257,481 Negroes. The state had 565 white high schools and 100 Negro high schools, with a total enrolment of 67,426 in 1943-44. There were 9,082 white elementary and high school teachers, and 6,469 Negro elementary and high school teachers, a total of 15,551 teachers. The total enrolment in white elementary and high schools was 279,972; in Negro elementary and high schools, 274,784.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—From July 1, 1943, to June 30, 1944, the state department of public welfare paid \$2,915,206.75 to 29,017 recipients of old-age assistance; \$183,417 to 1,524 recipients of aid to the blind; and \$663,981.95 for aid to 3,462 families for 8,916 dependent children. The department continued in 1945 its regular program of child welfare services on all types of problems affecting children, particularly those children in rural areas. A special child welfare worker had been assigned to the State Industrial Training school for white children; and a special Negro worker had been added to the staff for assignment to the state reformatory for Negro children. The department of public welfare continued its service to the new parole board established by the 1944 session of the Mississippi legislature.

Through its division for the blind, the department maintained a program of sight conservation, restoration and services. It continued its program of training blind persons to work on factory-type sewing machines, making cloth bags of all sorts under government contracts. This division was also made the channel for federal funds for vocational rehabilitation of blind civilians.

**Communications.**—In 1945 the state maintained 6,493 mi. of highways and the counties approximately 54,000 mi. The total state expenditure for highways in 1944 amounted to \$3,126,242.89; in 1943, \$4,305,836.07; in 1942, \$5,552,046.54. The county expenditure for maintenance costs amounted to \$8,020,074 in 1944; \$8,069,506.06 in 1942.

The total mileage of railroads in the state on Dec. 31, 1944, was 3,947.33 mi.

**Banking and Finance.**—On Dec. 31, 1945, there were 179 state banks in Mississippi, with 22 branch banks and 31 branch offices. There were 23 national banks in Mississippi. The resources of the state banks were \$586,240,796.77 and total deposits were \$558,479,403.37; the resources of the national banks were \$240,474,988.99 and total deposits were \$230,239,008.29.

The balance in the general fund account as of Jan. 1, 1945, was \$12,918,667.93. On Dec. 31, 1945, it was \$23,160,421.35. The special fund account showed a balance of \$8,132,656.23 on Dec. 31, 1945.

On Dec. 31, 1945, the full faith and credit debt of the state (direct obligation bonds) was \$18,517,000; outstanding highway bonds amounted to \$46,430,000 (payable solely from gasoline taxes), making a total state debt of \$64,947,000.

**Agriculture.**—In 1945 there were 264,704 farms, exclusive of urban farms. In 1944 it was estimated that of the total land area 19,686,873 ac. were in farms, land in harvested crops being 6,524,000 ac. In 1944 receipts from farm marketings were \$359,467,000, of which \$282,488,000 were from crops and \$76,979,000 from livestock and livestock products; the value of farm products consumed in farm households was \$82,727,000. In 1945 the value of all crops was \$376,256,000.

Table I.—Leading Agricultural Products of Mississippi, 1945 and 1944

Crop	1945	1944
Cotton (500-lb. bales)	1,615,000	1,937,000
Cottonseed, tons	671,000	795,000
Corn, bu.	50,660,000	42,224,000
Oats, bu.	13,671,000	15,096,000
Hay, tons	1,185,000	1,139,000
Sweet potatoes, bu.	6,936,000	6,248,000
Sugar-cane syrup, gal.	3,910,000	3,630,000
Sorghum syrup, gal.	1,680,000	1,950,000
Peanuts, lb.	13,000,000	12,555,000
Pecans, lb.	6,000,000	8,300,000

**Manufacturing.**—The value of manufactures in the state in 1944 was \$383,876,507; in 1940, \$179,144,430. The number of persons employed in 1939 was 50,014; in 1944 (not including firms of fewer than eight employees), 163,892.

The wages paid in 1944 to persons employed in all industries employing eight or more persons amounted to \$201,790,000; in 1939, \$34,083,646.

In the period from 1933 to 1942, the value of manufactured products increased 442.2%, whereas the number of plants increased 100.7%. For the same period, wage earners increased 204.3%, while wages paid increased 569.2%.

**Mineral Production.**—The total value of mineral production in 1944, including natural gas, sand and gravel and other mineral products, was \$18,988,000. In 1944 about 16,337,000 bbl. of petroleum were produced; in 1943, 18,807,000 bbl.

Table II.—Principal Mineral Products of Mississippi, 1944 and 1943

Mineral	Value, 1944	Value, 1943
Natural gas	\$ 314,000	\$ 385,000
Sand and gravel	877,370	1,098,745
Petroleum	16,800,000	18,430,000
Other mineral products	397,115	564,065

In 1944, 1,200,000,000 cu.ft. of natural gas were produced; in 1943, 1,461,000,000 cu.ft.

On Dec. 31, 1944, there were approximately 450 producing oil wells in the state. (A. B. Bu.)

**Missouri.** A west north central state of the U.S.A., admitted to the union in 1821; popularly known as the "Show Me" state. Area 69,674 sq.mi. of which 404 are water. Pop. (1940) 3,784,664 (51.8% urban, 48.2% rural); 3,425,062 (90.5%) native white, 114,125 (3%) foreign-born white and 244,386 (6.5%) Negro. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 3,589,538. Capital, Jefferson City (1940 census) (24,268). Largest cities: St. Louis (816,048), Kansas City (399,178), St. Joseph (75,711), Springfield (61,238).

**History.**—The outstanding political event in Missouri during 1945 was the adoption of a new constitution on Feb. 27, 1945, by a vote of 312,032 to 185,658. The new constitution, which went into effect on March 30, 1945, provided, among other things, for a central revenue bureau, a department of public health and welfare, a commissioner of education selected by a bipartisan state board of education appointed by the governor, taxation of intangible personal property on the basis of yield, elimination of the fee system for remunerating most state and county officers, magistrate courts with practicing lawyers as judges instead of justice of the peace courts, decennial reapportionment of state senatorial districts, reorganization of county governments, voluntary consolidation or division of counties, a public record of votes on bills by members of legislative committees and state financial support of public libraries. It empowers the state supreme court to establish rules of practice and procedure for all courts, to transfer judges temporarily from one court to another and to settle election contests.

The work of implementing the provisions of the new constitution fell to the 63rd general assembly, which convened on Jan. 3, 1945, with Republicans in control of both houses. It was in session in Jan. 1946.

During 1945 there were other events of political importance. On April 12 Vice-President Harry S. Truman succeeded Franklin D. Roosevelt as president of the United States, thus becoming the first native-born Missourian to hold that office. On Jan. 12 Gov. Phil M. Donnelly appointed Frank P. Briggs (Dem.) to succeed vice-president elect Truman as U.S. senator from Missouri.

The major state officers (1945), all Democrats, were: Phil M. Donnelly, governor; Walter N. Davis, lieutenant governor; Wilson Bell, secretary of state; Forrest Smith, auditor; Robert W. Winn, treasurer; James E. Taylor, attorney general.

**Education.**—For the school year ending June 30, 1945, the public school system consisted of 7,925 elementary schools, with 473,418 pupils and 16,983 teachers; 861 secondary schools, with 147,426 pupils and 6,281 teachers; 5 state teachers' colleges, with 5,952 students and 383 teachers; Lincoln university (Negro), University of Missouri, (Rolla) School of Mines and Metallurgy, schools for the deaf and blind and a Negro vocational school. Roy Scantlin was state superintendent of schools.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—For the year ending June 30, 1945, unemployment insurance totalled \$27,983,584, and the government employment services made 361,182 placements. For the same period old-age assistance amounted to \$27,868,326, aid to dependent children \$4,325,823, general relief \$2,243,359 and blind pensions \$1,180,272. In June 1945, 100,406 persons received old-age assistance, 28,080 aid to dependent children, 19,838 general relief and 2,950 blind pensions. In 1945, the state penitentiary had an average of 2,540 inmates per day; the reformatory and

industrial schools, 950. In the same year expenditures for the penal and correctional institutions amounted to \$1,856,888.

**Communications.**—On Dec. 31, 1944, Missouri had 16,147 mi. of state highways and 100,650 mi. of rural roads. During 1944 the state highway department spent \$20,207,571 (state and federal funds), of which \$2,971,585 was for construction and \$5,518,726 for maintenance. On Dec. 31, 1943, railroad mileage totalled 6,913 mi. There were 810,059 telephones in Dec. 1945.

**Banking and Finance.**—On June 30, 1945, Missouri had 483 state banks, with deposits of \$1,773,871,000 and resources (loans and investments) of \$1,682,652,000; 79 national banks, with deposits of \$1,156,377,000 and resources (loans and investments) of \$1,212,583,000; 184 building and loan associations, with resources of \$161,667,370.

Total receipts of the state treasury during 1945 amounted to \$125,137,954; disbursements for 1945, \$109,245,354; gross state debt, Jan. 1, 1945, \$69,000,000 and net state debt, Dec. 31, 1945, \$63,000,000.

**Agriculture.**—In 1944 cash income from crops and livestock was \$682,923,000 and from government payments, \$25,159,000. The value of Missouri's 1945 crops, harvested from 12,506,200 ac., was estimated at \$317,815,000. The total crop production in 1945 was about 18% below 1944, principally because a wet spring delayed planting and a midsummer drought reduced yields.

Table I.—Leading Agricultural Products of Missouri, 1945 and 1944

Crop	1945 (est.)	1944	Value, 1945
Corn, bu. . . . .	105,840,000	162,554,000	\$119,599,000
Timothy hay, tons . . . . .	3,747,000	3,481,000	56,205,000
Winter wheat, bu. . . . .	22,518,000	21,998,000	34,678,000
Oats, bu. . . . .	31,161,000	29,970,000	23,059,000
Soybeans (for beans), bu. . . . .	9,490,000	10,605,000	20,024,000
Cotton, bales . . . . .	155,000	411,000	17,515,000

**Manufacturing.**—The number of persons employed in the manufacturing industries in Sept. 1945 was 306,600, or 28.8% less than the wartime peak of 430,500 in July 1943. Discontinuance of war industries, especially ordnance and aircraft, caused approximately 75% of the decline.

Table II.—Principal Industries of Missouri, 1939 and 1937

Industry	Value of products	
	1939	1937
Meat packing (wholesale) . . . . .	\$107,254,213	\$116,576,053
Footwear (except rubber) . . . . .	100,346,106	103,253,379
Iron and steel (excluding machinery) . . . . .	89,059,177	77,681,234
Wearing apparel . . . . .	85,297,177	76,998,667
Malt liquors . . . . .	41,412,301	34,272,016
Drugs, medicines . . . . .	23,006,499	24,335,460

In 1939, when the last U.S. biennial census of manufactures was taken, Missouri's industries manufactured products valued at \$1,388,056,267, employed 178,538 wage earners and 24,275 salaried persons, and paid \$190,735,851 in wages and \$58,937,137 in salaries.

**Mineral Production.**—In 1944 the value of Missouri's mineral production was \$72,369,000, slightly more than in 1943,

Table III.—Principal Mineral Products of Missouri, 1944 and 1943

Mineral	Value, 1944	Value, 1943
Lead . . . . .	\$27,949,280	\$27,736,500
Bituminous coal . . . . .	11,733,000	10,755,849
Zinc . . . . .	8,350,728	6,569,208
Lime . . . . .	5,820,028	6,046,453
Stone . . . . .	5,312,384	5,864,005
Cement . . . . .	4,881,516	7,024,285
Clay (raw and products) . . . . .	3,205,495	4,140,557

but 4.9% less than the wartime peak of \$76,122,304 produced in 1942. (R. P. Br.)

**Mitscher, Marc Andrew** (1887— ), U.S. naval officer, was born Jan. 26. He entered the navy in 1906 and had advanced through the grades to vice-admiral by 1944. He was in command of the aircraft

ADM. MARC A. MITSCHER, commander of task force 58, being transferred to another warship in a bosun's chair from his flagship, the carrier "Bunker Hill," as it lay blazing from the hits of two Japanese suicide planes off Okinawa on May 11, 1945

carrier "Hornet" when that vessel carried Gen. "Jimmy" Doolittle's army bombers within 800 nautical miles of Japan to bomb Tokyo, April 18, 1942. Mitscher's carrier task force participated in virtually every important naval operation in the Pacific war theatre in 1944. On June 23 the navy revealed that Mitscher had been selected to command task force 58, then described as the "most powerful and destructive naval unit in the history of sea warfare." During that year Mitscher's force participated in the Marshalls invasion, the attack on Truk, the Marianas invasion, the battle of the Philippine sea (1944), the Luzon and Formosa raids and the battle for Leyte gulf. In March and April of 1945, the carrier planes of Mitscher's task force slashed targets in Japan and the Ryukyus. On May 11, two Japanese kamikaze planes crashed on the deck of the carrier "Bunker Hill," Mitscher's flagship, taking the lives of 373 crew members. Mitscher was transferred to another craft. Although other naval officers asserted that the kamikaze attacks were destructive, Mitscher belittled their effectiveness. On July 14, he was relieved as commander of the 1st carrier task force and returned to Washington as deputy chief of naval operations for air. In another change (announced Dec. 4), Mitscher was made commander of the 8th fleet in the Atlantic.

**Mohammedanism:** see ISLAM.

**Molasses:** see SUGAR.

**Molotov, Vyacheslav Mikhailovich** (1890— ), Russian statesman, was educated at Petersburg polytechnic and during his youth organized bolshevik student groups and worked for the newspaper *Pravda*. February of 1917 found him a member of the Petrograd soviet executive committee. He was appointed president of the soviet of people's commissars in 1930, was named foreign commissar May 3, 1939, succeeding Maxim Litvinov, and signed the nazi-soviet pact of nonaggression in Moscow, Aug. 24, 1939.

On May 6, 1941, Molotov resigned as premier of the U.S.S.R.

and was succeeded in this office by Stalin; he remained as foreign commissar, however, and took over the vice-premiership. Three weeks after the German invasion of Russia, Molotov signed, July 13, the British-U.S.S.R. mutual-aid pact in which each nation agreed not to make a separate peace. In Aug. 1942, Molotov was named vice-chairman of the people's council of commissars. From Oct. 19 to 30, 1943, he presided at a tripartite conference with Anthony Eden and Cordell Hull in Moscow.

On Feb. 1, 1944, Molotov suggested a revision of the soviet constitution to enable each of the 16 republics of the U.S.S.R. to enter into direct relations and sign agreements with foreign powers. He participated in the Stalin-Churchill parleys in Moscow that ended Oct. 18. Molotov attended the Yalta parley (Feb. 4-11, 1945) and headed the soviet delegation at the United Nations conference in San Francisco. Although Molotov's objections to seating Argentina at the parley were rejected by a 31 to 4 vote (April 30), he nevertheless scored a diplomatic triumph; in admitting this avowedly totalitarian state, the western democracies weakened their arguments against admitting the Warsaw government. The Russian foreign commissar then attended the Berlin conference and represented the soviet union at the London Council of Foreign Ministers (Sept.-Oct. 1945). Molotov asserted the failure of this conference was due to refusal of the other powers to accept a soviet compromise plan for continuing the work on the European peace treaties. A later meeting of Molotov, Byrnes and Bevin at Moscow in December was more successful and the Big Three reached agreement (Dec. 27) on atomic energy control, the drafting of European peace treaties and on many phases of the far eastern problem.

**Molybdenum.** The following data on the molybdenum industry in the United States during World War II were made public, in millions of pounds of metal content of concentrates.

Metal Content of Concentrates of Molybdenum, 1940-44

	(In millions of pounds)				
	1940	1941	1942	1943	1944
Production . . . . .	34.3	40.4	56.9	61.7	38.7
Shipments* . . . . .	25.3	38.4	66.4	54.0	39.4
Consumption . . . . .	?	16.9†	56.4	49.9	31.5

\*Including exports.

†Second half only.

The tight position of molybdenum during 1940 to 1943 is reflected in a total production figure of 131,600,000 lb. as compared with shipments of 130,100,000 lb. Demand dropped sharply in 1944, after the peak of demand had been passed, and continued to drop in 1945. For the first half of 1945 production totalled 18,100,000 lb. and shipments 20,700,000, with an equivalent drop in stocks. This drop of more than two-thirds of the output between 1942 and 1945 covers not only the normal decline in the standard demand for the metal, but also a similar decline in the use of molybdenum as a substitute for tungsten.

(G. A. Ro.)

**Monaco.** A principality on the Mediterranean coast, bounded on the land side by French territory. Area 375 ac. (0.59 sq.mi.); pop. (census 1939), 23,973. Chief towns: Monaco, La Condamine, Monte Carlo; ruler: Prince Louis II; language: French.

On April 14, 1945, a financial agreement was signed with France which was designed to prevent further tax evasions by French persons and companies domiciled in Monaco, and to enable the French government to recover sums owed to it in the past by these tax evaders. It was also decided that a commission should meet every six months to examine questions arising from the agreement.

(J. RA.)

**Monazite.** Consumption of monazite in the United States dropped from 2,075 short tons in 1943 to 1,990 tons in 1944. With 3,262 tons in government stock piles, and industrial stocks equivalent to two years' demand, imports were allowed to drop from 4,980 tons in 1943 to 384 tons in 1944.

(G. A. Ro.)

**Monetary Units:** see EXCHANGE CONTROL AND EXCHANGE RATES.

**Mongolia** (OUTER AND INNER). A vast, arid, sparsely settled tableland in northeastern Asia, bounded N. by Siberia, E. by Manchuria, W. by Sinkiang (Chinese Turkestan), S. by China. Area: 956,844 sq.mi. Estimated population (no accurate census was ever taken) between 6,000,000 and 8,000,000. Politically, Mongolia is divided into the two regions, Outer and Inner. Outer Mongolia is the larger in size (622,744 sq.mi.), but Inner Mongolia (334,100 sq.mi.) is much more thickly settled because it contains industrial, agricultural and mining regions, together with the vast stretches of grazing land which are characteristic of all Mongolia. In contrast to the settled Chinese farmer, the Mongol is usually a pastoral nomad and almost all the wealth of the various Mongol clans or "banners" is in their herds and flocks.

**Outer Mongolia.**—Population (est. 1941), 850,000. Capital, Ulan Bator (formerly Urga) (100,000). This immense country had been almost completely cut off from the outside world (apart from the U.S.S.R.) from 1921, when soviet troops, pursuing the anti-soviet forces of Baron Ungern-Sternberg in a concluding phase of the civil war in eastern Siberia, entered Outer Mongolia and made it possible for Mongol revolutionaries to set up a regime in Outer Mongolia which called itself a People's republic. Outer Mongolia appeared on maps as part of China, although the authority of the Chinese central government was somewhat limited and Russian political and commercial influence was strong before the Revolution.

After 1921, however, the exclusion of Chinese and other foreign trade and influence was complete and from that time Outer Mongolia was one of the least visited regions in the world by foreigners, with the exception of soviet Russians. When the U.S.S.R. resumed diplomatic relations with China in 1924 the soviet government recognized Outer Mongolia as an integral part of China and promised to withdraw its troops. But it never proved feasible for China to send officials there, even on a mission of investigation, and close politico-military co-operation prevailed between the soviet and Outer Mongolian governments.

A treaty of military alliance between the U.S.S.R. and Outer Mongolia was concluded in 1936. Japanese and soviet troops, along with Outer Mongolians and Manchoukuo units, were involved in a number of border clashes along the ill-defined Manchuria-Mongolia frontier during the 1930s. The most serious of these was at Nomonhan in 1939 and apparently ended in a severe Japanese reverse because of the efficiency of the soviet armoured units.

China consented to renounce its claim to sovereignty over Outer Mongolia in the event that a plebiscite in that country should reveal a majority in favour of union with the U.S.S.R. This agreement was embodied in the soviet-Chinese treaty of Aug. 1945. The plebiscite was subsequently held and the official result was a vote of 483,291, without a dissenting vote being cast, in favour of union with the U.S.S.R.

Politically and economically Outer Mongolia had been under strong soviet influence. A number of young Mongols were regularly sent to the U.S.S.R. for technical training. There were reports of Mongol units serving in the soviet armies in Europe; but it was not clear whether these units were recruited in

Outer Mongolia or in Buryat-Mongolia, an autonomous republic in eastern Siberia.

**Economic Characteristics.**—Russian experts helped to organize the financial system of the country. The unit of currency is the tugrik, valued at 90 kopeks. Outer Mongolia remained predominantly a pastoral country, although there were a few industrial enterprises, including a brick factory and an electric power station at Ulan Bator. In 1942 there were 1,340,000 horses, 270,000 camels, 1,500,000 oxen and 10,600,000 sheep in the country.

Ulan Bator is connected with the U.S.S.R. by means of a radio station and an air line which functions between the Mongolian capital and Verkhne-Udinsk, in eastern Siberia. There is a highway from Ulan Bator to the Siberian border town of Kyakhta; but there are no railways in Outer Mongolia. The foreign trade of Outer Mongolia is directed entirely toward the soviet union and is largely composed of an exchange of Outer Mongolian pastoral products, meat, wool, hides, bristles and casings, for such soviet products as oil, chemicals, cement, textiles and manufactured goods. There is steamer transportation on the Orkhon and Selenga rivers.

Northwest of Outer Mongolia is the little soviet protectorate of Tannu-Tuva, area 64,000 sq.mi., pop. 65,000, capital Kysylchoto. Its communication with Siberia is by way of the Yenisei river, which rises in Outer Mongolia.

**Inner Mongolia.**—Inner Mongolia includes the three northern Chinese provinces of Chahar, Suiyuan and Ningsia (Sitao). The population is more mixed than is the case in Outer Mongolia and the area is economically more developed and served by the Peking-Suiyuan railway. Mongols predominate in the grazing areas and Chinese in the towns and in farming regions along the line of the railway.

The surrender of Japan in Aug. 1945 brought important changes to Inner Mongolia. Chinese sovereignty in this area was suspended after the Japanese military occupation in 1937. The Japanese detached Inner Mongolia administratively from the rest of North China and sponsored the creation of a so-called new state, Mengchiang (Federated Council of the Mongol Borderland). There were three subdivisions of this state, with local capitals in Hohohoto (formerly Suiyuan), Kalgan and Tatung. The regime at Hohohoto is predominantly Mongol.

Tatung is the largest town in North Shansi and the centre of a big inadequately developed coal region. Kalgan is an old trading town northwest of Peking. Nearby are extensive iron deposits. Immediately after the collapse of Japan, Chinese communist forces moved into Inner Mongolia and gained control of Kalgan, the largest town which had fallen under communist rule up to the close of 1945. The attitude of the Mongols, who always possessed a good deal of local autonomy, was not clear. There was a certain amount of fighting between communists, central government troops and other forces in Inner Mongolia; but the administrative situation at the end of 1945 was still very obscure.

The population of Inner Mongolia is roughly estimated at from 5,000,000 to 7,000,000. Principal products of the area are wool, furs, coal, iron, opium, cereals and linseed. (W. H. CH.)

**Montana.** A northwestern state of the United States, popularly known as the "Treasure state." Area, 147,138 sq.mi.; pop. (1940): 559,456. The urban population was 211,535 or 37.8%. Capital, Helena (15,056). Other cities of 10,000 or more were: Butte (37,081); Great Falls (29,928); Billings (23,261); Missoula (18,449); Anaconda (11,004). It was estimated that the population of the state had gone up 40,000 or 50,000 after 1944 (est. 464,999 as of July 1, 1944). Of the total population there were 540,468 whites (1940), of whom 484,826 were native-born and 55,642 were foreign-born.

The Indian population numbered 16,841.

**History.**—The principal state officers in 1945 were Sam C. Ford (Rep.), governor; Ernest T. Eaton (Rep.), lieutenant governor; Sam W. Mitchell (Dem.), secretary of state; R. V. Bottomly (Dem.), attorney-general; George T. Porter (Rep.), treasurer; John J. Holmes (Dem.), auditor; Elizabeth Ireland (Rep.), superintendent of public instruction; and Horace F. Casey (Dem.), railroad and public service commissioner. Congressman James F. O'Connor died early in 1945 and at a special election in June, Wesley A. D'Ewart (Rep.), one of the leading opponents in the state to a Missouri Valley authority, was elected for the unexpired term.

**Education.**—There were 1,534 elementary schools in Montana in 1945, with an enrolment of 66,303 and a teaching staff of 3,401. There were 190 high schools with 24,605 students and 1,307 teachers. The net amount spent on the operation of these schools was \$13,941,463.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Through federal and state aid, approximately 17,500 persons received public assistance in 1945. Grants totaling \$5,414,295 were distributed as follows (figures in parentheses indicate the average number of recipients per month): Old age assistance (10,754), \$4,021,218; aid to dependent children (4,553), \$662,492; aid to needy blind (322), \$131,181; subsistence (1,056), \$316,472; medical care (257), \$43,466; hospitalization (308), \$214,392; burials (31), \$25,074. Unemployment benefits of \$73,431—about 23% less than the amount for 1944—were paid to 765 persons, an average of \$12.39 per week for 7.75 weeks, or \$96 per claimant. Correctional institutions with their average populations and total expenditures in 1945 were: Montana State prison, 325 inmates, \$126,000; State Industrial school, 86 inmates, \$70,509; Vocational School for Girls, 77 inmates, \$44,949.

**Communications.**—In 1945 the state highway commission maintained 7,963 mi. of highways, of which 1,070 mi. were unsurfaced. State highway expenditures in 1945 were \$5,466,143, including federal aid. On June 5, the electorate approved a \$12,000,000 highway debenture issue of bonds for Montana's participation in the federal-aid highway building program. There were 106 designated airports, of which 26 were suitable for large commercial or military aircraft. The railway mileage was approximately 5,203 mi. The number of telephones was estimated at 78,841.

**Banking and Finance.**—There were 130 banks in the state in 1945. The 40 national banks had total deposits of \$213,024,000, and their total assets were \$223,638,000. State banks had total deposits of \$199,919,556, and their total assets were \$209,511,829. There were 16 building and loan associations with assets of \$14,156,662. The state government, with a general fund balance of \$925,000 after setting aside \$4,500,000 for a postwar reconstruction program, was in excellent financial condition. For the fiscal year 1944-45, the net state income was \$32,904,451 and the total expenditures \$27,263,277. The gross debt of the state on July 1, 1945, was \$7,331,000 and the net debt, \$4,925,129.

**Agriculture.**—Most Montana crop yields were reduced in 1945 owing to less favourable weather conditions. The value of

Table 1.—Leading Agricultural Products of Montana, 1945 and 1944

Crop	1945	1944
Wheat, bu. . . . .	57,726,000	74,764,000
Hay, tons . . . . .	2,487,000	2,433,000
Barley, bu. . . . .	13,248,000	16,290,000
Oats, bu. . . . .	9,486,000	15,717,000
Sugar beets, tons . . . . .	877,000	682,000
Flaxseed, bu. . . . .	1,410,000	1,453,000
Corn, bu. . . . .	2,010,000	2,940,000
Potatoes, bu. . . . .	2,016,000	2,520,000
Alfalfa seed, bu. . . . .	88,000	84,000
Seed peas, 100 lb. bags . . . . .	288,000	414,000
Dry beans, 100 lb. bags . . . . .	200,000	250,000
Mustard seed, lb. . . . .	25,200,000	22,000,000

all main crops was \$154,803,000 as compared with \$179,822,000 in 1944. Cash income from livestock and livestock products was estimated to be in excess of \$150,000,000.

**Manufacturing.**—The total value of products manufactured in Montana in 1939 was \$151,885,026 as compared with \$176,278,814 in 1937. Persons employed in manufacturing numbered 10,898 in 1939 and were paid salaries and wages amounting to \$15,832,241.

Table II.—Industrial Products in Montana, 1944 and 1943

Products	1944	1943
Cheese, lb.. . . . .	3,940,502	2,147,234
Butter, lb. . . . .	11,807,544	12,731,782
Powdered milk, lb. . . . .	44,000	49,773
Ice cream, gal. . . . .	1,455,590	1,414,730
Beet sugar, tons. . . . .	109,000	104,000
Flour, sacks . . . . .	2,946,559	2,770,604
Mill feed, lb. . . . .	110,900,405	98,377,446
Beer, bbl. . . . .	251,912	219,592

**Mineral Production.**—The value of the 1945 production of gold, silver, copper, lead and zinc in Montana was \$39,134,900, a decrease of 20% under that of 1944. The shortage of labour in the mines, mills and smelters was the most acute experienced up

Table III.—Principal Mineral Products of Montana, 1945 and 1944

Mineral	Value, 1945	Value, 1944
Copper . . . . .	\$24,616,000	\$31,911,300
Zinc . . . . .	6,440,000	8,236,956
Silver . . . . .	4,422,400	5,044,064
Lead . . . . .	2,064,000	2,096,800
Gold . . . . .	1,592,500	1,693,650
Total . . . . .	\$39,134,900	\$49,039,855

to 1945. There was some increased activity in Montana gold mines following the rescinding on July 1, 1945, of the War Production board's gold mine closing order of Oct. 8, 1942.

Crude oil production amounted to approximately 8,416,000 bbl. in 1945, somewhat less than for 1944. (E. E. B.)

**Montenegro:** see YUGOSLAVIA.

**Montgomery, Sir Bernard Law** (1887— ), British army officer, was born Nov. 16. The son of an Ulster clergyman, he joined the Royal Warwickshire regiment as a second lieutenant in 1908, and fought in France during World War I. A month before the outbreak of World War II, in Aug. 1939, he was appointed to command the third division which went to France with the B.E.F., and helped evacuate his troops from Dunkirk in June 1940. In the summer of 1942, Lt. Gen. Montgomery was made commander of the British 8th army. Under "Monty's" leadership, the 8th army turned back the Afrika Korps at El Alamein in Oct. 1942, and chased Rommel into Tunisia. On Feb. 11, 1943, Montgomery's forces were placed under Gen. Dwight D. Eisenhower's unified command. Montgomery played a major role in the conquest of Tunisia, the landings in Sicily and in the Italian campaign. During the early phase of the invasion of France, Montgomery was field commander of Allied ground forces. On Aug. 30, 1944, Eisenhower split his land forces into two groups, with Montgomery commanding the 21st army group (mostly British imperial troops), and with Gen. Omar Bradley heading the 12th (predominantly U.S.) army group. The following day, Aug. 31, King George VI appointed Montgomery field marshal supernumerary.

During the German counterattack in the Ardennes forest, the U.S. 1st and 9th armies were transferred (Dec. 20, 1944) to Montgomery's command. They were returned to Gen. Bradley's jurisdiction after the German bulge was ironed out. Montgomery's forces drove through the Netherlands, northern Germany and up to Denmark in the closing phases of the battle for Germany, and on May 4, 1945, all German forces in that area surrendered to his armies. Montgomery was appointed chief of the

British occupation forces and British member of the Allied Control commission in Germany, May 22, 1945.

**Montreal.** A city in the province of Quebec, Canada, first called Ville Marie, founded in 1642 on the site of the Indian village of Hochelaga, Montreal is on an island at the confluence of the Ottawa and St. Lawrence rivers, approximately 1,000 mi. from the Atlantic ocean and 2,760 mi. from Liverpool. Being at the head of ocean navigation, it is the terminus for lake vessels from the Great Lakes and is served by three canal systems—the St. Lawrence canals (1,230 mi. to the Great Lakes), the eastern United States canals, via the Richelieu river and Lake Champlain (length 127 mi.) and the Ottawa river canals (length 119 mi.).

The population of the city proper in 1945, as estimated by *Lovell's Directory*, was 1,345,605, and of greater Montreal 1,554,261.

The city is governed by a mayor and a council of 99 members, of whom one-third are appointed by public bodies, one-third elected by the property owners and one-third by the citizens generally. The mayor is elected by the citizens. The council appoints from among its members six councillors to act as an executive committee. Greater Montreal is supervised by the metropolitan commission, on which the city and suburban municipalities are represented.

The port of Montreal is the largest in Canada. Deep-sea-vessel arrivals in 1945 numbered 601, with a net tonnage of 2,231,232. The number of coastal- or inland-vessel arrivals in 1945 was 217, with a net tonnage of 201,780.

The assessed value of real estate, as of April 30, 1945, was \$1,278,204,636, of which \$346,566,674 was exempt from taxation.

In 1945 building permits were issued for 1,934 new projects, having a value of \$16,532,935, and for 2,425 repair jobs, having a value of \$5,370,913.

Bank debits (for 11 months ended Nov. 30, 1945) were \$15,834,667,688. (J. A. MA.)

**Montserrat:** see WEST INDIES, BRITISH.

**Mooney, Edward** (1882— ) cardinal archbishop of Detroit, was born at Mt. Savage, Md., on May 9. He was ordained in 1909. After serving for three years as spiritual director of the North American college in Rome, he was elected titular archbishop of Irenopolis Jan. 1926, and was named apostolic delegate to India. First U.S. priest to be given a permanent appointment in the diplomatic service of the holy see, he was later transferred to Japan in the same capacity of delegate. An outstanding accomplishment of his five years as delegate to India was the settlement of the so-called "double jurisdiction" question, effected through an accord between the holy see and Portugal.

He was installed bishop of Rochester, Oct. 12, 1933. He was also elected chairman of the Administrative Board of National Catholic Welfare conference in Nov. 1935, a post which he held, with the exception of one year, until Nov. 1945.

On June 1, 1937, following the death of Bishop Michael J. Gallagher early in that year, the announcement came from Vatican City that the diocese of Detroit had been elevated to the rank of an archiepiscopal see, that the entire state of Michigan had been made into a new ecclesiastical province, and that Archbishop Mooney had been named its first archbishop.

An ardent supporter of the labouring man, he formed the Association of Catholic Trade Unionists in Detroit and became a powerful factor in counteracting communist influence in the unions and in promoting responsible unionism.

An announcement of Dec. 23, 1945, revealed that he had been elected to the Sacred College of Cardinals. He was created and proclaimed cardinal at consistory Feb. 18, 1946.

**Mormons.** On May 14, 1945, Heber Jeddy Grant (*q.v.*), president of the Church of Jesus Christ of Latter-day Saints, passed away.

On May 21, 1945, Elder George Albert Smith, at the time president of the Council of the Twelve, was chosen and set apart, at a meeting of the Council of the Twelve Apostles, as successor to President Grant.

President George F. Richards was, at the same time, chosen and set apart as the president of the Council of the Twelve.

At the death of the president of the church, the Council of the Twelve Apostles becomes the governing body of the church and the depository of all of the powers and authorities incident thereto, and the council continues to possess and to exercise such powers and authorities until a new president is chosen and set apart, who then receives, by ordination at the hands of the Twelve, all the powers, authorities and keys incident to the presidency of the high priesthood of the church. Thereafter the Council of the Twelve again becomes the second governing body, or quorum, of the church. The new president is then accepted and sustained by the body of the church, in solemn assembly, as president of the church, and as prophet, seer and revelator thereto.

George Albert Smith was born in Salt Lake City, Utah, on April 4, 1870. His father was an apostle for 29 years and counsellor to President Joseph F. Smith, who preceded Heber J. Grant as president of the church. His grandfather, also George Albert Smith, was an apostle and counsellor to Brigham Young.

Before his ordination to the apostleship on Oct. 6, 1903, at the age of 33 years, George Albert Smith had been active in business, civic and political circles. He continued active in civic affairs, being vice-president, then president, of the International Irrigation congress. He served as president of the International Dry Farming congress and later as president of the Combined Irrigation and Farm congress in Kansas City, Mo., in 1918. He was president of the European mission of the church, 1919-21. For many years he was prominently identified with the Boy Scouts of America, being a member of the national executive council and receiving the Silver Buffalo award from that organization for his outstanding and meritorious service to boyhood. He was also prominent in the Sons of the American Revolution, being twice elected national vice-director general. He actively promoted the work of the Utah Pioneer Trails and Landmarks association. (See also CHURCH MEMBERSHIP.) (J. R. CL.)

**Morocco:** see FRENCH COLONIAL EMPIRE; SPANISH COLONIAL EMPIRE.

**Morrison, Herbert Stanley** (1888- ), British statesman, was born at Brixton, London, Jan. 3, 1888. Having left elementary school at 14, he passed through a variety of jobs. From 1913 onward he took up politics as a full-time occupation, first as a journalist, later as secretary to the London Labour party. After a year as mayor of Hackney (1919-20) he was elected, in 1922, to the London county council which remained the main sphere of his activities and influence for 18 years. Having been a member of parliament during 1923-25, 1929-31, and from 1935 onward, and minister of transport in the second Labour government, he became, in May 1940, one of the three Labour members of the Churchill coalition government, first as minister of supply, and from Oct. 1940 as home secretary and minister of home security, offices which he held until the breakup of the

coalition government in May 1945, from 1941 as a member of the war cabinet. As a member of the Labour party executive and chairman of the Labour party election campaign committee he could take some of the credit for organizing the sweeping victory of his party in the general election of July 1945. In the new Labour government he held in 1945 a prominent position as leader of the house of commons and lord president of the council (in which capacity he was expected to be in charge of the general co-ordination of economic policy). In November he laid before the house of commons the Labour government's legislative plans for the nationalization of the inland transport and fuel and power industries. (H. W. AT.)

**Mortgages, Farm:** see AGRICULTURE; FARM CREDIT ADMINISTRATION.

**Mortgages, Home:** see HOUSING.

**Moscow.** With victory approaching, Moscow continued, in the early part of 1945, to be an ever-growing centre of attraction to civilians from all parts of the soviet union, and especially for officers and soldiers on leave. The partial blackout was completely lifted on April 30. The series of almost nightly victory salutes, with their coloured rockets, and culminating in the tremendous fireworks of victory night on May 9, added ideologically and sentimentally to the glamour of Moscow and to its symbolic significance as the heart of the soviet union. On victory night 2,000,000 to 3,000,000 people were estimated to have thronged central Moscow. There were many spontaneous pro-Ally demonstrations, notably outside the U.S. embassy. On May 1, the day before the fall of Berlin, a large military parade was held in the Red square. Here also a victory parade was held, in Stalin's presence, on June 24.

For a variety of reasons the population of Moscow continued to increase, and was unofficially estimated at 5,500,000 to 6,000,000 in 1945, as against 4,137,018 in 1939. Housing and transportation were very severely overcrowded, but apart from some typhus and an increase in social diseases, health was reasonably good. Food and fuel continued to improve, and undernourishment, common in 1942 and 1943, practically disappeared. After V-E day the usual seasonal wartime mobilization of about 250,000 civilians for cutting peat and timber for Moscow's wartime needs was stopped. Overtime was stopped in industry, holidays were allowed, and production in many cases was converted to civilian goods, notably in the great Moscow textile industry. Consumers' goods became more plentiful and cheaper. Large plans existed for rebuilding and extending Moscow, but these awaited large-scale demobilization. From July many thousands of demobilized soldiers of the older age-groups who arrived in, or passed through, Moscow were lavishly entertained.

In the summer the Allied reparations commission met in Moscow, and also a congress of Allied scientists, in connection with the 220th anniversary of the soviet academy of sciences. The summer of 1945 was exceptionally rainy, and crops in the Moscow province, except potatoes, were bad. (A. WH.)

## Moscow Conference of Foreign Ministers.

At the Berlin conference which ended Aug. 2, 1945, the heads of the governments of Great Britain, the soviet union and the United States decided to establish a Council of Foreign Ministers of the three powers and, in addition, of China and France. This council would convene in a series of foreign ministers' conferences to resolve international problems. (See BERLIN CONFERENCE.)

The first session of the Council of Foreign Ministers met accordingly in London in Sept. 1945 but it ended in a stalemate between the U.S.

and Britain on the one side and Russia on the other. Some progress was made in the draft of a peace treaty with Italy, but on other points there was disagreement. The rupture came, however, on a question of procedure. On Sept. 11 the Russians agreed that all five powers should be present at all meetings. But on Sept. 22 the Russians insisted on the exclusion of France and China from the discussion of the peace treaties (except that France was to participate in the treaty with Italy). To this the other two foreign ministers would not agree, and there the conference ended.

To break the stalemate, Secretary Byrnes proposed a conference of the foreign ministers of Great Britain, the Soviet Union and the United States to be held in Moscow. The conference met accordingly from Dec. 16 to Dec. 26, 1945. The Russians were willing to make some concessions to U.S. interests in the far east, but they remained adamant in the middle east where primarily British interests were at stake. On other points a formal agreement was reached, though its implementation might still give rise to various interpretations.

It was agreed that the peace treaties with the former German satellites should be drawn up only by those members of the Council of Foreign Ministers who signed the surrender terms of the country in question. The completed drafts were to be submitted to a conference on which the Big Five and all United Nations which actively waged war with substantial force against European enemy states would be represented. This conference was to be held not later than May 1, 1946. Its recommendations would be considered in drawing up the final peace treaties by the states signatory to the terms of the armistice.

In regard to the far east, it was decided to replace the Far Eastern Advisory Commission with a Far Eastern Commission consisting of the Soviet Union, Great Britain, the United States, China, France, the Netherlands, Canada, Australia, New Zealand, India and the Philippines. This commission was to formulate the policies and principles for Japan. The U.S. government would formulate its directives in accordance with these policies and principles and would transmit them to the supreme commander who would implement them. The commission would have its headquarters in Washington. In addition there was to be an Allied Council in Tokyo under the chairmanship of the supreme commander and including in addition a Russian, a Chinese and a British commonwealth member. It would meet not less often than once every two weeks to consult with and advise the supreme commander regarding the control of Japan.

Korea, it was decided, should be put under a provisional democratic Korean government and put under a joint trusteeship of Great Britain, China, the Soviet Union and the United States for a period of up to five years to prepare the country for national independence.

With regard to Rumania, it was decided that the representatives of the three powers should visit Rumania and satisfy themselves that two truly representative and suitable members of the National Peasant Party and of the Liberal Party were included into the government, which should declare as soon as possible free and unfettered elections and should guarantee the freedom of the press, speech, religion and association. In Bulgaria the Soviet government undertook to give friendly advice to the Bulgarian government to include two representatives of democratic parties which were not represented in 1945 in the fatherland front government.

An important decision was taken, as a result of the U.S.-British-Canadian agreement on atomic energy control, for the establishment, by the general assembly of the United Nations, of a commission for the control of atomic energy. This commission, composed of representatives of the states represented in the Security Council plus Canada, would submit its reports and recommendations to the Security Council which also would issue directives to the commission. The commission would discuss and submit proposals for extending between all nations the exchange of basic scientific information for peaceful ends; for the control of atomic energy to the extent necessary to ensure its use only for peaceful purposes; for the elimination of atomic weapons and of all major weapons for mass destruction; and for effective safeguards of inspection against violations and evasions.

**Motion Pictures.** The year 1945 was a turbulent one in the U.S. motion picture industry, with the producing studios torn for more than eight months by a jurisdictional strike. From a box-office standpoint, it was estimated that 1945 surpassed even the record figure of 1944. Production costs, both for labour and materials, stood at new highs. The end of World War II was followed by termination of government censorship and film rationing.

In 1945 Eric A. Johnston, president of the U.S. Chamber of Commerce, became president of the Motion Picture Producers and Distributors of America. Will Hays, who had been its head from its formation in 1922, his long tenure giving rise to the popular designation of "the Hays office," remained in an advisory capacity. Soon after Johnston's accession, Warner Bros., which had withdrawn in 1944, returned to membership in both the M.P.P.D.A. and the Association of Motion Picture Producers in Hollywood. Early in December, both these organizations were merged under Johnston's leadership, with the title of Motion Picture Association of America. Byron Price, who had been director of government censorship during the war, became vice-president in charge of Hollywood activities. Another national

FIGURE in a mob scene from *Ivan the Terrible*, Soviet film pageant in three parts, produced by Sergei Eisenstein and shown in the Soviet Union in 1945. Emphasis was placed less on the czar's reign of terror than on his role in unifying all the Russians

figure, Donald M. Nelson, who had been chairman of the War Production Board, became president of the Society of Independent Motion Picture Producers.

The year 1945 saw the slow beginning of motion picture distribution by U.S. companies in countries formerly occupied by the Germans, such as France and Italy. The foreign market situation differed from country to country, variously complicated by such factors as quota systems, depreciated currency, frozen funds, taxation and nationalization of motion picture industries. The rule was to re-establish distribution and leave to the future the matter of financial return. U.S. firms did not operate in Russian spheres of influence. Outside Europe generally, the foreign situation showed little change.

The U.S. film industry in 1945 organized the Motion Picture Export Association, headed by Eric A. Johnston. Its primary purpose was to look after U.S. interests in regions where a free economy did not prevail.

J. Arthur Rank, the English motion picture executive, visited

Hollywood in 1945, and his activities loomed large in the U.S. film industry. Regarded as the most important of his deals involving Hollywood was the announced affiliation, late in the year, of Rank, Universal and International (William Goetz and Leo Spitz) in a world-wide organization, United World Pictures company. Plans called for reciprocal showings of U.S. and British produced pictures, with interchange of talent in production. This was followed by announcement of a similar world-wide distribution set up by Rank and Pathe industries, which controlled Producers Releasing corporation (PRC).

The long-expected government antitrust action involving eight motion picture companies went to trial in the U.S. district court in New York city before Circuit Judge Augustus N. Hand and District Judges Henry W. Goddard and John Bright. Generally, the charges concerned asserted monopoly through control of theatres, and various asserted trade practices tending to create a virtual monopoly. The defendants were Paramount, Loew's (Metro-Goldwyn-Mayer), 20th Century-Fox, RKO, Warner Bros., Columbia, United Artists and Universal, with the three last-named exempt from the charges of theatre control. The trial went into 1946 for final arguments.

The house of representatives committee on immigration and naturalization conducted hearings on the extent of alien employment in the industry. Chairman Samuel Dickstein (Democrat, New York) later reported that the number of aliens, including actors, was only slightly more than 1%.

Tabulation of the industry's war record showed that the Hollywood Victory committee had set up 55,619 free appearances by stars and other performers in behalf of the war effort, entertaining servicemen, aiding war bond sales and other activities. Celebrities had made 122 overseas tours, 151 hospital tours, 254 camp tours and 41 bond tours. The Hollywood Canteen closed after having entertained 3,000,000 servicemen and women. The War Activities committee of the industry had donated 43,306 16-mm. prints of feature pictures and 33,326 prints of short subjects to the Army Pictorial service for overseas distribution.

Among the prominent names in the industry returning from service with the armed forces were Louis Hayward, Richard Greene, John Howard, Victor Mature, John Payne, James Stewart, Clark Gable, Robert Montgomery, Henry Fonda, Tyrone Power, Cesar Romero, William Holden, William Lundigan, John Carroll, Ronald Reagan, Jean Pierre Aumont, Van Heflin, Gene Raymond, Buddy Rogers, Gene Autry, Lew Ayres, Bruce Cabot, Jackie Coogan, Wayne Morris. A tabulation at the end of the year showed a total of 2,750 men and women in service who had returned to their jobs at the various studios.

Emphasis in 1945 naturally was on "escapist" pictures, with war topics sharply receding. Musicals were again to the fore, as were comedies and mysteries, the latter running importantly to psychological themes. In the religious field, *The Bells of St. Mary's*, released toward the year's end, promised to repeat the success of *The Song of Bernadette* and *Going My Way* of the two preceding years.

The capital investment of the industry in 1945 continued at:

Theatres . . . . .	\$1,900,000,000
Studios . . . . .	125,000,000
Distribution . . . . .	25,000,000
	\$2,050,000,000

The year 1945 was outstanding in the development of important new screen personalities, which included Jeanne Crain, Peter Lawford, June Haver, Angela Lansbury, Dane Clark, Elizabeth Scott, Lawrence Tierney and Yvonne De Carlo.

The outstanding pictures of the year were: *Spellbound*, *Anchors Aweigh*, *Saratoga Trunk*, *Valley of Decision*, *Wonder*

*Man*, *The Dolly Sisters*, *A Tree Grows in Brooklyn*, *Love Letters*, *Mildred Pierce*, *Incendiary Blonde*, *State Fair*, *House on 92nd Street*, *Rhapsody in Blue*, *The Clock*, *Kiss and Tell*, *Enchanted Cottage*, *Over 21*, *A Song To Remember*, *Those Endearing Young Charms*, *Objective Burma*, *Our Vines Have Tender Grapes*, *Pride of the Marines*, *Picture of Dorian Gray*, *Murder*, *My Sweet* and *A Medal For Benny*.

One of the most controversial pictures of the year was *Dillinger*. It cost less than \$150,000 to make, but at latest report was expected to gross more than \$3,000,000. This was the biggest "small" picture of the year and caused considerable controversy about gangster pictures.

With the war's end, imports of foreign pictures began to increase. During the first 11 months of 1945, the Production Code administration approved 23 foreign pictures, as against 12 for the corresponding period in 1944. Perhaps the most important of the imports were two of J. Arthur Rank's British productions, *Colonel Blimp* and *Blithe Spirit*, and a Swiss picture *The Last Chance*.

Jean Hersholt became president of the Academy of Motion Picture Arts and Sciences, succeeding Walter Wanger.

The *Motion Picture Herald* annual poll showed the following stars as the leading box-office attractions in 1945. Bing Crosby again headed the list as the top money-maker:

- |                  |  |
|------------------|--|
| 1. Bing Crosby   | 6. Humphrey Bogart and Gary Cooper (tie) |
| 2. Van Johnson   | 7. Bob Hope                              |
| 3. Greer Garson  | 8. Judy Garland                          |
| 4. Betty Grable  | 9. Margaret O'Brien                      |
| 5. Spencer Tracy | 10. Roy Rogers                           |

**Awards.**—Academy of Motion Picture Arts and Sciences awards for 1944:

Irving G. Thalberg Memorial Award, for most consistent high quality production achievement by an individual producer, Darryl F. Zanuck; best picture, *Going My Way*, Paramount; performances: actor, Bing Crosby in *Going My Way*; actress, Ingrid Bergman in *Gaslight*, Metro-Goldwyn-Mayer; supporting actor, Barry Fitzgerald in *Going My Way*; supporting actress, Ethel Barrymore in *None But the Lonely Heart*, RKO; best direction, Leo McCarey for *Going My Way*; best written screen play, Frank Butler and Frank Cavett for *Going My Way*; best original screen play, Lamar Trotti for *Wilson*, 20th Century-Fox; best original motion picture story, Leo McCarey for *Going My Way*; best art direction—black and white—Cedric Gibbons and William Ferrari for *Gaslight*; colour, Ward Ihnen for *Wilson*; best cinematography—black and white—Joseph LaSelle for *Laura*, 20th Century-Fox; colour, Leon Shamroy for *Wilson*; best sound recording, E. H. Hansen for *Wilson*; short subjects—cartoon, *Mouse Trouble*, Metro-Goldwyn-Mayer (Frederick C. Quimby, producer); one-reeler, *Who's Who in Animal Land*, Paramount (Jerry Fairbanks, producer); two-reeler, *I Won't Play*, Warner Bros. (Gordon Hollingshead, producer); best film editing, Barbara McLean for *Wilson*; best scoring of a musical picture, Morris Stoloff and Carmen Dragon for *Cover Girl*, Columbia; best scoring of a dramatic picture, Max Steiner for *Since You Went Away*, Selznick International; best song, "Swinging on a Star," from *Going My Way* (music by James Van Heusen, lyrics by Johnny Burke); best special effects, *Thirty Seconds Over Tokyo*, Metro-Goldwyn-Mayer (A. Arnold Gillespie, Donald Jahraus and Warren Newcombe for photography; Douglas Shearer for sound); best interior decoration—black and white, Edwin B. Willis and Paul Huldscrinsky for *Gaslight*; colour, Thomas Little for *Wilson*; documentaries—feature, *The Fighting Lady*, 20th Century-Fox and U.S. navy; short subject, *With the Marines at Tarawa*, U.S. marine corps; special award, Bob Hope, for his many services to the academy; Margaret O'Brien, outstanding child actress of 1944. (L. O. P.)

To Alexander Knox for his role in *Wilson* went the award for the best performance of an actor in 1945, as judged by U.S. motion picture critics in a nation-wide poll. Ingrid Bergman for *Spellbound* and Greer Garson for *Valley of Decision* were tied for the best actress' performance during the year. Other outstanding male stars chosen by the critics, according to *The Film Daily*, were Gregory Peck for *The Keys of the Kingdom*, Burgess Meredith for *The Story of G.I. Joe*, Gregory Peck, again, for *The Valley of Decision*, with a tie for fifth place among Joseph Cotten for *Love Letters*, James Dunn for *A Tree Grows in Brooklyn* and Cary Grant for *None But the Lonely Heart*. Actresses named after those tied for first place were Joan Crawford for *Mildred Pierce*, Bette Davis for *The Corn is Green* and Greer Garson, again, for *Mrs. Parkington*. Those voted the best supporting actors and actresses for the year were Clifton Webb in *Laura*, J. Carol Naish in *A Medal For Benny*, Robert Mitchum in *The Story of G.I. Joe*, John Dall in *The Corn is Green*, Keenan Wynn in *Without Love*, Ann Revere in *National Velvet*, Joan Blondell in *A Tree Grows in Brooklyn*, Ethel Barrymore in *None But the Lonely Heart*, Joan Loring in *The Corn is Green* and Ann Blyth in *Mildred Pierce*. The critics' choice of outstanding screen plays were *Wilson*, *Laura*, *The Story of G.I. Joe*, *Love Letters* and *A Tree Grows in Brooklyn*, the last two being tied. Lauren Bacall, Elizabeth Scott, John Dall, Gregory Peck and Cornel Wilde were judged the talent "finds" of the year. (X.)

Above: ANGELA LANSBURY and HURD HATFIELD in a scene from *The Picture of Dorian Gray*, which was given an award by the Academy of Motion Picture Arts and Sciences for the best cinematography of 1945 in the black and white class

Above, right: JOAN CRAWFORD in the title role of *Mildred Pierce*, which won for her the 1945 award of the Academy of Motion Picture Arts and Sciences for the best actress

Right: RAY MILLAND was named the best actor of 1945 by the Academy of Motion Picture Arts and Sciences for his role as a drunkard in *The Lost Weekend*, which was chosen the best picture of the year. Other honours awarded the picture were those for best direction, by Billy Wilder, and for the best written screen play

Below, left: JAMES DUNN (right) in a scene from *A Tree Grows in Brooklyn*. He was named the best supporting actor of 1945 by the Academy of Motion Picture Arts and Sciences. Peggy Ann Garner (second right) was given a special award as the outstanding child actress of the year

Below, right: ANNE REVERE (right), for her performance in *National Velvet*, was named the best supporting actress of 1945 by the Academy of Motion Picture Arts and Sciences

**Technical Developments.**—The termination of hostilities in Europe and the Pacific came too late to permit equipment companies and industry engineers to do much in the way of new development.

**Standards.**—Forty-nine U.S. war standards were adopted by the War Committee on Photography and Cinematography in order to facilitate the design, procurement, operation, maintenance and interchangeability of motion picture equipment. Sixteen of these standards were turned over to the American Standards association as proposed peace-time standards. The remainder of the war standards were expected to be considered and turned over to the A.S.A. as rapidly as possible.

**Sixteen Millimetre Film.**—The impetus given to 16-mm. picture production and exhibition through the widespread use of this medium by the military forces, both for training and entertainment purposes, had begun to show its effect even before the close of World War II. Producers of 35-mm. entertainment films continued their plans for 16-mm. releases of their regular 35-mm. pictures. Some planned to enter the educational field and others planned to enter the industrial or advertising motion picture field. Equipment companies formerly interested only in 35-mm. professional camera, sound recording and projection equipment, prepared to supply professional 16-mm. equipment. A few feature-length entertainment films were photographed in 16-mm. colour and produced for 16-mm. release only. Future plans called for considerably more production of this type. It appeared that the early stages of a 16-mm. motion picture industry were developing; while the 16-mm. probably would always supplement the 35-mm. industry, it might nevertheless, grow to comparable importance.

**Colour.**—Insofar as commercial use of colour in the industry was concerned, there were no new developments. All film manufacturers were believed to be working on new or improved colour processes. Considerable interest was shown in a picture produced in Germany during the war, in which a colour process developed by Agfa was used, that was believed to be a negative-positive process. This process was being thoroughly investigated by various branches of the motion picture industry and might be placed in commercial use in the United States if it revealed advantages over existing processes. A commercial pilot laboratory for the processing of 35-mm. and 16-mm. Ansco colour reversal film was being constructed in Hollywood. This laboratory was to be completed in the early part of 1946 and was expected to contribute much information regarding the commercial use of the Ansco reversal process.

The new colour films, unlike the previous Technicolor process, resulted in a sound track with high transparency in the infra-red range. Since photoelectric cells which were in use for sound reproduction in theatres had their maximum sensitivity in the red and infra-red range, such sound tracks presented a new problem. As a solution to this problem, the industry was considering the use of a different photoelectric cell having its maximum sensitivity in the blue range. It was believed that these new blue-sensitive photocells would reproduce satisfactorily either the existing silver image sound tracks, or the dye-type sound tracks encountered in several of the colour processes.

**Sound.**—Republic studio completed, and placed in operation, a music-recording stage which was perhaps the largest and finest in the industry. It was designed to accommodate orchestras of 100 or more men and to provide a separate vocal room to permit isolation of the vocalist from the orchestra.

Various studios, including RKO, Republic and Disney, constructed and were using, special reverberation chambers comprised of two rooms with different reverberation characteristics. These rooms were connected by a door, the opening of which was remotely controlled by the sound engineer. These chambers provided special reverberation effects for original music recording and for re-recording.

Equipment companies announced new lines of recording equipment providing improved facilities. None of this equipment was available in 1945; but during 1946 it was expected that much of the equipment originally installed about 1928 and 1929 would be replaced.

Before World War II, the industry considered the adoption of a "control track" system for improved reproduction in theatres. This intention was revived and the industry was expected to standardize on such a system during 1946. The system would provide an auxiliary sound track, controlling the loudness of the sound in the auditorium and providing for the use of auxiliary loud-speakers during the high-level sections of the picture. It was expected that this system would permit a more realistic reproduction of large musical numbers and scenes requiring high-level sound effects. In general, the control track would not be operative during dialogue sequences.

**Film.**—The duPont company introduced a new variable density recording negative stock and a new variable density recording print stock for studio use. Both stocks were reported to be blue-sensitive fine-grain emulsions.

**Mexico.**—In Mexico City two new studios were under construction and it was believed that they would provide the best technical developments of the industry. It was reported that when these studios were completed, Mexico would have facilities adequate for the production of approximately 200 feature pictures per year. It was expected that Mexican studios would produce a considerable portion of the entertainment pictures for the Spanish-speaking countries of the world.

**Reconstruction.**—In England, France, Russia and Italy motion picture production facilities were destroyed or converted to other uses during the war. The program of reconstruction of these facilities, and in many

cases their enlargement, was actively under way. It was to be expected that the industries in these countries would emerge from the reconstruction period with the finest equipment which had been developed in any part of the industry.

**Television.**—The U.S. Federal Communications commission did not allocate any space in the ether for commercial theatre television; they did, however, authorize the use of certain frequency bands for experimental theatre television. Radio Corporation of America and other companies were believed to be continuing the development of theatre television equipment, but it was too early to anticipate the future commercial use of such equipment.

Most of the motion picture producing companies in the U.S. filed applications for commercial licenses to operate television broadcasting stations in one or more of the larger cities. At least one producing company was constructing a motion picture studio, specifically for the production of television shows. Reportedly, these shows might be either live-talent, motion picture, or a feasible combination of the two.

Considerable interest was also being shown in the industry in the possible application of television equipment to the production of motion pictures. (W. V. W.)

**Educational Motion Pictures.**—The motion picture in 1945 emerged from the furnace of World War II a superb tool of education. The armed forces during 1941-45 produced six times as many educational films as had been produced during the previous 50 years. The sharp factual and inspirational blade of this two-edged instrument was used for training and morale by the entire army and navy. More people utilized instructional films during the four years ending in 1945 than ever before in the history of education. At an expense of about \$100,000,000 the army and the air forces produced about 2,700 training films and the navy about 1,200.

The U.S. Office of Education during the same period completed a series of about 450 visual-aid units for industrial training, each consisting of a sound motion picture, a filmstrip and an instructor's manual. The filmstrip, containing stills of key scenes for review and discussion, provided a basis for new emphasis on techniques of effective utilization. The USOE announced that it had carried through its 53-month production program at the rate of 100 films a year and that it had distributed more than 50,000 prints of its pictures.

The University of Chicago established itself as a world centre for the development of classroom films, including versions in foreign languages, by transferring from New York to Chicago the Encyclopædia Britannica Films producing organization, headed by V. C. Arnsperger, and by extending the activities of the university's centre for the study of Audio-Visual Materials, under the direction of Stephen M. Corey. Among the classroom films produced by the E.B.F. organization in 1945 were notable reels on *Democracy and Despotism*.

In line with Uncle Sam's new role in world affairs, William Benton, formerly chairman of the board of Encyclopædia Britannica Films and vice-president of the University of Chicago, was appointed assistant secretary of state to develop a world-wide program for the interpretation of U.S. policies through mass-education media, including notably the use of educational films.

The American Council on Education recommended in 1945, on the basis of its researches, and as a minimum goal in the development of educational films, one 16-mm. sound projector for every 200 students—a tenfold increase in the number of projectors—150,000 machines as against 15,000 in U.S. schools in 1945.

Hollywood's interest in classroom films took practical shape in 1945 with the establishment at New Haven of a tentative research centre for the production of text films, operating with funds from the major film companies, under the guidance of a commission on motion pictures set up by the American Council on Education, Gardner L. Hart, director of the project, announced in Dec. 1945, that preliminary scripts had been prepared in the fields of art, health, democracy, mathematics and teacher training.

The MGM studio took the lead in setting up in 1945 a 16-mm. department in its laboratory, under the general direction of Arthur M. Loew, head of Loew's International corporation. Loew announced plans for world-wide distribution of MGM films in 16-mm. He indicated also that American-made classroom films would be included in his foreign distribution plans, as a step toward closing the gap between the world and the classroom. Loew said: "The war gave such impetus to the improvement of 16-mm. projectors, sound and film that today 16-mm. film approaches 35-mm. quality for audiences of less than 1,000."

Implementing the new interest of major companies in 16-mm., the Loew organization brought to America in 1945, the first group of candidates selected from its 30 foreign territories for training in 16-mm. operations. Following the lead of MGM, other major companies, including RKO Radio, United Artists and Warner Bros., announced plans for 16-mm. operations abroad.

These operations included the use of mobile units, or fully-equipped sound trucks. Similar units were introduced in the U.S. in 1945 by the University of Idaho to carry audio-visual programs to rural areas.

Thus far the major film companies were permitting domestic distribution of 16-mm. versions of their product only on a nonprofit basis, through Teaching Film Custodians, and only after the films had exhausted the domestic theatrical market. In 1945 MGM released, in accordance with this policy, through T.F.C., for schools and colleges, re-edited, 40-minute versions of *Romeo and Juliet*, *A Tale of Two Cities*, *Treasure Island* and *David Copperfield* in 16-mm.

The March of Time continued the development of its 16-mm. series for schools by increasing its Forum edition subjects in 1945 to 16, each running 20 minutes.

The National Education association recognized the growing importance of educational pictures by setting up a new Division of Audio-Visual Instructional service at its Washington headquarters, with Vernon G. Dameron in charge.

The Virginia legislature in 1945 appropriated an unprecedented \$1,112,000 for visual aids in the schools during the academic year 1945-46. One of the first orders under this budget was for some 2,500 reels of Encyclopædia Britannica classroom films.

Churches in 1945 showed a marked increase in educational film activity. A Protestant group inaugurated a film production program with an initial budget of \$1,000,000.

Periodicals devoted to audio-visual education increased in 1945 from four to six, with the addition of *See and Hear* and *Film World* to the pioneer group including *Educational Screen, Film and Radio Guide*, *Business Screen* and *Film News*. The last-named, under a Rockefeller grant, developed in 1945 from a bulletin into a regular magazine. Two additional film magazines of educational interest were launched in Hollywood in 1945—the *Hollywood Quarterly*, published by the University of California press, and *The Screen Writer*, published by the Screen Writers' guild. ## Motor-Boat Racing.

The end of World War II and the subsequent lifting of the restrictions on gasoline in the U.S. did not come in time to permit the resumption of motor-boat racing on a national scale during 1945. The only two events that brought a large number of boats together were the 13th Annual Hearst Gold Trophy regatta, held at Long Beach, Calif., and the 5th Annual Salton Sea regatta, run off Sandy Beach (Calif.), Nov. 17-18-19. Both events drew a large field of racing drivers from the Pacific coast and near-by states, and some from the more eastern states. The outstanding class in both regattas, in point of interest, was the 135-cu.in., in which a new speed record for the mile trials was established. The Salton Sea regatta established five new records, as follows:

Class	Driver	Boat	New Record	Prev. Record	How Made
135 cu.in. Pacific O.D.	Thomas Hill	"LyBee"	80.178	73.781	Mile Trial
Class A1	Hydro Elmer Cravener	"Pudgy"	52.36	51.547	" "
Outboard Class A1	Thomas DeWitt	—	46.899	45.317	Comp't. 5 Mi.
Outboard Class C11	Thomas DeWitt	—	50.281	49.528	Mile Trial
Outboard	Thom Cooper	—	63.549	60.45	" "

The speedboat championship of the Pacific coast was won in three heats by Edward Meyer in "Avenger." The same driver and boat won in both the 135-cu.in. class and the 225-cu.in. class at the Hearst Gold Trophy regatta earlier in the season.

**Motor Buses:** see AUTOMOBILE INDUSTRY IN RECONVERSION; MOTOR TRANSPORTATION.

**Motor Cars:** see AUTOMOBILE INDUSTRY IN RECONVERSION.

## Motor Transportation.

Prospects of the bus industry in the United States at the end of 1945 were substantially better than for industry as a whole. This may sound a bit contradictory since some economic factors were at work over which the industry had no control. In substance, however, the statement is true. Labour was restive just as it was in other industries, but nearly all other factors were on the credit side. Riding on both the city and the intercity lines was not far below the inflated wartime peaks, but it was continuing at a high level. This is ascribed to the continuing high level of employment and to retardation of the programs for the production of new automobiles for replacements. The end of World War II did not take all the pressure off bus operations, but it eased the situation on lines that were burdened almost beyond the capacity of the available vehicles. For the most part, these restrictions were removed. All government wartime operating embargoes were removed shortly after V-J day, the tire situation was greatly relieved, and parts were in greater supply. As indicated before, labour problems were many and some of them critical, but there was no longer a manpower shortage.

Fortunately the industry secured a substantial number of new vehicles during 1945. Year-end figures of production showed that nearly 10,000 new motor buses and more than 200 trolley buses were delivered to common carriers and that more than

THE U.S. ARMY took over truck deliveries when Chicago teamsters went on strike May 16, 1945, in a dispute over wages and hours. Acting under presidential orders, soldiers functioned as drivers and escorts

8,000 buses went to schools and to contractors that furnish school bus service. To provide vitally essential wartime transportation in 1942-45 \$1,131,000,000 was expended for new equipment, fuel and oil, tires, maintenance materials, replacement parts, garages, shops and shop equipment and tools. Despite this, the industry had to a large extent been living out of its capital, particularly in the matter of vehicles, and it was not surprising that vast expenditures were in prospect for replacement and renewals. Some idea of the extent of the expenditures in prospect in the intercity field was conveyed in the estimate of the National Association of Motor Bus Operators that \$42,000,000 would be spent for the construction and remodeling of terminals and garages as soon as wartime restrictions were lifted. In addition to construction work approximately 6,000 buses were to be purchased at a cost of \$90,000,000. With another \$10,000,000 earmarked to rehabilitate equipment the immediate postwar expenditures of the intercity bus industry were expected to exceed \$140,000,000. One system alone, Greyhound, planned to spend \$35,000,000 in the initial stages of a vast program to provide better equipment and terminal facilities for its subsidiaries. In the city field the story was very much the same. Thus New York city proposed to spend more than \$38,000,000 to modernize its bus and streetcar lines and the Third Avenue Transit system had under way a modernization program that called for the complete substitution of buses for streetcars at an estimated expenditure of about \$12,000,000. For this work 700 new buses were ordered. In Chicago, Ill., orders were placed for vehicles to cost more than \$6,000,000 while in Boston, Mass., \$10,000,000 was to be spent, in Detroit, Mich., \$25,000,000, in Cleveland, O., \$26,000,000, in Atlanta, Ga., \$5,000,000 and in Los Angeles, Calif., \$5,000,000.

This list could be extended indefinitely. It is of interest in that it indicates the extent of the improvements that were in store for the riding public. These included better lighting, air conditioning and other features in both the city and intercity vehicle. As a prospect not too far in the future it was predicted that the gasoline and diesel engines might soon be obsolete and their places taken by a gas turbine connected to a small, high-speed, glass insulated D.C. generator. These developments were said to wait only on the ability of the metallurgists to produce suitable turbine wheel material and appurtenances that would stand up under very high intake temperatures. Even the use of atomic power was predicted, once the secret was learned of how to control its release. Some of the things that were promised sound fantastic, but the growth of the use of the bus in so short

a period is in itself fantastic.

As matters stood bus and other companies that operate under fixed rates continued to face tax burdens likely to be proportionately high and would probably have to continue to do business at higher wages and higher other costs. Some slight measure of tax relief was in prospect, however, during 1946 under the modification of the excess profits tax. As the year 1945 ended the possibility loomed that the bus and other carriers might benefit by cuts in excise taxes being considered by congressional and treasury experts as subjects for hearings on the long-term bill early in the new year. Among the items that appeared likely to undergo revision or elimination were gasoline and other oil products, tires and tubes and parts and new buses.

Just as the bus performed a stupendous task on the home front the flexible and speedy truck kept raw materials, parts and subassemblies moving to the war plants and finished products flowing out to their domestic destinations and to shipsides for destinations abroad. The largest group of truck users were the farmers with their 34% of all trucks in which they hauled record volumes of agricultural products to market. It is estimated that the truck manufacturing industry produced military vehicles and parts at the rate of \$2,500,000,000 a year during the wartime period, or two and one-half times the total value of trucks and parts in 1941, the highest peacetime year. Just before the end of the war it was estimated that 4,744,000 trucks and 216,000 trailers were operating under certificates of war necessity, only slightly below the all-time peak. As in the bus field great need existed for the replacement of vehicles, surveys showing that one out of every eight trucks was made prior to 1931. (See also AUTOMOBILE INDUSTRY IN RECONVERSION; HORSES; MUNITIONS OF WAR.) (C. W. S.)

**Other Countries.**—In Great Britain the basic gasoline ration, withdrawn in 1942, was restored in June 1945. The reconversion of the motor industry, which had been given over entirely to war production, was greatly slowed by labour troubles and shortages of specialized manpower and materials. Government restrictions and taxation standards proved a further handicap, and the purchase tax on motor cars added 33½% to prices at home. The taxation led to a reduction in sales at home, and by October only 1,700 out of 7,000 government permits for the purchase of new cars had been used. Car prices showed a rise of more than 100% as compared with those of 1939, because of increased labour costs, prices of materials and the purchase tax. More than half the postwar cars and the bulk of the commercial vehicles were earmarked for export, but shipments overseas were restricted by transport difficulties.

Late in 1945 removal of the wartime ban on publication of statistics permitted the disclosure that in the early weeks of gasoline rationing in 1939, 1,627,083 private cars had been in use, a decline of nearly 200,000 on the prerationing figure. A further drop to 794,995 followed the cutting off of the basic ration in 1942, and in 1943 the number declined to 723,971. In June 1945, the day before the basic ration was restored, 1,010,744 cars were in use. New car registrations, which in 1942 were at 267 the lowest after 1917-18, showed in 1945 a progressive monthly increase, ranging from 58 in January to 510 in August.

In the supplementary budget presented in the house of commons on Oct. 23 the chancellor of the exchequer announced a tax of £1 per 100 cc. of engine cylinder capacity to operate from a date to be fixed for cars, and from Jan. 1, 1946, for goods vehicles and motor buses.

In Australia plans were made for prominent British and U.S. companies to establish manufacturing plants there. In New Zealand arrangements were being discussed for the assembly of vehicles in that country. Within two months of the end of the war South Africa placed an order in Great Britain for £2,000,-

000 worth of vehicle products.

In Europe, French and Italian production showed signs of revival, and cars and trucks were being produced in small quantities. Germany was permitted to reopen plants for the manufacture of 20,000 cars for essential services in 12 months. The soviet union announced plans for large-scale peace production. (See also ACCIDENTS; RAILROADS.)

**Mottas, Carlo Carmelo de Vasconcellos:** see VASCONCELLOS MOTTAS, CARLO CARMELO DE.

**Mountbatten, Lord Louis** (1900— ), British naval officer, was born June 25 in Windsor, England, as Louis Francis Albert Victor Nicholas of Battenberg. His mother, Princess Victoria, was a daughter of Louis IV, grand duke of Hesse, and a granddaughter of Queen Victoria. His father, Austrian-born Prince Louis of Battenberg, grandson of Louis II of Hesse, resigned as an admiral of the British navy in 1917 because of anti-German sentiment and changed his name to Mountbatten. Lord Louis entered the British navy as a midshipman at the age of 13 and served throughout World War I. He rose through the grades until, in March 1942, he was made acting vice admiral. Early in World War II his gallantry and daring attracted attention when he brought the destroyer "Kelly" to port twice after it was damaged, first by a mine and the second time, apparently hopelessly, by a torpedo. In April 1942 it was announced that he had become head of the Commandos; his title was chief of combined operations. At the first Roosevelt-Churchill parley at Quebec, Aug. 1943, Mountbatten was made commander in chief of the newly created Southeast Asia command, and the following month he was made acting admiral. Mountbatten directed the successful Allied operations against the Japanese in Burma (1944-45). He flew to Berlin for conferences with the Big Three during the Berlin conference, it was disclosed July 25, 1945. After the victory over Japan, Mountbatten accepted the surrender at Singapore, Sept. 12, of all Japan's southern armies. On Sept. 28, it was disclosed that Lord Mountbatten had dispatched British troops to Java and French Indo-China where natives were revolting against the colonial authorities.

**Mount Holyoke College.** An institution for the higher education of women in liberal arts, founded in 1837 by Mary Lyon and situated at South Hadley, Mass. The campus covers nearly 500 acres with more than 70 buildings. Registration figures for the 1944-45 session included 1,107 undergraduates and 45 graduate students, representing 41 states, 3 territories and 5 foreign countries. (For statistics of student enrolment, faculty, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (R. G. HA.)

**Mozambique:** see PORTUGUESE COLONIAL EMPIRE.

**Mules:** see HORSES.

**Municipal Government.** The most immediate problem of municipal government in the United States in 1945 appeared toward the close of the year in the form of an acute housing crisis, expected to reach its peak in 1946. The prospective inadequacy of local revenues to meet the accumulated and expanding postwar demands on local government services was possibly the most frequently mentioned problem of the year. Increased emphasis on the significance of

intergovernmental relations was likewise notable.

**The Housing Crisis.**—The closing months of 1945 found the U.S. faced by a housing deficit of about 2,000,000 family accommodations for 1946, additional to the current deficit of 1,200,000 family units. The prewar housing shortage, limitations on wartime construction, increase in civilian families, and precipitous release of veterans from the armed services after V-J day, plus the unready condition of the central or local governments in the housing field, were the root causes of the crisis. Temporary emergency expedients were called for, pending the completion of a permanent housing program by congress. National Housing Administrator Blandford urged the appointment in congested cities of a mayor's emergency committee on housing, representative of local government, industry, labour, and the public, inclusive of all groups concerned with housing, to establish or expand veteran housing services, speed housing production, and combat inflation. The problem was diagnosed as primarily local. On Dec. 12, President Truman appointed Wilson Wyatt, former mayor of Louisville and president of the American Municipal association in 1945, as housing expediter under the Office of War Mobilization and Reconversion, to co-ordinate and expedite the housing program involving "many industries, many agencies of the government and countless communities."

Meanwhile, the Wagner-Ellender-Taft senate bill, embodying an extensive public housing and urban redevelopment program, as well as important provisions to encourage private investment in middle- and low-cost housing, remained under consideration by congress.

**Intergovernmental Relations.**—Significantly, of the 19 listed recommendations adopted at the American Municipal association's annual conference in November, 15 pertained to federal-local relations, one to the international sphere, two to state-local relations, and but one to the purely municipal field. Federal action in the fields of housing, urban redevelopment, public works, public works planning, airports, and training for the public service was urgently recommended. The United States Conference of Mayors in December similarly stressed the importance of federal-local relations, commenting that "this new relationship between cities and the federal government has proved a mutually harmonious, salutary and happy circumstance."

A Pacific Coast Board of Intergovernmental Co-operation—composed of representatives of the cities of Washington, Oregon and California and of the county, state and federal governments—was formed at Portland, Ore., in June 1945, to improve the working relationship between different levels of government concerned with the same groups of people. The board—a purely advisory group meeting quarterly—was an outgrowth of the Ninth Regional Civilian Defense board set up during the war to meet Pacific coast mutual defense problems.

The Blue Earth County (Minnesota) Council on Intergovernmental Relations, established under the sponsorship of the Council on Intergovernmental Relations at Washington and composed of representatives of selected local governmental units, issued a progress report on its two-year study of the impact of increased federal and state activity on the vitality of local government. Similar projects, designed to preserve the balance between the federal, state and local levels, were also under way in Henry county, Indiana, and Colquitt county, Georgia.

The committee on state-local relations of the Council of State Governments was also at work on problems raised by the fiscal, functional, legal and other relationships between the localities and the states.

**Personnel.**—The number of city employees, excluding teachers, tended to stabilize in 1945 after a consistently downward trend—except for seasonal fluctuations—throughout the war years. The increase in municipal pay rolls, on the other hand, continued unabated, with the end by no means in sight. On an index basis of the two-year average 1940-41=100, the

number of nonschool city employees as of the month of April in 1942, 1943, 1944 and 1945 was 101, 99, 95 and 95, respectively. The corresponding pay roll dollar figures were 102, 105, 112 and 118, respectively. (Figures for 1945 are preliminary.)

**Finances.**—The end of the war found the cities for the most part in favourable fiscal position but facing the ominous prospect of greatly increased outlays, without correspondingly increased revenues, for the resumption of capital expenditures, the purchase of supplies and equipment unprocured during the war, the assumption of new and expansion of old municipal services, possible relief costs in unpredictable amounts, and the restoration of depleted personnel to full strength at steadily rising salary rates. This picture gave rise to an undercurrent of anxiety throughout the year, reflected in several state fiscal studies looking to the readjustment of state-local finances, notably in Michigan, Massachusetts, Pennsylvania, Maryland and New York. Similar studies were under way in a number of other states.

As for local revenues other than the property tax, state-shared taxes were the most important source; ten states in 1945 increased the municipal share of state-collected taxes, while four states—New York, Washington, Pennsylvania and Florida—extended new or additional direct aid to localities. Probably the outstanding legislative development was the action of the state of Maryland which granted the city of Baltimore the same general taxing powers as the state itself for the years 1946 and 1947.

Tax delinquencies continued the decline maintained continuously from 1933. As of the close of 1944 the median tax delinquency for 150 United States cities of more than 50,000 population had reached a low of 3.9%. Tax collection records, on the whole, stood higher even than in the pre-depression decade. At the same time municipal property tax rates increased for the second successive year after Pearl Harbor, by an average of \$0.22 per \$1,000 of assessed valuation; mounting municipal pay rolls were again the responsible factor. A small average increase of 1.3% over 1944 in assessed values was in line with similar slight increases in the three preceding years.

According to the *Bond Buyer*, state and municipal bond issues for the first ten months of the year 1945 aggregated \$688,000,000—an amount exceeding by more than 20% that of 1944 and by more than 50% that of 1943, when the lowest point in municipal borrowing after World War I was reached. Of the \$264,000,000 of proposed issues voted on in the Nov. 1945 elections, approximately 90% were approved. The largest single municipal item adopted was San Francisco's \$20,000,000 airport bond issue. Higher prices and lower interest rates for municipal bonds prevailed in the closing months of the year. Rates rose to 1.72% on Oct. 1, 1945, and dropped to 1.56% and 1.51% in November and December, respectively. (Figures based on the *Bond Buyer's* index of average yields of bonds of 20 large cities.) Local debt outstanding continued its downward trend from the high of \$16,812,000,000 in 1941 to \$14,164,000,000 in 1945. On an index basis of 1940=100, the annual volume for each of the five years 1941 through 1945 was: 100.6, 98.6, 94.4, 87.9, and 84.7, respectively.

**Public Works Planning and Construction.**—The cities were greatly hampered in their public works planning programs by lack of an official federal aid policy and program. Actually, the federal government appropriated \$17,500,000—as compared with \$500,000,000 requested—to be advanced to local governments through the Federal Works agency for the preparation of detailed public works plans and specifications. The inadequacy of this sum was widely recognized, but cities were urged to file applications for their full planning needs so as to impress upon congress the extent of additional aid that would be necessary. Toward the close of the year, a further \$12,500,000 were voted by the house. By December, FWA had received 3,402 requests for advances totalling \$36,312,862. Requests were arriving at the rate of \$7,000,000 monthly. All but 14 states had exhausted their allocations. The president had recognized the need and recommended increasing the total amount of the revolving fund to \$50,000,000. On the whole, the prospects of additional federal aid for state and local public works planning appeared good.

The Colmer (house) committee in its 7th report to congress in July, while opposing the use of federal aid funds for normal local public works, went on record as favouring advances to state and local governments which might undertake to speed up their normal construction programs for the purpose of providing unemployment relief, though themselves unable to finance the speeded program; it also recommended temporary aid to communities disorganized by the federal war effort, and federal advances to state and local governments for the planning of the backlog of public works. While no general program of federal aid for public works construction was adopted in 1945, funds were about to be released to cities for the start of the three-year federal aid highway program authorized in 1944, and both the senate and house bills granting federal aid for airports were passed and sent to conference.

In the state-local field, it was estimated by the Council of State Governments that from one-third to one-half of the states—as contrasted with four in 1944—were providing subsidies to the localities for local public works planning. Subsidies for construction, however, were the exception. Here again the inadequacy of the planning programs, both on the state and local levels, was attributed to the uncertainty of the federal policy and program.

**Council-Manager Cities; Proportional Representation; Miscellaneous.**—The International City Managers' association reported that the total of manager governed cities in continental United States increased to 607 in 1945. There were 24 new adoptions. Toledo voted for the third time to retain proportional representation; eight other United States cities held proportional representation elections.

Other highlights of the year included: the widespread establishment of veteran information centres by the municipalities, financed either wholly or in part by municipal funds; considerable development in municipal airport planning, in anticipation of greatly expanded postwar airline needs; a traffic and parking crisis in many cities, with the return of the automobile to everyday use; and the exit from office of colourful Mayor La Guardia of New York city, after a 12-year reform administration unique in the city's history. (See also HOUSING.) (A. M. Ds.; L. Gu.)

## 500 MUNITIONS ASSIGNMENT BOARD—MUNITIONS OF WAR

**Munitions Assignment Board (U.S. and Great Britain):** see BRITISH-U.S. WAR BOARDS.

**Munitions of War.** Army.—In the last year of the war, it was evident to the world that the United States had taken the lead in munitions production. U.S. ordnance experts led in design and planning of new weapons of war; U.S. factories had stepped up their production to the demands of the battlefields; and its supply system was putting the desired munitions where they were needed and at the time they were needed.

With peace achieved, the ordnance department of the United States army was committed to continuing research and development projects to design and produce more modern and more efficient means of waging war should necessity again arise. One such line of work was being carried on at White Sands Proving Grounds, Alamogordo, N.Mex., where ordnance technicians were in 1945 studying the German V-2 rocket. This investigation was not for the purpose of improving the German weapon but to evaluate its design in relation to U.S. manufactures. For this purpose, rockets and parts of rockets to the amount of 100 were gathered near Nordhausen, Germany, and shipped back to the United States.

Through the ordnance department, compiled production statistics were released to cover some of the major munitions items. They are:

### Ammunition Production Jan. 1, 1940 to Aug. 1, 1945

Artillery . . . . .	10,958,454 tons
Mortar . . . . .	476,312 "
Grenades, pyrotechnics, mines, explosive charges . . . . .	462,029 "
Bombs and rockets . . . . .	5,989,603 "
Calibre .30, .45, .50. . . . .	38,866,000,000 rounds

### Small Arms Production July 1, 1940 to July 1, 1945

Rifles, carbines, pistols, revolvers, Browning automatic rifles . . . . .	15,668,869	Bayonets, bayonet knives, french knives . . . . .	9,200,107
Bazookas . . . . .	476,628	Grenade launchers . . . . .	1,588,140
Submachine guns, calibre .30 and .50 machine guns and mounts . . . . .	5,293,981	Helmets . . . . .	22,619,189
		Pieces of body armour . . . . .	965,702
		Metallic belt links, cal. .30 and .50 . . . . .	12,740,000,000

### Artillery Production Jan. 1, 1940 to Aug. 1, 1945

Aircraft artillery, 20-mm. through 105-mm. . . . .	182,017	Infantry weapons: mortars, guns, howitzers, recoilless rifles . . . . .	112,902
Anti-aircraft artillery, 37-mm. through 120-mm. . . . .	44,651	Field and seacoast artillery, 75-mm. through 16-inch . . . . .	17,537
Tank, antitank, and self-propelled artillery, 37-mm. through 240-mm. . . . .	183,110	Rocket launchers, all types except bazookas . . . . .	215,163

### Tank and Automotive Production July 1, 1940 to August 1, 1945

Tanks, self-propelled weapons, miscellaneous combat vehicles . . . . .	271,165	Light and medium tanks; light-heavy trucks; heavy trucks . . . . .	2,358,655
		Other vehicles . . . . .	1,130,406
		Remanufacture and modification . . . . .	27,914
The above represented, collectively, the following dollar volumes:			
Ammunition production (except small-arms) . . . . .			\$ 9,766,166,000
Small-arms production (including ammunition) . . . . .			3,600,000,000
Artillery production . . . . .			5,167,000,000
Tank and automotive production . . . . .			19,599,000,000
Total . . . . .			\$38,132,166,000

Some of the year's munitions items follow; the list is by no means complete.

**Altimeter.**—Formerly, altimeters indicated only the altitude above sea level. The new altimeter is absolute, furnishing information as to the distance to the nearest solid object, no matter what, in a range from 0 to 4,000 ft. For close-up work, 10 to 400 ft., it is accurate to within 5 ft. of actual distance.

**Armour.**—Exceedingly tough glass fibres, woven into fabric and impregnated with a hard plastic, form a new type of armour. Weight for weight, plates of glass armour give better protection than steel and, when struck by exploding fragments of projectiles, unlike steel, the glass plates do not throw off injurious splinters.

**Artillery Weapons; Self-Propelled.**—To augment mobility and increase firepower of the ground forces, three new field artillery pieces were put into the field during the closing months of the war. These were the 155-mm. howitzer motor carriage M-41, a fast-travelling weapon with low silhouette; the 8-in. howitzer motor carriage T-89; and the 155-mm. gun motor carriage M-40.

**Bazooka.**—The army designed a new super-bazooka, an M-12 rocket launcher. It fires a 38-lb., 4.5 in. rocket having destructive force of a

105-mm. high-explosive shell. Weighing 22 lb., this launcher and its rocket can be carried easily by one man and set up quickly on a tripod mount. A featherweight bazooka, 10½ lb., is equipped with a new "eye" sight. It is 42% lighter than the standard bazooka model and can be handled as easily as an army rifle. Its optical sight equipment is on a folding mount so constructed as to afford unrestricted vision while aiming at fast-moving targets such as tanks. An elevation adjustment eliminates the army's conventional rifle sights. It is so improved that it created the qualification, "bazooka sharpshooter." Impulse generators replace former dry-cell batteries used in firing the rocket launcher and a 2-position stock permits firing from standing, kneeling, or prone positions.

**Bomb Bowling Alley.**—The chemical warfare service designed this means of delivering 500-lb. incendiary bombs direct from freight cars to open air storage racks. This safety device made possible unloading of these bombs as easily as a pinboy returns balls in a bowling alley since its chute is so designed that a descending bomb can be made to roll any distance, 2 ft. or 200 ft., before stopping.

**Bombs.**—The British royal air force brought out a new 12,000-lb. "earthquake" bomb. Three times the size of the original blockbusters, it has an estimated blast damage sufficient to cover an area of approximately 80,000 sq.yd.

The British are also responsible for the new "Volcano" bomb weighing 22,000 lb. The first one dropped off the coast of England obliterated a small granite island. On land, a ballast-loaded dud buried itself so deep that it took 1,944 man-hours of work to dig it out. A live "Volcano" dropped on land displaced thousands of tons of earth and set off underground explosions which continued long after the bomb blast.

The incendiary bomb, M-69, was the devastating weapon used against Japan. It is 19 in. long, 6½ lb. in weight, and is loaded with a cheese-cloth sack full of a new type jellied gasoline. To retard the bomb's fall, so that mechanism be not damaged upon impact, it is equipped with trailing tail streamers which help hold the drop to about 250 ft. per second. When the bomb hits, its delayed-action fuse permits it to fall over on its side before the incendiary charge is fired. A sticky, flaming pancake of jellied gasoline, ¼-in. thick and 3 ft. across, is driven a distance of more than 100 ft. to set on fire any object to which it clings.

The JB-2 robot bomb is a copy of the German V-1 robot. It travels from 400 to 440 mi. an hour at 6,000 ft. altitude. Its range is estimated at 150 mi. The engine of this bomb is started by a spark plug in top of the combustion chamber, power coming from a battery on the ground. When fired, the robot, with its launching car, roars upwards. When a speed of 260 m.p.h. is reached, the launcher drops off and the bomb travels on its course by jet propulsion.

A lava bomb, M-74, is fashioned from a 10-lb. tube loaded with synthetic lava, one of the ingredients of which is "goop," magnesium powder coated with asphalt powder. The bomb is about 19 in. long. At one end there is a collapsible metal tail which opens when the bomb is released from its cluster. A plastic cup inside the bomb holds ½ lb. of white phosphorus, several pounds of synthetic lava, and a dome-shaped ejection mechanism. Blown open by a burster charge, the ejector works like a piston to cause the bomb to regurgitate its contents in a minor volcanic eruption, the material of which sets fire to everything it touches.

A coloured streamer smoke bomb, M-87, was designed for use with precision instruments to make possible bombing of enemy targets through clouds, smoke screens, or other atmospheric disturbances. Its coloured smoke persists in the air for at least a minute and is visible to following planes at a distance of five miles. (See also ATOMIC BOMB.)

**Boosters.**—Highly efficient ammunition boosters were developed to feed guns properly. By using these improved ejection systems, together with flexible feed chutes, the .50 calibre machine gun was given a substantial increase in its cyclic rate of fire.

**Bridge.**—A new type of floating bridge is constructed by using hollow aluminum beams so light they can be placed by hand and yet so strong they will support a weight of 50 tons.

**Bridge Builder.**—A launching device known to U.S. troops in Germany as the "Monster" places steel beams so rapidly that it was possible in bridging the Moselle river to launch six 100-ft. metre beams in 90 minutes. Ordinarily such a job would require 3 hours. In one test a completely prefabricated bridge span, 50 ft. in length, was lifted smoothly into place with one swing.

**Bullet.**—A new frangible bullet was perfected for training purposes. It is a calibre .30 machine-gun slug made from a combination of plastic and lead. The bullet is hard enough to withstand firing from a machine gun but soft enough to splatter into a fine, harmless powder upon impact with the armour plate of planes against which it strikes in firing manoeuvres. It is possible for gunnery students on air firing missions in training to fire live ammunition at another plane and check the accuracy of their aim by reading the splashes left by the crumbling frangible bullet on the armour plate of the plane attacked.

**Cameras.**—The signal corps produced several notably new and efficient cameras for combat and scientific work. One, a motion picture camera, weighed 16 lb. fully loaded, and is equipped with a gunstock base to handle like a rifle. It has four lenses of different focal lengths, all instantly interchangeable. Another, a still camera, has two lenses and uses a film pack. Construction is all metal and there are no bellows or leather fittings to be rotted by tropical humidity and fungus growths. At the request of the medical corps, the signal corps was responsible for the development of a new camera using an ultra high-speed, high-intensity, self-contained light source. The camera operates easily, taking pictures in black and white or colour, indoors or out, at distances from 6 in. to 12 ft. Except for focusing and clicking the shutter, its action is entirely automatic. Light source for the new camera is a coiled, circular quartz vapour discharge tube, designed by the General Electric company, and giving a flash of approximately 1/25,000 second duration. This camera, valuable to surgeons for recording steps in the course of difficult operations, is fast enough to "freeze" the whirring of a moving fan blade.

Above: RADIO-CONTROLLED PQ plane, being directed by the pilot in its mother plane. He took over after the plane reached the air by remote ground control. Developed by the Control Equipment branch of the ATSC, details of the plane were released by the U.S. navy on Oct. 12, 1945

Below: THE M18, new 57 mm. recoilless rifle provided for U.S. infantrymen in 1945. It has the striking power of field artillery and can be handled by one man

Right: T-9 ARMY TANK being slung under the fuselage of a C-54 "Skymaster," U.S. transport plane which speeded tank deliveries to war fronts during 1945

Lower right: ROCKET BARRAGE being fired from a navy landing craft during an invasion operation in 1945. The navy's vast \$2,000,000,000 rocket program indicates the fire-power value of these self-propelled weapons

**Carbine Stock.**—A new collapsible stock for M-1, calibre .30 carbine was designed at Springfield armory. It can be collapsed or extended quickly, yet remains rigidly fixed when in firing position. This stock makes the M-1 an ideal weapon for jungle fighting or airborne operations, because it lightens an already light weapon—a decided asset in combat.

**Carrier.**—A new hand grenade carrier was made large enough to carry six pineapple type grenades, three large, or three smoke grenades. It was made of olive-drab hard texture duck and fastened to the soldier's cartridge belt with a brass hook.

**Charger.**—General Electric developed an automatic charger consisting of three principal units—charging, firing and timing. It operates through high air pressure furnished by a turret-mounted compressor. This charger seems to think for itself. Initially it cocks the gun, recognizes an ammunition failure, helps dispose of a defective round of ammunition and insert and fire a new one. If the gun fails for eight successive rounds, the charger automatically stops all further firing from that piece.

**Cream (Protective).**—The quartermaster corps adopted a flash-burn protective cream for use by tank crews and soldiers using bazookas and flame throwers. It has no medical properties and will not cure burns. Its job is to provide fire-proof protection for exposed parts of the body against burns from sudden flashes of flame.

**Detector Kit.**—A chemical agent detector kit, M-9, a miniature gas-analysis set, is packed into a 2½ lb. cotton duck carrier which is slung by a strap over the soldier's shoulder. It is extremely sensitive and will register the presence of persistent and nonpersistent chemicals. The assembly includes an air-sampling pump, chemical reagents, and detector tubes which contain varying chemical combinations, each reacting characteristically in definite colour patterns in the presence of varying gases.

**Detonator.**—A new radio-controlled detonator was demonstrated that will fire mines by remote control as far as 20 mi. away, on land or sea, by dialing a combination as in making a telephone call.

**Fuse.**—A new proximity fuse was widely acclaimed as one of the definite factors which hastened the end of the war. It consists of a small, rugged radio transmitter and receiver, about the size of a man's fist. Placed in a bomb or projectile, it sends out high-frequency radio waves which cause the detonation of an explosive charge when they bounce back from enemy aircraft, vehicles or the earth itself. Originally, power was provided for the minute radio by development of a tiny dry-cell battery, no larger than the cap of a fountain pen. This limited source of power was subsequently replaced by a generator motivated by a small windmill propeller, recessed in the nose of the projectile. This tiny wind-driven generator, evolved in perfection of the proximity fuse, was no larger than a watch and was so designed as to fit either into the nose of an aerial bomb or rocket projectile. At 100,000 revolutions per minute, this windmill supplies power enough to create continuous emanation of radio waves from the bomb or projectile. To prevent the proximity fuse from detonating the explosive charge upon receipt of wave echoes from the aircraft which launched it or from other nearby friendly planes, connection between fuse and detonator is left open until after the projectile has been launched, after which it closes automatically.

**Grenade.**—Army M.P.'s and occupation troops are furnished with a newly developed tear gas grenade. It is shaped like a baseball. To fire, the safety pin is pulled while holding a finger over a release plug; then the grenade is thrown just like a baseball. This forces the plug out, the thin plastic coating of the sphere bursts, and a fine, tear-producing powder spray is scattered broadcast with immediate lachrymatory effect.

**Gun, Antitank.**—A new 90-mm. antitank gun was developed capable of piercing 8-in. armour and of destroying a Panther-type tank at 6¼ mi. range.

**Gun, Mobile Anti-aircraft.**—This new weapon, largest of its kind using fixed ammunition (105-mm.) has a muzzle velocity of 3,000 ft. per second and can fire a shell to a height of 46,000 ft. This weapon can be controlled manually or by the anti-aircraft detector.

**Gun sight Lamp.**—Enables a gunner to aim directly into the sun and fire with deadly accuracy. This walnut-size lamp provides 30 times more light than previously used lamps. It eliminates the dreaded blind spot, and with its sight lines, or "reticle," are visible, even against a glaring sun. No dark filter, with its partial obscuring effect, is any longer necessary.

**Ingolin.**—A new fuel developed by the Germans to launch their V series of bombs. A high concentrate of hydrogen peroxide in water, it can be used either as a fuel or as a source of stored oxygen. Its inventor claimed it could provide an aeroplane with speed of 650 m.p.h. for one hour or 450 m.p.h. for three hours. Germans planned to use it in submarines to power the main engines while running submerged.

**Life Preserver.**—A new yoke-type preserver was designed to be worn with full infantry equipment and allow removal of soldier's pack without removing the yoke. Made of kapok.

**Locator.**—A new, electronically operated locator was adapted to anti-aircraft searchlights so as to keep the beam automatically trained steadily on any enemy plane.

**"Mattress Fire."**—This type of fire is used to lay down a heavy barrage in a concentrated area. It is fired by highly mobile rocket units usually firing the 4.5 rocket which weighs 38.4 lb. and has an explosive charge of 4.3 lb.

**Mortar.**—A new 10-in. mortar was perfected with a firing rate of one round every two minutes and with a range of more than five miles. Another mortar, "Little David," the most destructive weapon of its kind, is the epitome of present-day mortar construction. Its official name is 914 mm. (36¼") mobile mortar. It hurls a 3,650 lb. shell a distance of six miles, firing through a 22-ft., muzzle-loading rifled tube. This tube, with its firing mechanism, and other parts of the assembly make up a total weight of 80,000 lb. Base assembly for the huge weapon is a metal box weighing 93,000 lb. Tube and base assembly travel separately and the complete unit also includes a bull-dozer and crane with bucket-shovel to dig the necessary emplacement. Even though this weapon is larger than the German 820 mm. weapon, it can be emplaced in 12 hours, where the German gun, travelling on 24 railway cars, required three weeks to put it into firing position.

**Periscope Gun Sight.**—The periscope tube of this sight passes completely through the fuselage of a plane and has sight heads at both top and bottom. It is linked by remote control with the gun turrets so that gun turret and periscope sight move in unison. Its placement enables a plane gunner to search the skies above, below, or on either side of his plane. A flip-over mirror transfers the image from one end of the periscope to the other should the plane climb or dive rapidly and reverse positions. Electrical devices called selsyns make possible the synchronized movement of gun sight and gun turret. The optical system for this sight was designed originally by Bausch and Lomb and later modified by the Eastman Kodak company. The General Electrical company was responsible for over-all design and construction of the complete unit.

**Projectiles.**—Hardest material ever made by man, tungsten carbide, was placed in projectiles used in closing months of war. Such shells sometimes stopped tanks with a single shot at ranges up to 3,000 yd.

**Radar.**—See RADAR.

**Radio.**—Communication problems gave birth to two new radio sets used successfully in both theatres of war—the AN/VRC-1 and AN/TRC-7. The first-named, designed for operation from a jeep, is a combination of high-frequency and very-high-frequency radio with a variable distance range of 20 mi. for voice, 40 mi. for tone, and 60 mi. for continuous wave when high-frequency transmitter is used. The AN/TRC-7 is a portable set, carried by dismounted troops to maintain contact with aircraft. The set weighs 100 lb. and can be dropped by parachute to ground troops. It is a very-high-frequency transmitter and receiver and can be operated from a hand-operated generator or from dry cells.

**Rifles.**—Two new recoilless rifles were designed and tested successfully in actual combat conditions. They are 57-mm. and 75-mm. calibre and were used both in the European and the Asiatic theatres. Their use gives the infantryman the striking power of artillery. The smaller of the two rifles weighs 45 lb., is 61 in. long and fires a high-explosive shell, weighing nearly 3 lb., a distance of 2 mi. The larger weapon, the 75-mm., is 82 in. long, fires a 14-lb. high-explosive shell more than 4 mi. and both weapons shoot with the accuracy of a sniper's weapon.

**Rocket Launchers.**—Three new multiple-tube rocket launchers were especially efficacious in the last year of World War II. For rocket battalions an 8-tube, 4.5-in. rocket launcher was devised. It was used both as a ground weapon and mounted on trucks or jeeps. It was nicknamed the "Xylophone." This launcher can be disassembled into two-man loads for easy transportation. It fires a rocket 30 in. long, weighing 38 lb., and having the striking power of a 105-mm. shell. The 60-tube, 4.5-in. rocket launcher was known as the "Calliope." It was built to be mounted on a tank turret so that it could be rotated with the turret and elevated with the gun. If necessary, this rocket launcher can be jettisoned by operating a lever inside the tank without exposing members of the tank crew. The 20-tube, 7.2-in. rocket launcher, "Whizbang," throws a rocket equivalent in firepower to a 155-mm. shell. This launcher is 5 ft. long, weighs 115 lb., and has a maximum range of between 2 to 3 mi. It is armoured to protect its load from small-arms fire and, like the "Calliope," is mounted atop a tank.

These three new launchers, plus the single-tube, one-man, 4.5-in. launcher (M-12) and the triple-tube, underwing aircraft launcher (M-10), constitute the important members of the army's rocket launcher family. All these launchers are simple in design and construction and easy to maintain. Their electric firing system is no more complicated than the lighting mechanism of an ordinary flashlight. On the multiple-tube launchers, firing is done electrically by a selector switch which can be set to fire rockets individually or at any desired rate. Usual rate of barrage fire is at half-second intervals.

**Rockets.**—A spinner rocket was put into use against the Japs on Iwo Jima in Feb. 1945. Its design admitted of firing from multiple-tube launchers mounted either on ships or land vehicles. It is stabilized by rotation in flight instead of by the customary projecting fins. Spinning motion is achieved by angle discharge of gasses from the motor's end piece.

The Germans' third secret weapon was uncovered at Mimoyecques, near Calais, France, where there were batteries of long-range guns capable of hurling rocket shells 100 mi. This installation was designed to handle the new V-3 rockets and could have fired 600 shells an hour on London. Firing battery consisted of 50 smoothbore barrels, each 400 ft. long, sunk 350 ft. into the hills at an angle of 55 degrees. The whole installation, spread over several acres, was protected by concrete armour 18 ft. thick.

Yankee ingenuity devised means for using bazooka rockets for cutting wire entanglements. A standard rocket fuse will detonate only against hard surfaces such as brick walls, sides of tanks and the like. But, by lowering the tension of the fuse spring, U.S. soldiers so altered the rocket's explosive incidence that it fired upon hitting even one string of wire.

**Shell Loading.**—The ammunition division of the ordnance department developed two new machines to supplant the slow hand-loading method of packing T.N.T. into shells. One of these looks like a milking machine and is called the "mechanical cow." It cools the exact amount of T.N.T. to correct temperature, then pours it through nozzles into 24 shells mounted on a carriage. After further cooling, the second machine, known as "hot bayonets," comes into operation. Twenty-four round rods, slung under a steel bar, are steam-heated and plunged clear to the bottom of the partially loaded shells to eliminate air cavities, a frequent cause of premature explosions. When the "hot bayonets" have finished explorations, shells are carried back to the "cow" and molten T.N.T. is added to complete the loading.

**Shop (Floating).**—In the Southwest Pacific in 1945 a floating repair shop went directly to any broken equipment needing repair. Huge, concrete, ocean-going barges were transformed into floating shops that were operative within 24 hours of reaching the place where needed. These barges are 269 ft. long and 48 ft. wide. There are eight holds providing over 10,000 cu.ft. of storage space and there are more than 8,000 sq.ft. of covered deck space for shop installations. Electric cranes on the floating shop pick the waiting repair jobs off the dock and set them aboard the shop for necessary work. Protection is afforded by deck-mounted anti-aircraft guns. The barges are equipped to recondition engines, rebuild

power train and electrical assemblies, retread, vulcanize and repair tires, or any other type of repair and rebuilding.

**Snow Cruiser.**—New, full-track snow cruiser devised for the air forces to use in deep-snow country for towing and light cargo handling. Weighs  $2\frac{1}{2}$  tons loaded and has a speed of 20 m.p.h. Its ground pressure is only .84 lb. per sq.in. and its cruising range is 100 mi. Equipped with suspension type running gear with 14 wheels, endless 6-ply fabric belt, the cruiser is powered with a 90-h.p. gasoline engine and can negotiate snow 50 ft. deep.

**Tank Howitzer, 95-mm.**—The British, shortly after D-day in Normandy, used this new weapon as part of their tank armament to replace the obsolete 3-in. guns. The new howitzer fires high-velocity shells, using either explosive or smoke and, in addition to its other advantages, it adds high trajectory employment at close ranges.

**Tanks.**—Among the new weapons displayed at Fort Myer, Va., was the new 43-ton M-26 General Pershing tank with a long-barrelled 90-mm. gun, firing a shell with a muzzle velocity of 3,750 ft. per second. Striking power of this shell is sufficient to penetrate 14 in. of armour at 300 yd.

**Tester.**—The Evansville ordnance plant, Chrysler corporation, made a machine for testing waterproof qualities of metal containers for calibre .30 and .45 ammunition. This "Vacuveyor" can test 780 metal cartridge containers an hour. Imperfect containers emanate bubbles as they pass through the water channel of the machine and these are quickly spotted by an operator watching the test through strong plastic windows in the side of the machine.

**Tire.**—The Goodyear company built a giant tire capable of bearing the entire weight of a fully loaded B-29. Made of 36-ply nylon and rubber its outside diameter is 110 in., with 44-in. cross section. One-third of its 1,500-lb. weight is nylon and in hydrostatic test it withstood pressures up to 375 lb. to the square inch.

**Trailer (Amphibious).**—For combat units a new all-steel, flat-bed, cargo-type of trailer was devised. Body of the trailer is watertight and can be towed by a jeep or by an amphibious truck. The unit weighs 1,050 lb. and can take care of a payload of 500 lb.

**Weapon Case.**—A new weapon case was devised for paratroopers. It is made of olive-drab canvas and webbing, and is padded with felt should the paratrooper land with the weapon beneath him.

**Welder.**—On a specially designed and equipped jeep, a perfected arc welder was mounted. The  $\frac{3}{4}$ -ton jeep replaced a 5-ton truck and a  $1\frac{1}{2}$ -ton welding trailer formerly used. The whole assembly may be loaded on a transport plane. General Electric co-operated with army engineers in its production and it proved its worth in keeping front-line equipment in fighting condition.

**Wrapping.**—A time and labour-saving machine was developed by the ordnance department to wrap infantry rifles dipped in rust-preventive compound. In this machine, the rifle revolves while the operator feeds the greaseproof paper wrapping. By this method, more than 400 rifles can be wrapped in a day by four men; formerly, it required eight men to wrap 300 rifles in the same time.

**X-Ray.**—The Westinghouse company designed a new X-ray unit taking a picture as short as one-millionth of a second. Rapidly moving projectiles can be photographed while passing through a gun barrel in firing, to determine location of the projectile with respect to curve of gas pressure. By use of the new unit, rapid acceleration in course of firing can be studied to note effect on component parts of composite projectiles such as explosive bullets. Progression of a bullet through armour can be studied and the new method eliminates recordings of luminous fragments of impact shown formerly as splashes on the film. This new X-ray method showed for the first time that explosive shells swell to nearly twice their normal diameter before bursting. To operate the unit there are required 2,000 amperes at 300 kv., or 600,000 kw. for a microsecond.

**BIBLIOGRAPHY.**—*Army and Navy Register; Army and Navy Journal; Army Ordnance; Command and General Staff School Military Review; Time; Newsweek; War Department press releases; Life; The Illustrated London News; Chemical Warfare Bulletin; The Military Surgeon; The Field Artillery Journal; New York Times; Army Motors.* (R. S. T.)

**Navy.**—The beginning of 1945 saw the U.S. navy's shipbuilding program continuing according to schedule with maximum emphasis placed on the APA (assault transport) program being carried on by the Maritime commission in commercial shipyards. These ships, already tried in amphibious warfare, were designed with their companions, the AKAs (assault cargo ships), so that they might be unloaded in the course of a landing operation with assurance that men and material would be disembarked in the order and at the time needed. The programs were brought to a successful conclusion in time to meet the requirements of the later stages of the war in the Pacific. The continuation of the combatant ship program brought the commissioning during 1945 of 5 aircraft carriers of the "Essex" class, the first 2 of the CVBs (large aircraft carriers)—the 45,000-ton "Midway" and "Franklin D. Roosevelt"—13 escort carriers, 7 light cruisers, 8 heavy cruisers, 74 destroyers, and 37 submarines. In the case of some destroyers, alterations were made in their armament to make them more effective against prevailing enemy tactics.

Landing craft previously developed and tried in action continued to be produced and in many instances basic types were converted to meet specialized needs. Notable among this group were the LSM (R)s—the landing ships medium—rockets—in which conventional types of armament were replaced by rapid-fire rocket launchers.

The cessation of active resistance by both Germany and Japan permitted the revelation of various weapons which had been in use for many months—some for years—although closely guarded as military secrets. Of these the most spectacular was the VT or variable time fuse. Essentially a miniature self-powered radio sending and receiving set, so small as to be seated in the nose of a projectile and rugged enough to stand the shocks of gunfire, this device received the signals echoed from a target and used them to initiate the detonation of the projectile at the most advantageous point for maximum destruction. The VT fuse was used initially in the U.S. navy's 5-in. A.A. guns and later in the 3-in. A.A. guns,

CUTAWAY VIEW of the radio proximity (VT) fuse developed by the U.S. and first revealed on Sept. 20, 1945. The fuse, containing a radio transmitter and receiver, is fitted into the nose of a projectile. When the projectile is fired, the transmitter sends out a continuous wave. As it moves within effective range of a target, part of the wave is reflected back to the receiver, and an electronic device explodes the missile

increasing the effectiveness of both very markedly. The fuse was developed by section T of the Office of Scientific Research and Development and its reduction to a mass-produced item represented a real triumph over technical difficulties in both the development and the production phases. In the fleet it provided an effective defense against Japanese planes, whether they were making normal attacks or their last-stand Kamikaze or suicide attacks. It was supplied to the British, who used it with a vital effect in the ultimate defeat of the German buzz-bomb or V-1 rocket projectile, and to the U.S. army, where it was given credit for a large part in the turning of the tide in the Battle of the Bulge. Each application of the VT fuse to a particular gun and projectile combination required special engineering, but the whole project, involving a large group of parts manufacturers and fuse assemblers as well as the thousands of naval and mili-

tary personnel concerned with its supply and use, was a remarkably well-kept secret.

The high-capacity (thin walled, large bursting charge) projectile which had been used in the amphibious operations of 1944 was produced in greatly increased quantities in 1945. Used by the main batteries of battleships, both old and new, heavy cruisers and light cruisers, these projectiles were a major factor in the success of the landings in Lingayen gulf, at Iwo Jima, and at Okinawa, where close-range pounding of shore targets by capital ships beat down enemy resistance so as to make landings feasible and then to support the troops established on the beaches.

Laboratories under the direction of the Office of Scientific Research and Development developed rockets for both the army and the navy. Furnished by each service to the other, rockets became potent weapons for air attack against ship and ground targets. They were used effectively by the carrier-based planes of the Pacific fleet's carrier task forces and by planes of the army air forces in both the European and Pacific theatres. In the final stages of landing operations, when the close approach of the landing craft to the beaches made it necessary for supporting destroyers and heavier ships to cease firing, rockets launched from specially armed landing craft provided a final and effective cover immediately before the troops hit the beach.

The introduction of more violent explosives, to replace the conventional T.N.T. and ammonium picrate, provided for greater destructive effect with weapons already standard in the navy. Another development revealed was the electric torpedo used extensively and effectively by U.S. submarines in the Pacific. This torpedo, which was basically a copy of a German torpedo, was produced in quantity by a commercial source. Its most valuable feature was the absence of a tell-tale wake which marks the track and the firing point of a compressed air or steam torpedo. The extensive mining operations of the 20th air force, U.S. army, carried out in Japanese home waters from bases in the Marianas, used U.S. navy mines, many of them developed and produced after the beginning of the war.

The outstanding weapons used by the Japanese against U.S. naval task forces were the Kamikaze or suicide technique, in which conventional aircraft either with or without bomb loads were flown into collision with U.S. ships, resulting in fires and heavy casualties and in some cases serious damage; and the Baka bomb, a glider with rocket power, which could be carried under a twin-engined bomber or torpedo plane, and when released was flown into its target by a human pilot. Against these two types of attack the anti-aircraft batteries of the ships, particularly with VT fuses, provided an adequate defense from those planes which succeeded in eluding the combat air patrol of the U.S. fighter aircraft. Even so the Kamikaze attack was a menace.

Against the Japanese homeland the fast carrier task forces and their attached battleships delivered telling blows with bombardments of vital targets from surface ships and a long series of air attacks using both incendiary and demolition bombs of types common to both the army and navy and supplied to both services by the former.

The extent of the use of ammunition may be indicated by the expenditure of 23,000 tons of navy gun ammunition and aircraft bombs against the Japanese positions on the tiny island of Iwo Jima in the bombardments which preceded the landing and continued in support until the island was secured.

The most potent single attribute of the U.S. fleet was its mobility. This was assured by the development of techniques for replenishing fuel and supplies underway in the open sea, which Admiral Nimitz described as his "secret weapon."

**Air.—Aircraft Bombs.**—Outstanding development in large bombs during 1945 was the full operational use by the R.A.F. of the 12,000-lb. "Tall Boy," 22,000-lb. "Grand Slam," and by the A.A.F. of the 4,500-lb. "Disney," a rocket-assisted concrete piercing bomb. Of the three, "Tall Boy" had the most extensive combat testing, and it proved highly successful against special targets such as battleships, ground installations protected by 16 ft. or more of reinforced concrete, underground installations consisting of tunnels, factories, storage, etc., heavy bridges and viaducts, dams and canal dykes, etc. An even larger bomb was required against submarine pens, hence "Grand Slam" was developed and its effectiveness proved in a limited number of operational tests. Both were used by highly trained Lancaster crews, and extraordinary accuracy was attained. The degree of damage caused by near misses was especially notable. Because of its great size, "Grand Slam" was carried externally, with the bomb-bay doors completely removed. "Disney" was used by the 8th air force in four combat missions against E-boat pens in Holland and U-boat pens in Germany. Excellent accuracy was obtained, and in the case of direct hits, substantial damage inflicted. At the time of the surrender of Japan, plans were well under way to use "Tall Boy" and "Grand Slam" with B-29s against Japanese cave and tunnel ground defenses and what capital ships were left afloat.

The M-69 fire bomb, composed of an incendiary cluster containing a jelly-gasoline compound, was actually developed prior to 1945, but its tactical use by the 21st bomber command constituted it a prime factor in the collapse of Japanese resistance. As a result of a daring decision by Major General Curtis LeMay, the B-29s were switched from their traditional role of high-altitude precision bombing to low-level (5,000 to 8,000 ft.) night attacks carrying 100% of incendiaries. Missions averaged 300 B-29s carrying from 6 to 8 tons, mostly the new M-69s. In the ten days beginning March 9-10 with the surprise attack on Tokyo, five missions were run, and more than 29 sq.mi. of Japan's chief industrial centres were burned out beneath a rain of bombs that totalled 10,100 tons. Losses dropped to around 1% of aircraft over the target, and in the coming weeks to much lower than that. Within five months Japan's war economy was ruined, even without the atomic bomb.

Another important development was the Napalm fire bomb. This was simply the old jettisonable fuel tank filled with Napalm gel and equipped with igniters. Dropped from a fighter aircraft it became a fire bomb which caused 20,000 to 30,000 sq.ft. of devastating conflagration. Napalm gel is a rubbery, sticky substance consisting of 94% gasoline and 6% Napalm, an inert aluminum soap powder which cleaned out enemy positions by pinning down the intense heat of the burning gasoline. Shooting

into crannies and crevices, it was highly effective against supply dumps, ammunition stores, pillboxes, gun positions and troops entrenched in caves.

**Aircraft Rockets.**—Military use of the rocket was one of the major armament developments of World War II. First used as ground weapons, the Russians had the "Katusha," the U.S. army the "Bazooka," and they were also employed by the British and Germans. They were first used from aircraft by the Russians and the British with rail-like runways, and from the fall of 1943 by German fighters against U.S. daylight bombing missions. After that they were widely used by the U.S. navy and A.A.F. The rocket and aeroplane are natural partners, offering a maximum of firepower with a minimum of added weight, and no recoil. The air-borne rocket was a major factor in transforming the fighter plane from a weapon of defense to a devastating weapon of attack. The latest development in 1945 to see widespread use was the 5-in. HVAR (high velocity aircraft rocket) developed by the National Defense Research committee at the California Institute of Technology for the U.S. navy and army air forces. When available in quantity, it supplanted the 4.5 rocket fired from clusters of three rocket-launcher tubes under each wing, which were practically air-borne bazookas. The 5-in. rocket was 6 ft. long, weighed 140 lb., carried 8 lb. of HE in the head; velocity was 1,300 ft. per second plus the speed of the aircraft. Maximum accurate range was 1,000 yd., at which it would penetrate nearly 2 in. of armour and 3 ft. of reinforced concrete. They were fired from "zero length" launchers consisting of two streamlined posts or studs, holding the rockets about 6 in. below the wing. HVAR objectives included oil storage tanks, A.A. positions, boats, hangars, warehouses, revetted fuel tanks or dumps, trains and locomotives, tanks and other armoured vehicles, ammunition dumps and dispersed aircraft. A still lighter 115-mm. rocket was under tests before the end of the war, with two carried by each post, doubling the effective rocket power of each aeroplane. On the other hand, a much larger rocket, the 11.75-in. "Tiny Tim," was just coming into operational use by the U.S. navy at the time of the Japanese surrender. "Tiny Tim" weighed 1,288 lb., used a 500-lb. SAP (semi-armour piercing) bomb for a head, carried 148 lb. of ballistite and measured 123 in. in length. Two of these big rockets, plus eight 5-in. HVARs gave carrier fighters truly devastating firepower.

**Aerial Mines.**—The aircraft-laid parachute mine, practically unknown when World War II started, proved its effectiveness during the last year of the conflict. Used against enemy shipping, submarines and warships, these aerial mines were similar to bombs except that they were equipped with a parachute instead of fins. The 1,000-lb. mine was used for water up to 15 fathoms, and the 2,000-lb. for water up to 25 fathoms. They were mostly of the magnetic type, sinking to the bottom and exploding when influenced by the metal in the enemy ship passing overhead. Acoustic mines were also used. The greatest aerial mining operation in history, planned to complete the blockade of Japan started by the submarine, was known as operation "Starvation" (strategic mining of Japanese waters by B-29s). Extending from March 27 to Aug. 15, 1945, the campaign was carried out in five phases, beginning with the mining of the great ports, naval bases and the highly important Shimonoseki strait. Some 1,528 B-29s of the 313th wing (21st bomber command) laid 12,053 mines in the targets, with a loss of but 15 aircraft.

**Guided Missiles.**—Although too late to affect the final results of the war, the German drive for new techniques in air warfare brought forth some startling developments which would have caused considerable damage if the war had continued another few months. These included an improved FZG76 flying bomb (V-1) fitted with long-range fuel tanks, and A9 and A10 long-range rocket projects; A9 was the regular A4 (V-2) which was operational in the autumn of 1944, but with wings enabling it to glide, increasing its range; A10 was an A9 attached to the A10 unit which acted as a giant booster rocket, to be jettisoned after carrying the A9 far into the stratosphere. The Bachem BP 20 Natter (Viper) was launched vertically from a rocket platform by two solid-fuel rockets which were jettisoned at 3,000 ft. at which point the Walter HWK 109-509 bi-fuel rocket motor provided sufficient thrust to carry the projectile to 36,000 ft. at a rate of 600 mi. per hour. The climb was ground-controlled but the pilot in the nose took over for the actual interception. After attacking the hostile bomber formation with 24 Fohn 7.3 calibre rockets in one salvo, the pilot and rocket motor descended to earth by parachute. A formidable air-to-air weapon, in quantity production by the spring of 1945, was the X4, a wire-controlled, rocket-propelled gyro-stabilized missile launched from Focke-Wulf 190 fighters at a speed of 620 m.p.h. The nose section of the well streamlined fuselage contained the 110-lb. warhead; the centre section housed the liquid propellant fuel, while the rear section contained the gyroscope, battery and electrical services. There were many other similar projects in various stages of development.

Examples of U.S. developments in guided missiles include the U.S. navy's "Glomb" (glide bomb), "Gorgon" and "Gargoyle," and the army air force "Azon," "Razon," television bombs, jet-bombs, heat-seekers, light-seekers, etc. "Glomb" was a pilotless glider which carried a 4,000-lb. bomb (LBE-1); "Gorgon," a jet-propelled missile carried by a bomber and guided to the target by radio or by its own target-seeking device at 550 m.p.h. (100-lb. bomb); "Gargoyle" (LBD-1) was a jet-propelled missile which carried a 1,000-lb. bomb at 600 m.p.h. and automatically sought its target. "Azon" (VB-1—vertical bomb) was a 1,000-lb. bomb with gyro and radio control unit for azimuth only (hence az-on); it was used with great success in knocking out hard-to-hit key bridges in Burma. "Razon" goes one step further, being controllable in range as well as azimuth; tests were completed in the spring of 1945, and a few of the production bombs were used in combat action before the end of the war. JB-2 (jet bomb) was an A.A.F. "Chinese copy" of Germany's V-1 buzz bomb, but with improved control. Television bombs included the GB-4 and ROC, launched and controlled from aircraft. Japan's main contribution in the field of special weapons was the piloted glide bomb Baka, used as a desperate "kamikaze" (Divine Wind) suicide defense measure in the spring of 1945. Details of British developments in the guided missile field were not released during 1945.

(See also ATOMIC BOMB; AVIATION, MILITARY; NAVIES OF THE WORLD; RADAR; SUBMARINE WARFARE; WARFARE, INCENDIARY.) (N. F. S.)

**Murphy, Robert Daniel** (1894– ), U.S. foreign service official, was born Oct. 28 in Milwaukee. He entered the foreign service in 1917 and in 1930 was transferred to the Paris embassy as consul and later first secretary. After the collapse of French armies in June 1940, he followed the Pétain government to Vichy, there becoming a counsellor in the U.S. embassy and chief U.S. representative in French North Africa. Murphy was credited with having played an important role in preparing the groundwork for the U.S. invasion of French North Africa in Nov. 1942. For this work he was given the D.S.M. and was raised to the rank of minister. During the early part of 1943, under a storm of criticism from the U.S., Murphy worked toward a settlement of Giraud-De Gaulle differences, his goal being French unity and the establishment of a governing body that the U.S. would be willing to recognize. When the advisory council to the Allied Control Commission for Italy was formed in Nov. 1943, Murphy was appointed as the U.S. member with the personal rank of ambassador. In Aug. 1944 Murphy was made political advisor to Gen. Eisenhower to help set up and operate the machinery for the Allied military government of the reich. During the occupation of Germany in 1945, Murphy was again criticized in the United States, allegedly because he objected to imposing stringent peace terms on the defeated reich.

Murphy was believed to have state department concurrence for his views.

**Murray, Philip** (1886– ), U.S. labour leader. A native of Scotland, he was born in Blantyre May 25 and emigrated to the United States in 1902. Naturalized in 1911, he became a member of the international board of the United Mine Workers of America the next year, president of the union's fifth district in 1916, and international vice-president in 1920. In 1935 he was named to the National Industrial Recovery board and to the advisory council of the National Recovery administration. Murray, choice of John L. Lewis, succeeded him as C.I.O. president, Nov. 22, 1940, when Lewis fulfilled his pledge to quit if Roosevelt were re-elected. But Murray did not follow Lewis in his bitter opposition to Roosevelt's foreign policy. A split developed in May 1942, when Lewis ousted Murray as U.M.W.A. vice-president. Murray fought back, and the C.I.O. went along with him; Lewis and the mine workers walked out. In 1943 Murray fought to maintain the no-strike policy, to use manpower more efficiently, to streamline the War Labor board, to stabilize prices, etc. When congress refused to go along and instead enacted the Smith-Connally antistrike bill, the C.I.O. set up a Political Action committee which supported President Roosevelt for re-election in 1944. Immediately following conclusion of World War II, the C.I.O., under Murray's guidance, launched its campaign for continued high wages and better working conditions. Murray's program was to secure enactment of the full employment and unemployment compensations measures. He also advocated broader social security benefits, immediate wage adjustments, a minimum 65-cents-an-hour wage and establishment of fair employment practices on a permanent basis. In sponsoring the full employment bill (Aug. 22, 1945), he warned that if the U.S. people failed to get well-paid jobs, they would demand government operation of industry. During the wave of strikes that spread over the United States in late 1945, Murray attacked Pres. Truman (Dec. 4), declaring that the latter, in setting up fact-finding boards to investigate industrial disputes and make recommendations for their settlement, had yielded "in abject cowardice" to industry's rejection of collective bargaining.

**Museums of Art:** see ART GALLERIES AND ART MUSEUMS.

**Music.** Music was for the masses of people a most needed release from the tension of struggle and dread of fear. In Italy, France, Austria, Germany and the Low Countries concert halls were packed as never before and the numbers of performances increased. The quality of performance was unusually high for the performer realized and rose to the challenge. Not infrequently concerts were a method of resistance. An Austrian critic, living in Switzerland, writes in *Modern Music* (Vol. XXII, No. 4) of how the young musicians of Vienna sabotaged the cultural *Gleichschaltung* imposed by the Germans. The staff of the Vienna state opera, after its nazi director, Heinrich Strohm, suffered a nervous breakdown, produced the *Entartete Kunst* opera *Johanna Balk* by Rudolf Wagner-Regeny causing a political-cultural scandal. Goebbels himself issued a ban on performances of this work and tightened the nazi grip on musical affairs in Vienna by the appointment of Karl Bohn of Dresden as director of the Vienna state opera. A scandal was also caused when it became obvious that young musicians were attending the propaganda exhibit largely to listen to the recordings of "decadent music" which included examples from Arnold Schönberg's *Pierrot Lunaire* and songs from Bert Brecht and Kurt Weill's *Dreigroschenoper*. Secret performances of prewar Viennese composers were organized. Every young violinist learned the Mendelssohn-Bartholdi concerto even though the music was banned. It was reported that a German censor admitting that he must bar the work from a program suggested that if it were listed as *Concerto* by Bartholdi, then he too could attend the concert and enjoy the music. Vienna felt bitterly the loss of such great conductors as Bruno Walter and its great opera singers such as Lotte Lehmann, Elizabeth Schumann, Margit Bokor and Kolomon Pataky.

Belgium and France were particularly successful in resisting the propaganda efforts of the Germans. Concerts given by the conservatoires in both countries and by organizations of long tradition were constantly crowded, but only German soldiers and the diplomatic corps attended the gala occasions organized by the German *Propaganda Abteilung*.

Musical activity in Russia continued to demand attention. The composer who produced the most striking new works during the year was Serge Prokofiev. His opera *War and Peace* based on the great Tolstoy novel was scheduled for performance in Leningrad. His *Fifth Symphony*, performed in Moscow in January, was recognized as one of his greatest works. He was working on a *Sixth Symphony* which was scheduled for early performance in 1946. Both the seventh and the eighth *Piano Sonatas* were widely performed and were important contributions to piano literature. Besides these major works, he turned out several pieces inspired by World War II, the latest of which was *Ode on the End of War*.

Benjamin Britten's opera *Peter Grimes*, performed June 7 at the Sadler's Wells theatre, was not only this composer's most ambitious work so far, but the outstanding work of the English season and the first native opera to be performed in a good many years.

Bohuslav Martinu, who lived in the United States for five years, was appointed head of the state conservatory of music in Prague just 50 years after Anton Dvořák left the U.S. to fill the same position. Martinu's *Third Sonata for Violin and Piano* and *Quintet for Piano and Strings* were given their first performance during 1945. It was reported that European composers such as Darius Milhaud (whose new opera *Bolivar* was scheduled for performance in 1946) and Jerzy Fitelberg were planning to return soon to their native homes.

The birthdays of two great modern European composers were celebrated by festivals in the United States during 1945. Arnold Schönberg was feted on his 70th birthday with many perform-

SERVICEMEN LISTENING to the *Ave Maria* in 1945 during a concert at the Paris Opera house

ances of his music. His *Ode to Napoleon* and his *Piano Concerto* were given first performances and were recognized as works which must rank with the greatest that this unusual figure has contributed during his long career. Paul Hindemith was honoured on his 50th birthday with a festival of his music sponsored by the Juilliard school in New York city. This composer had been particularly productive during his exile in the United States. His *Symphonic Metamorphosis on Themes by C. M. von Weber*, a *Violin Concerto* and a *Quartet for Clarinet, Strings and Piano* were heard for the first time during 1945.

In the U.S. such a great quantity of new music was produced that it is quite impossible to report it all. New symphonies were written by Howard Hanson (*Third Symphony*), Robert Ward (*Second Symphony*), Paul Creston (*Second Symphony*), Lukas Foss (*First Symphony*), George Antheil (*Fourth Symphony*), Jerome Moross (*First Symphony*), John Verrall (*Second Symphony*), Walter Piston (*Second Symphony*), Ross Lee Finney (*Symphony Communique*), Norman Dello Joio (*Symphony for Voices and Orchestra*) and Ernst Levy (*Ninth Symphony*). Shorter orchestral pieces were written by Virgil Thomson (*Suite for Orchestra*), William Grant Still (*Old California* and *Poem for Orchestra*), Morton Gould (*Concerto for Orchestra*), E. B. Hill (*Music for English Horn and Orchestra*), Douglas Moore (*Village Music*), William Schuman (*Side Show for Orchestra*), Hugo Weisgall (*American Comedy '43*), Frederick Jacobi (*Night Piece*), John Alden Carpenter (*The Seven Ages*), Bernard Wagenaar (*Song of Mourning*), Robert Ward (*Adagio and Allegro*), David Diamond (*Rounds for String Orchestra*) and Aaron Copland (*Appalachian Spring*) to mention only a few. Concerti of various sorts by Louis Gruenberg (*Violin Concerto*), Lukas Foss (*Piano Concerto*), Nicolai Berezowsky (*Violin Concerto*), Ernest Gold (*Piano Concerto*), Nikolai Lopatnikoff (*Violin Concerto*) and a *Concerto for Theremin and Orchestra* by Anis Fuleihan were performed. Large choral works by Lukas Foss (*The Prairie*), Robert Delaney (*Western Star*) and Randall Thompson (*The Testament of Freedom*) made significant contribution to music in this field. A few of the interesting chamber music

works were Copland's *Violin Sonata*, Artur Schnabel's *Sonata for Violin and Piano*, Leo Sowerby's *Violin Sonata*, Igor Stravinsky's *Sonata for Two Pianos*, Ross Lee Finney's *Third Piano Sonata* and *Duo for Violin and Piano*, Elliot Carter's *Pastoral for English Horn and Piano*, Vittorio Rieti's *Piano Sonata in A flat*, Jacobi's *Rhapsody for Harp*, *Double String Quartet* and *Contrabass* and Otto Luening's *String Quartet*.

Leonard Bernstein's music for the Broadway show *On the Town* was a most refreshing new development in the interesting career of this young composer-conductor who was made director of the New York City Music Center. (R. L. Fy.)

**Popular Music.**—During 1945 the two most popular composers in the U.S. were Frederic Chopin and Richard Rodgers. The former became known to an entirely new audience, first through the biographical film, *A Song to Remember*, and then through the song, "Till the End of Time," derived from the "Polonaise in A-flat," with some help also from the stage musical, *Polonaise*, and a number of "simplified" publications of the Chopin music.

"Till the End of Time" must be considered the hit of the year. The writer of the words, Buddy Kaye, claimed a sale of more than 1,000,000 copies of the sheet music and about 2,000,000 records. It appeared on the Hit Parade for 19 consecutive weeks, seven times at the top. A most encouraging angle of this extraordinary success was that while the sentimental fox trot version of Chopin's heroic masterpiece was the country's number one popular song, the "Polonaise" itself, as originally composed, ranked as number 15, with an apparently inexhaustible demand for its piano recordings. Chopin's "Fantasie Impromptu in C# minor" also had a screen revival through the old Harry Carroll version, "I'm Always Chasing Rainbows" (now credited to Harry Fox) and his "Minute Waltz" and other pieces enjoyed considerable popularity.

The consistent success of Richard Rodgers and his new song-writing partner, Oscar Hammerstein II, gave further evidence of the U.S. improved taste in popular music. Their great musical comedy *Oklahoma!* continued to sell out on Broadway, with *Carousel* keeping pace and adding another smash hit to their collection in "If I Loved You," a song far above the general standards of Tin Pan alley. This number made the Hit Parade 18 times, heading the list for three weeks.

The Rodgers-Hammerstein motion picture, *State Fair*, was unquestionably the best film musical of the year, containing several good songs, of which two became national hits: "It Might as Well be Spring" and "That's for Me." A new record was established when these two numbers appeared simultaneously with "If I Loved You" on the Hit Parade, making a total of three out of nine by the same writers, never before equalled in the history of this popular radio program.

The musical standards of Chopin and Rodgers were not seriously challenged by any other composers of the year's popular music. Most of the material was either commonplace or obviously derivative, and in many cases the words were more effective than the music. Johnny Mercer showed his skill as a lyricist by successfully spoofing the psychiatric lingo in "Ac-cent-tchu-ate the Positive," whose tune merely revamped "Praise the Lord and Pass the Ammunition," with "The Old Grey Mare" as a common ancestor. The lyrics were also exceedingly helpful to the conventionally catchy music of "Sentimental Journey" and the latest railroad paean, "The Atchison, Topeka and the Santa Fe."

The good old subject of dreams received more than its share of attention from the song writers, with rather surprising success. Early in the year there was a run on "My Dreams are Getting Better All the Time," and a little later a song called merely "Dream" headed the Hit Parade five times and equalled

the year's record of 19 appearances on that highly regarded list. "I'll Buy that Dream," another new twist to a hackneyed idea, won considerable popularity toward the end of 1945. The weekly guidebook of show business, *Variety*, listed 35 songs among the best sellers of 1945. Of these the pseudo cowboy "Don't Fence Me In" carried on the vogue established in 1944, with Lawrence Tibbett succeeding Frank Sinatra as its high priest. A melody somewhat above the commonplace, combined with the appeal of a popular film title, brought success to "Laura." The psychology of the returning soldiers and sailors found expression in "It's Been a Long, Long Time" (still going strong at the end of 1945) and "I'm Gonna Love that Guy," whose physical import was unmistakable. The navy had its own tribute in a revival of the ancient "Bell Bottom Trousers;" with the words cleaned up.

"Rum and Coca-Cola" (with radio and some records substituting "lime" for the stronger mixture) came directly from the Calypso music of Trinidad and was also the subject of violent litigation. The milder "Candy," apparently lacking in all the necessary qualifications for popularity, had a mysterious career that even its publishers failed to explain. "Chickery Chick" made a feeble attempt to capture the nonsense prize for the year with practically no competition. A late arrival, marked for increasing popularity, was the foreign importation, "Symphony," whose authorship was also hotly disputed. (S. Sr.)

Cole Porter's "Don't Fence Me In" led the ten ranking song hits of the 1944-45 season, according to the annual survey of the radio division of the office of research. The results of the survey were based on the size of the "listening audience" to which the tunes were played. Other hits, in order, were: "I Dream Of You," "Trolley Song," "Ac-cent-tchu-ate the Positive," "There Goes that Song Again," "I'll Walk Alone," "A Little On the Lonely Side," "I'm Beginning to See the Light" and "More and More." Favourite standard songs were led by Cole Porter's "Begin the Beguine." Top patriotic favourite was "Anchors Aweigh" followed by "The Army Air Corps Song" and "The Marines' Hymn." "The Army Air Corps Song" was the only one of the three written during World War II. (X.)

**Music in Industry.**—Use of music as a palliative to weariness is as old as history. In the United States the work songs of the Negro of the south are a striking example. Similarly, the sea chantey for many generations lightened the task of the sailor. Music in industry merely reverses the process; the worker does not sing, he is sung to.

Many thousands of plants in England and the United States were in 1945 equipped to distribute music to their various departments. Similarly, commercial enterprises introduced music into their accounting rooms to counteract the boredom of concentration upon figures. There were instances of banks, insurance companies and other similar enterprises whose employees accomplish their daily tasks to the accompaniment of subdued music.

There also appeared to be a growing enthusiasm among the workers for this attractive new element in the daily routine. Music often was extended beyond the work period into lunch hours and rest periods on the theory that the worker, diverted by music, returns to his task with renewed spirit.

The general use of music in industry is a direct result of the British government's concern with the welfare of war workers. The British Broadcasting company, which unlike the U.S. networks is a government operation, was called upon by the government to broadcast at certain hours music suitable for use in industrial plants, it having been found that these plants through lack of familiarity with the problems involved were defeating the purposes of "music-while-you-work" through basic mistakes, chiefly faulty programming. Beginning in the summer of 1940, the project spread through virtually all English plants in war work and rapidly was taken up by other English industries.

United States industry soon adopted the plan.

The claim was made that programming could be standardized to meet the varying requirements of almost all industry. Certain fundamentals were known. Fast music does not mean fast work. A sharply defined melody is preferable to rich orchestration. A slow waltz tempo is favoured a few minutes before the usual midmorning or midafternoon fatigue period. Instrumental music is preferred, for the listener often is distracted in an effort to follow the spoken word. (See also RADIO.)

**Mussolini, Benito** (1883-1945), Italian leader and dictator, was born July 29 at Dovia, Forlì province. For his earlier career see *Encyclopædia Britannica*. Il Duce brought Italy into World War II as an axis partner on June 10, 1940, when the defeat of France was a *fait accompli*. In the realm of military leadership, Mussolini was a failure. His armies were soundly thrashed in North Africa and Greece. He frequently shuffled his high command in the hope of finding a winning combination, but without success, and the Italian army remained a model of corruption and ineptitude.

After the Allied landings in Sicily in 1943, Mussolini's prestige among the Italian people had fallen so low that there was little protest when he was ousted, July 25, from the office of premier which he had held for 20 years. He was imprisoned by Marshal Pietro Badoglio, the new premier, but was spirited away by German paratroopers. In Sept. 1943 he formed a new "Republican fascist" government in northern Italy under German protection. Mussolini made occasional speeches in which he voiced his ultimate faith in an axis victory, but as the axis stumbled from defeat to defeat, it was obvious that the erstwhile dictator was "whistling in the dark."

Toward the end of April 1945, when the United Nations armies were overrunning all of Europe, strong partisan forces rose up in northern Italy and Mussolini, panic-stricken, fled northward from Milan, presumably toward neutral Switzerland or to Adolf Hitler's redoubt in Bavaria. With him were his mistress, Clara Petacci, and several high fascist officials. But the duce and his party were intercepted by a body of Italian partisans near Dongo, a village near Lake Como. The partisans held a trial and sentenced him to die before a firing squad, and Mussolini, 16 of his fascist henchmen and Signorina Petacci were executed on April 28. Their bodies were brought to Milan by truck and dumped into the Piazza Loretto (where Mussolini's agents had previously executed 15 Italian partisans) for public display. The corpses of the fallen dictator and his mistress were later strung up by their heels in the square, but were finally taken down and buried in the pauper's section of the Cimitero Maggiore in Milan, May 1.

## National Association of Evangelicals.

An association of Protestant denominations in the U.S. formed in May 1943, to provide a means of co-operation in fields of common interest. Its membership, as of Dec. 1945, included 20 denominations, a large number of single churches of other

denominations, mission boards, educational institutions and other evangelical organizations. Its operations are carried on largely through nine affiliated corporations and commissions including Evangelical Foreign Missions association, National Radio Broadcasters, National Sunday School association, Chaplain Counselors for Industry, Commission for Evangelism, Commission for War Relief, Commission for Christian Educational Institutions, National Youth commission, Commission for Chaplaincies. Its doctrinal position is strongly conservative. The official organ is *United Evangelical Action*, published semi-monthly at 903 St. Paul building, 111 East Fourth St., Cincinnati. It is not endowed. Offices are maintained in New York city; Newark, N.J.; Washington, D.C.; Buffalo, N.Y.; Detroit, Mich.; Cincinnati, O.; Chicago, Ill.; Los Angeles, Calif.; and Portland, Ore. Its principal office is at 120 Tremont St., Boston, Mass. The officers in 1945 were: Bishop Leslie R. Marston, president; Rev. R. L. Decker, 1st vice-president; Dr. J. Alvin Orr, 2nd vice-president; J. Willison Smith, Jr., secretary; H. J. Taylor, treasurer. Dr. J. Elwin Wright was the national executive secretary. (J. E. Wt.)

**National Education Association** of the United States during 1945, the second year of its program of unification, expansion and development, made the greatest growth in its history. It had an important part in securing a place for education in the United Nations charter. Association leaders had a part in the London conference which drafted the charter for the United Nations Educational, Scientific and Cultural organization. N.E.A. added three new service divisions to its headquarters staff to deal with adult education, audio-visual instruction and travel. The *Journal of the N.E.A.* more than doubled in size after the removal of wartime restrictions made it possible to obtain more paper. The campaign for federal aid made more progress toward agreement in both house and senate than during the 25 years the proposal was before congress. "How To Promote The General Welfare" was the theme for American Education week Nov. 11-17, 1945. Because of travel restrictions, regional conferences were substituted for the 1945 conventions and association officers continued for another year. Among new publications inaugurated by the association during the year were the *N.E.A. Handbook*, the *N.E.A. History* and a bulletin for laymen entitled *The Public and Education*. The association also made and distributed its first moving picture on the schools entitled, *Assignment: Tomorrow*. The association was organized in Philadelphia in 1857. It had, in 1945, a membership of 331,429 and its affiliated state associations had a membership of 757,265. The official organ is *The Journal of the N.E.A.*, edited in 1945 by Joy Elmer Morgan, and issued to all members monthly except June, July and August. The president for 1944-46 was Dr. F. L. Schlagle, superintendent of schools,

Kansas City, Kan.; executive secretary, Willard E. Givens. (See also EDUCATION.) (J. E. Mo.)

**National Geographic Society.** Organized in 1888 by a small group of professional geographers resident in Washington, D.C., this society's purpose was set forth in its charter as that of "increasing and diffusing geographic knowledge." Gilbert Grosvenor, president in 1945, assumed the direction of the organization's activities in 1899 and broadened the scope of its researches to appeal to the layman interested in scientific accomplishments. The membership of the society, which was less than 1,000 in 1899, was 1,300,000 in 1945.

As one method for carrying out the purpose for which it was established, the society issues monthly its official publication, the illustrated *National Geographic Magazine*. During the 57 years of its existence, the society sent numerous expeditions to various parts of the earth to gather data in the fields of geography, geology, volcanology, glaciology, archaeology, astronomy, meteorology and other sciences associated with geography. The scientific results of these expeditions were recorded in a series of published monographs.

In 1945 the National Geographic society, under the leadership of Dr. Arthur A. Allen, sent its second annual expedition for the study of North American bird life. Investigations were made along the north shore of the Gulf of St. Lawrence (Quebec province, Canada) and at Canadian bird sanctuaries on the offshore islands. Natural colour photographs were made of murre, cormorants, eiders, puffins, auks and red-throated loons in their nesting areas.

During the year studies of the aurora borealis were continued by the society and Cornell university under the direction of Dr. C. W. Gartlein. Headquarters of the project were at Ithaca, N.Y., and supplemental bases at Hamilton and Geneva in the same state. With the co-operation of 25 stations scattered from eastern Canada to Oregon and from Ithaca to a point north of Lake Superior, visual observations of auroras were made from some of the stations when the displays were obscured by clouds elsewhere. By the development of photoelectric instruments the project's observers also detected and recorded automatically the presence of auroras hidden by heavy clouds.

In pursuing its archaeological investigations into the Olmec culture, the society, in co-operation with the Smithsonian institution, carried on field work in 1945 in the highlands of the state of Chiapas, Mex., near Tuxtla Gutierrez. A series of eight mounds was excavated and explorations were conducted in a number of caves which had been used as dwellings or refuges. The party also blocked out for future study a new site on the Rio Chiquito in southern Veracruz state, rich in gigantic carved stone heads, altars, monuments and other art objects.

During 1945 four 10-colour wall maps were produced by the society's cartographic department. More than 5,000,000 of these maps were issued to members as supplements to the *National Geographic Magazine*. The map of the Philippine Islands appeared while military activities were still in progress in those islands. Incorporated in this chart were data assembled over a period of 40 years by the U.S. coast and geodetic survey and the army map service, and saved from loss to the Japanese invaders only by shipment from Corregidor in a submarine. The map of China includes Outer Mongolia, whose independence was recognized in Aug. 1945, and Manchuria, scene of post-V-J day

civil strife. Numerous Chinese dialects were sifted in order to arrive at the spellings of the thousands of place names used on the map. The map of Japan and Korea is a large-scale representation of the home islands of the once sprawling Japanese empire and the peninsula which was its closest and most important mainland possession. Insets show Karafuto, which is the southern portion of Sakhalin Island, Formosa, the Ryukyu and Kurile Island chains, Okinawa and Tokyo and its surroundings. The map of northeastern U.S. embraces only 12% of the area of the union but nearly half its total population and nearly three-fourths of its factory production. The part of Canada included holds two-thirds of the total population and nearly three-fourths of the factories of the dominion. The chart contains 10,437 place names, a greater number than had appeared on any other map published by the National Geographic society.

Franklin L. Burr prizes, each carrying an award of \$1,000, were granted to Dr. Lyman J. Briggs, for outstanding work in directing field expeditions of the society; and to Dr. Thomas A. Jaggar for developing the first "duck" or amphibian mobile boat in 1927. The latter was a combination boat and automobile used for coastal explorations near Pavlof volcano in Alaska.

The National Geographic society's headquarters are at 1146 Sixteenth St. N.W., Washington 6, D.C. Officers in 1945: president and editor, Gilbert Grosvenor; vice-president and associate editor, John Oliver La Gorce; secretary, Thomas W. McKnew; and treasurer, Robert V. Fleming. (G. Gr.)

**National Guard.** It was possible at the end of 1945 to summarize to the end of World War II. Upon induction into federal service in 1940-41, the guard furnished 300,000 officers and enlisted men to the war mobilization. During the war large numbers of these were transferred to new duties to furnish seasoned personnel to new units being formed. A high proportion of its enlisted men were commissioned. It was estimated that the guard furnished 100,000 officers to the general military effort. Statistics were not available regarding the later records of enlisted categories, but Table II concerning the original officer personnel is significant.

Table I is the war record of the national guard divisions. It does not include the records of many national guard non-divisional units which served as artillery headquarters, as separate artillery, anti-aircraft and tank destroyer battalions, and as other combat and supporting organizations, the number

Table II.—Original Officer Personnel

Number of officers inducted	20,920
Officers promoted after induction	20,069
Awarded decorations	1,339
Still in federal service (May 8, 1945)	16,580
Still in federal service (Aug. 14, 1945)	16,169
Still in federal service (Dec. 31, 1945)	15,066
Killed in action	334
Died of wounds	64
Retired for physical disability	489

of which is too great for detailed inclusion here.

During 1945 the war department established new policies for the organization of the postwar-national guard in order to integrate it more fully into the peacetime defense scheme as an efficient first line force.

Under the act of congress approved Oct. 21, 1940, the various states continued to maintain state guard units for local security while their national guard units were absent in federal service. In Aug. 1945, this force had a strength of 149,348 officers and men. After hostilities ceased, this strength declined to 140,205 on Nov. 30th. In support of these units, the states appropriated for 1945 the sum of \$17,943,056.80. Summer training camp attendance during the year was 61,000, and special part-time schools extended training to reach nearly every state guardsman. New transportation and communications equipment issued to the state guard in 1945 increased its field efficiency.

**National Labor Relations Board.** On July 5, 1935, President Roosevelt signed into law the National Labor Relations act protecting the workers' right to organize and bargain collectively in the United States.

Popularly known as the Wagner act, it is a simple law. It applies to interstate industries only; government, agricultural and domestic workers are exempted from its provisions.

The act established a National Labor Relations board and entrusted its three-member board with two basic functions: (1) to conduct secret ballot elections; and (2) to eliminate and remedy those practices by employers which discriminate against employees in any manner because of union membership or activity.

Section 8 of the act specifies those unfair acts of employers

THE NATIONAL LABOR RELATIONS board conducting a strike poll under the Smith-Connally act, at the request of Chicago teamsters' unions on June 15, 1945

which deny, abridge or interfere with the employees' right to bargain collectively. Under this section, employers are specifically prohibited from interfering with, restraining or coercing employees in the exercise of their rights to organize and bargain collectively; dominating or interfering with the formation of any labour organization; discriminating against any employee to discourage or encourage membership in a labour organization; discharging or otherwise discriminating against an employee because he has filed charges or given testimony under the act; and, lastly, employers are prohibited from refusing to bargain with the representatives selected by a majority of employees in an appropriate bargaining unit.

In the ten years after the act appeared on the statute books, 77,231 cases were filed with the board. Of these, 37,306 involved unfair labour practice charges and 39,925 concerned questions of representation.

The board endorses and stresses the use of informal procedures for the achievement of results consistent with national policy. Thus, of the total of 77,231 cases handled, 62,712 or 81.2% of them, were disposed of informally, without the necessity of hearings, decisions or subsequent court litigation. Taken separately, more than 90% of the unfair labour practice cases handled were so settled; of the representation cases, 72.6% were so adjusted.

In the 1945 fiscal year, as in the preceding 12 months, more election cases were filed with the board than in any single year of the board's history. Of the 9,737 cases that came before it, only 2,427, or less than 25%, involved questions of unfair labour practices; the remaining 75.1%, or 7,310 asked for board resolution of questions concerning union representation.

The magnitude of the board's election job and the workers' interest in it can best be seen by the fact that in the first ten years of the board's existence more than 6,000,000 workers went to the polls to vote in board-conducted elections. Approximately 24,000 such elections were held during that period.

In 20,000 elections a majority of employees voted for a union; in 9,545 polls the Congress of Industrial Organizations was successful in obtaining representation rights; American Federation of Labor affiliates scored in 7,945; unaffiliated unions were chosen in 2,510; and no union was selected in the remaining 3,850 balloting.

The returning serviceman, when viewed through the operations of the act, is considered in the same light as a civilian worker; he is treated as an employee who temporarily finds himself in his country's uniform and who, upon his return to his bench, will be entitled to the same rights as he always enjoyed.

Inasmuch as the board's basic functions impinge upon the serviceman, the board has had occasion to hand down rulings to the effect that: Individuals who are in uniform do not cease to be employees of their last employer before they entered the armed forces. Employees who have been discriminatorily discharged prior to their military service must be offered full reinstatement upon their return to civilian status. Employees who are in the armed forces, whenever administratively feasible, will be permitted to cast their ballots in elections for the determination of representatives to act as bargaining agents. Whenever a labour organization is certified by the board as exclusive bargaining agent, the certification is made subject to review when a sufficient number of employees have returned from military service.

Before the board can certify a representative it must first ascertain which employees comprise an appropriate unit for collective bargaining purposes. Under the act, the employer, craft, plant unit or subdivision thereof may be found appropriate. An appropriate unit also may be composed of employees of one plant, several plants or all the plants of one employer. Similarly, employees of one or more crafts or departments may form an appropriate unit.

Among the more important factors considered by the board in arriving at a unit determination are the following: the history, extent and type of organization of the employees; the history of their collective bargaining; the history, extent and type of organization of employees in other plants of the same employer, or other employers in the same industry; the skill, wages, work and working conditions of the employees; the desires of the employees; eligibility of the employees for membership in the union or unions involved; and the relationship between the unit or units proposed and the employer's organization, management and operation.

Only 6,900 of the 24,000 elections held during the 1935-45 period were conducted pursuant to orders of the board; the remainder, or 72% of all elections, were based and conducted on the complete agreement and mutual arrangement of the parties.

In Nov. 1945, with 2,100 bargaining elections on its docket, the board adopted a new policy to expedite the disposition of reconversion representation issues. This policy, in the form of an addition to the board's existing rules and regulations, made it possible for representation elections to be conducted in certain types of cases without awaiting a formal direction of election by the board in Washington; any necessary hearings were held after the conduct of the election by the board's agents. The board's purpose was to remove quickly any simple questions of majority representation from the area of industrial strife since many of the cases pending before it were and would continue to be tied in with industrial reconversion efforts. In making the change the board noted: To the extent that these representation questions are promptly answered, that the employer knows with whom he is to bargain and that employees realize that they can designate representation to settle

shop problems, to that extent will the board have furthered reconversion to full-time production of civilian goods.

To correct unfair labour practices, the board is authorized to issue cease and desist orders and to take such affirmative action, including reinstatement with or without pay, as will effectuate the policies of the act. Of the 11,000 formal decisions issued from 1935 to 1945, comprising more than 60 bound volumes, 2,600 concerned employer unfair labour practices. To remedy illegal practices the board ordered the reinstatement of 300,000 employees, 30,000 of whom received back pay. These compensatory pay awards totalled \$9,000,000. More than 2,000 company unions were ordered disestablished. In 5,000 cases collective bargaining was ordered, while in 7,000 cases notices of compliance with board decisions were directed to be posted. These posted notices informed employees that they were free to engage in collective activity without interference, as guaranteed by the act.

Decisions and orders of the board are not self-enforceable. There are no penalties or fines. Either the company or the board may petition the appropriate circuit court of appeals for enforcement. Following this, either party may petition the supreme court for review. It is only after a court has upheld a board order and an employer has refused to comply that he may be held in contempt of court and subject to court penalties.

As of Oct. 1, 1945, more than 600 board cases had been litigated in the various circuit courts of appeals and in the supreme court. In the circuit courts, 343 of these were upheld in full, 78 were set aside and 167 modified. Of the 55 that reached the supreme court, board orders were enforced in full in 52 cases; in only 2, or less than 4%, were board orders set aside.

An additional duty was given the board by congress during 1943. This was the conduct of strike votes in accordance with Section 8 of the War Labor Disputes act. From the date of the passage of this act, June 25, 1943, up to Dec. 1, 1945, a total of 4,260 dispute notices were filed. Of these, 2,293 were withdrawn before the end of the 30-day period stipulated by the statute. Strike polls were conducted by the board in 1,306 instances, and on Dec. 1, 1945, 606 such cases were pending before the board.

In Nov. 1945 alone, 578 of these strike petitions were filed. This influx of strike vote petitions caused the board to protest to congress that the conduct of such votes had become administratively impossible. The board pointed out that its work of conducting NLRA elections, intimately tied in with orderly reconversion of industry to peacetime production, was being neglected because of the time and money required for the handling of War Labor Dispute act cases, and called upon congress to repeal the section requiring the board to conduct the strike votes. (See also LABOUR UNIONS; LAW; STRIKES AND LOCK-OUTS.)

**National League of Women Voters:** see SOCIETIES AND ASSOCIATIONS.

**National Mediation Board.** The National Mediation board, an independent federal labour agency in the United States, operates under the Railway Labor act, passed in 1926 and amended in 1934. The principal function of the board and its field staff is to settle, through mediation, disputes between rail or air carriers and their employees over changes in wages and working conditions. The board is also charged with investigation and certification of disputes arising among employees as to who are the representatives designed to act as the bargaining agency for a craft or

class of employees. During 1945, the board disposed of 617 cases, 227 representation disputes and 390 disputes involving changes in rates of pay, rules or working conditions. It received during the year 457 cases.

Where disputes over changes in wages and hours are not resolved by mediation, and the board's proffer of arbitration is declined, the board is required to advise the president of the United States of such disputes which threaten substantially to interrupt interstate commerce. The president may, in his discretion, appoint a fact-finding emergency board to investigate the controversy. During the year 13 such emergency boards were created and recommended settlements to the president.

The U.S. supreme court in a 5-4 decision (*Elgin, Joliet and Eastern Railway Company v. G. W. Burley, et al.*) in June 1945 held that for union representatives of railroad employees to handle grievance cases arising over the application of existing agreements it was necessary for such representatives to obtain adequate authorization from each individual aggrieved employee. This decision ran contrary to customary union procedures and largely because of the resultant widespread dissatisfaction, the court reheard the case in December. No decision had been announced by the end of the year.

**National Railway Labor Panel.**—This agency, created by executive order of the president for the World War II period, provides a means whereby disputes involving air or rail carriers and their employees which may interfere with the war effort and which are not settled by mediation or arbitration may be heard by emergency fact-finding boards if employees refrain from threatening strike action. Such boards are appointed by the chairman of the panel from a roster of about 30 outstanding individuals who have no connection with the industry or the employee unions. Seventeen panel emergency boards were appointed in 1945. The chairman also is authorized to determine the permissibility, under the government's wage stabilization program, of voluntary (nondispute) applications for wage changes involving employees covered by the Railway Labor act. (See also RAILROADS.)

(N. M. Bz.)

**National Museum:** see SMITHSONIAN INSTITUTION.

**National Parks and Monuments.** The end of World War II found the national park areas in the U.S. relatively undamaged by the demands of war. The national park service policy of protecting the parks, and refusing permits for exploitation of the natural resources within the parks unless national necessity demanded, successfully averted threatened damage from mining, logging and grazing.

Lifting of gasoline rationing caused an upward surge in travel to the parks. In several instances, fall travel surpassed previous travel for any similar periods and Labour day week end in the major parks brought crowds comparable to the peak period in a normal prewar year. Total travel for the 1945 travel year (ending Sept. 30) was more than 10,000,000, about half of the prewar high figure of 21,000,000 in 1941. Because of the wartime curtailment of park appropriations, and emphasis on minimum essential maintenance only, these visitors did not find accommodations and services similar to those maintained before the war. With additional funds expected in postwar budgets, the national park service was expected to resume normal service as rapidly as possible to repair and rebuild deteriorated roads, reopen campgrounds and trails and repair park buildings. The operators of hotels and cabin camps in the parks faced a similar problem of rehabilitation since most of these facilities had not been opened during war years.

On May 8, 1945, the "Statue of Liberty" was relighted after

FORT FREDERICA, Georgia, was established as a U.S. national monument on Aug. 30, 1945

a black-out lasting more than three years. This symbol of democracy again stood as a beacon of welcome to men returning from the battlefields of Europe.

One new area was added to the park system during 1945 with the establishment of Fort Frederica national monument, Georgia, on Aug. 30. This is one of the early southern outposts of the Georgia colonists, built for military protection against the Spanish in Florida.

Artificial feeding of bears in Yellowstone and Yosemite was eliminated during the year, better to portray the wildlife of the parks in a wholly natural setting. This move was expected to help eliminate unnatural concentrations of the bear population, would permit them to fend for their own food and was expected to reduce accidents to visitors resulting from unwise familiarity with the bears.

More than 300 acres of virgin timber in Mt. Rainier national park was purchased for addition to the park during the year. This timber was in imminent danger of logging operations, and its acquisition was another step forward in the land acquisition program of the national park service which planned the ultimate acquisition of all of the 600,000 acres of privately owned lands within the park boundaries.

Unusually severe dry lightning storms during late August threatened the northwestern parks with the worst fire season in many years, but prompt action kept total acreage burned well below average. In general, man-caused fires in the parks decreased during the war years.

**Naval Academy, U.S.** The United States Naval academy, at Annapolis, Md., was founded in 1845, and is maintained by the government, under the immediate supervision of the bureau of naval personnel of the navy department, for the training of young men for the naval service. The students at this institution are called midshipmen. They are given a general and professional education of collegiate grade, and sufficient basic naval and military training to enable them to enter upon the duties of ensigns in the navy or second lieutenants in the U.S. marine corps. All students pursue the same course, and upon graduation the midshipmen are awarded the degree of bachelor of science.

Midshipmen are appointed to the Naval academy from civil life after being nominated by a senator, representative, or delegate in congress, and after meeting all mental and physical entrance requirements. In addition, there are certain appointments from the United States at large, the District of Columbia, and the naval service, made by the president, the vice-president and the secretary of the navy.

Complete details regarding scholastic admission requirements are contained in the pamphlet entitled "Regulations Governing the Admission of Candidates into the U.S. Naval Academy as Midshipmen," copies of which may be obtained direct from the Office of the Superintendent, U.S. Naval Academy, Annapolis, Md., or from the Bureau of Naval Personnel, Navy Department, Washington 25, D.C.

Candidates for appointment as midshipmen must be citizens of the United States, not less than 17 years of age nor more than 21 years of age on April 1 of the calendar year in which they enter the Naval academy. They are required to have a good moral character and to be physically sound.

Upon admission to the Naval academy all candidates are required to make an entrance deposit of \$100, to be used as part payment to cover cost of uniforms, clothing, textbooks and incidentals. Midshipmen are allowed 5 cents a mile for travelling expenses from their homes to the Naval academy. This money is credited to their accounts after they have actually become midshipmen. The pay of a midshipman is \$780 a year, commencing at the date of his admission, and is sufficient to meet all his expenses while at the Naval academy.

The membership of the regiment of midshipmen at the beginning of the academic year 1944-45 was 3,043. (For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (Ro. M.)

**Navies of the World.** Development of naval weapons and equipment, as well as of warship design and tactics was greatly stimulated by World War II. Quite the most far-reaching of these developments was radar, the official term which replaced the former expression, radio-location. It is no exaggeration to say that radar completely changed the face of naval warfare. Victory at the battle of Matapan could hardly have been achieved without its aid, though at that time radar was still at a comparatively elementary stage.

Other inventions which can receive but brief mention include the human torpedo, used in different forms by both the Allies and the enemy; this reference applies equally to midget submarines, and to the electric torpedo which leaves no track. Mines of magnetic and acoustic types, and ingenious combinations of both principles were first used by the Germans, but were greatly improved by the Allies. Another device employed by the former was the acoustic homing torpedo, attracted to a ship by the propeller's vibration, but means to counteract this were soon found. Radio was also the subject of many improvements, which it would take too long to detail. Anti-submarine equipment was considerably improved, though details remained in 1945 mainly confidential.

Aircraft carrier design was modified to a notable extent. Small carriers of the escort type, which could be built quickly, were an important factor in winning the battle of the Atlantic, enabling the mid-ocean gap between the extreme ranges of shore-based aircraft on either side to be bridged. At the other end of the scale were the three immense aircraft carriers "Midway," "Coral Sea," and "Franklin D. Roosevelt," displacing 45,000 tons and carrying exceptionally heavy bombers, completed for the United States navy in 1945-46.

Escort vessels of special design, known as destroyer-escorts, frigates and corvettes, greatly aided victory in the battle of the Atlantic. For the invasion of enemy territories, sundry special types of landing craft were designed, ranging from the huge L.S.D. (landing ship, dock) to the little L.C.A. (leading craft, assault). One of the most useful of these, employed for covering a landing, was the L.C.T. (R.), or landing craft, tank (rocket). One of these vessels could project a very large number of rockets at a single discharge, giving a concentrated volume of fire equal roughly to that of 30 light cruisers each armed with 12 guns of 6-in. calibre.

Attack on vessels from the air, either by torpedo or bomb, reached a high stage of development, producing a corresponding enhancement of the anti-aircraft armament of warships. Immense numbers of 20-mm. and 40-mm. guns were turned out by U.S. naval arsenals for this purpose, the number of such weapons

carried in the latest U.S. battleships ranging in 1945 from 100 to 150.

With the approaching completion of the fifth ship of the "Iowa" class, the U.S. navy would possess 24 battleships. It was proposed to retain 18 of these in the postwar fleet, 7 of which would be kept in reserve. There were also at the end of 1945 two battle cruisers and a third completing for service. This would give a postwar total of 21 capital ships, as compared with the prewar figure of 15, which showed a 50% margin of superiority over Japan.

For practical purposes the axis navies had been eliminated. At the close of the war two cruisers were the only undamaged ships of any size left to the Germans, while the Japanese could muster only a single cruiser completely intact, with a few other units more or less disabled. Though at the end of 1945 the future of the Italian navy had still to be announced, it seemed improbable that Italy would be permitted to keep under its control the five battleships and nine cruisers that remained afloat; for this would make it the strongest continental naval power in Europe.

Defeat of the three axis countries can be attributed mainly to the superior sea power, correctly employed, of the British and United States navies. Germany voluntarily devoted all its resources to the prosecution of the submarine campaign against shipping. While this constituted for a considerable time a very dangerous menace, it was essentially a gamble which, in the absence of strong support from a surface fleet, was ultimately defeated by the combined resources of the United Nations. Italy's share in operations was that of a minor and almost completely subservient partner, whose aid became of less and less consequence as the struggle became more intense.

Japan's entry into the war threatened for some months to disrupt communications between Britain and the United States on the one hand and India on the other. Such scanty sea forces as were available in the Indian ocean were temporarily withdrawn to a remote base at Mombasa, in East Africa; but after one critical moment in April 1942 the Japanese seem to have relinquished any schemes they may have had for seizing control of the seas beyond the Straits of Malacca. This gave both the principal Allies breathing space in which to restore the situation; and the battle of Midway, in which the Japanese lost four of their best aircraft carriers, proved the turning point of the eastern war.

A very important factor in the defeat of Japan was the destruction caused by U.S., and at a later period, British submarines. Not only was the Japanese mercantile marine reduced to such inferiority that it could no longer maintain communication between the scattered territories held by the enemy, but also quite a considerable number of warships fell victims to Allied submarine attacks. These included 1 battleship, 9 aircraft carriers and 14 cruisers. Unable any longer to maintain control over its sea communications, Japan was in a plight which made surrender inevitable. Its industrial resources were so greatly inferior that it was impossible to replace more than a fraction of the maritime losses suffered; in this respect the contrast with the position of the U.S. after Pearl Harbor could hardly be more striking.

**United States Naval Strength.**—One of the results of World War II was to make the United States navy the largest in the world. As reconstituted at the end of 1945 it comprised 18 battleships; 2 battle cruisers (with a third building); 37 fleet aircraft carriers; 79 escort carriers; 31 heavy cruisers; 48 light cruisers; 367 destroyers; 200 submarines; 296 destroyer-escorts; and a large but not precisely specified number of minelayers, minesweepers, patrol vessels and miscellaneous auxiliaries of all kinds. Of this total, it was intended to lay up in reserve 7 of

the older battleships; 22 fleet carriers and 58 escort carriers, all built after 1940; 14 heavy and 19 light cruisers; 191 destroyers; 256 destroyer-escorts; and 110 submarines, together with a substantial proportion of the other categories mentioned above. This would comprise about 60% of the entire fleet. Moreover, a certain number of the ships maintained in commission would be kept in the ready reserve, with nucleus crews amounting to about one-third of full peacetime strength. Thus the fully manned ships in service would amount to about 28% of the whole fleet.

Losses during the war totalled about 700 vessels, including 2 battleships, 5 fleet aircraft carriers, 6 escort carriers, 7 heavy cruisers, 3 light cruisers, 71 destroyers, 11 destroyer-escorts and 52 submarines.

Total personnel at the end of 1944 reached the figure of 3,870,039, including the marine corps and coast guard. It was planned to reduce this figure to 550,000 by the summer of 1946.

**British Naval Strength.**—At the end of 1945 the strength of the royal navy was 13 battleships and 1 battle cruiser. Four of the battleships had been relegated to harbour training duties. One battleship was known to be under construction. There were 14 first-line aircraft carriers, with about the same number building; and 42 carriers of the maintenance or escort types, including 35 built in U.S. shipyards under the lend-lease scheme. There were 63 cruisers, including 11 old ships overdue for replacement, with 4 more under construction. Other vessels included 300 destroyers, of which 25% were earmarked for scrapping; 150 submarines; 4 minelayers; 70 sloops; 245 frigates; 250 corvettes, many of which were likely to be discarded; 290 fleet minesweepers; 4 monitors; 2 netlayers; and a large number of coastal craft, trawlers and auxiliaries of all kinds. No progress appears to have been made with the construction of four battleships of the "Lion" class, of more than 40,000 tons, that were authorized before the war. Losses during the war included 3 battleships; 2 battle cruisers; 5 fleet aircraft carriers; 3 escort carriers; 30 cruisers; 3 minelayers; 138 destroyers; 73 submarines (excluding midgets); 16 sloops; 12 frigates; 33 corvettes; 35 fleet minesweepers; 1 monitor; 11 gunboats; 16 armed merchant cruisers; 170 coastal craft; 1 coastal minelayer; 43 coastal minesweepers; 15 armed yachts; 270 trawlers and whalers; 50 drifters; 4 boom defense vessels; 17 oilers; 10 tugs; 46 miscellaneous auxiliaries; and an unreported number of landing craft, etc. The total amounted to well over 1,000 vessels.

In the above figures are incorporated the naval forces of the dominions, the strength of which was largely increased during the war. Thus the royal Canadian navy reached a total personnel of 90,000; the royal Australian navy, of 35,000; and the royal Indian navy, of 30,000. These figures would naturally be much reduced under postwar reorganization, that of the R.C.N., for example, having been tentatively fixed at 10,000.

**Japanese Naval Strength.**—At the close of hostilities Japan could dispose of only one seaworthy battleship, and that in somewhat damaged condition. Three others remained in port in a wrecked state. There were 4 disabled aircraft carriers, 4 cruisers (only one of which was undamaged), 38 destroyers (many of them damaged), 51 submarines, 5 coast defense and training ships and 93 small coastal craft. Ships totally lost comprised 8 battleships, 19 aircraft carriers, 35 cruisers and a coast defense ship, besides large numbers of destroyers, submarines and vessels of less importance.

**France.**—At the conclusion of the war the French navy was left with 3 battleships (one of them under refit); 1 escort carrier; 9 cruisers; 28 destroyers and large torpedo boats; 28 submarines; 5 sloops; 6 frigates; 9 corvettes; and 12 fleet minesweepers. Total losses during the war amounted to 6 battleships; 10 cruisers; at least 35 destroyers and large torpedo boats; 44 or more submarines; 3 sloops; 3 corvettes; 5 fleet

Navies of the World as of December 1945

Country	Battleships and battle cruisers	Fleet aircraft carriers	Escort aircraft carriers	Cruisers	Destroyers and large torpedo boats	Submarines

\*Figures relating to the Japanese, German, Italian and Siamese navies must be taken as approximate. Ships formerly belonging to these countries would possibly be divided among the United Nations except in the case of submarines, which were likely to be scrapped. Precise information concerning the soviet and Yugoslav navies was not available, but the above details are believed to be accurate.

minesweepers; and more than 100 other vessels, including patrol craft, coastal craft, trawlers, oilers and miscellaneous auxiliaries. A cruiser, 7 submarines and 4 fleet minesweepers were under construction.

**Germany.**—Ships remaining, which it was understood were to be divided between the victorious Allies, comprised 6 cruisers, most of them more or less damaged, more than 20 destroyers and about 150 submarines, besides a great many minesweepers and other small craft.

**Italy.**—There were left in Italian hands at the end of the war 5 battleships; 9 cruisers; 36 destroyers and large torpedo boats; 35 submarines; 25 corvettes; and a considerable number of other vessels. Disposal of these ships would be covered by the treaty of peace between the United Nations and Italy.

**U.S.S.R.**—Information concerning the soviet navy was very scanty, owing to the strict secrecy maintained on the subject; but it is believed that at the end of 1945 the fleet included 4 battleships, 8 cruisers, more than 50 destroyers and fully 100 submarines, with considerable flotillas of coastal craft, patrol vessels, minesweepers, etc.

**Other European Countries.**—In the Netherlands fleet were included 2 cruisers, 5 destroyers, 12 submarines, 3 sloops, 1 frigate and 4 fleet minesweepers. It was hoped in addition to acquire a cruiser and an escort carrier from the British navy.

In the Norwegian navy there were 7 destroyers and large torpedo boats, 3 submarines, 4 corvettes, 3 minelayers, 2 old coast defense ships and a number of smaller craft. A new destroyer was nearing completion.

Denmark had remaining out of the fleet it possessed before being attacked by Germany 2 frigates, 2 corvettes, 7 torpedo boats and an assortment of smaller craft, many of them badly damaged. Two destroyers were under construction.

Sweden had 2 cruisers, 7 coast defense ships, 27 destroyers and large torpedo boats, 26 submarines, 2 minelayers and numerous minesweepers and patrol craft. Two cruisers and two destroyers were nearing completion.

Finland possessed 1 coast defense ship, 5 submarines and a number of small craft such as minesweepers and launches.

Poland had under Allied operational control 1 cruiser, 6 destroyers and 3 submarines, besides some smaller craft. Disposal of 3 submarines in Swedish waters was under discussion late in 1945.

Spain had 6 cruisers, 16 destroyers, 8 submarines, 6 minelayers and 3 sloops. Under construction or completing were 20 destroyers, 8 sloops and 7 fleet minesweepers.

Above: FIREFIGHTERS aboard the oldest and largest navy aircraft carrier, U.S.S. "Saratoga," work to stem the damage of seven direct hits from Japanese bombers during operations off Iwo Jima on Feb. 21, 1945. She returned to duty after a record repair job at the Puget Sound navy yard, Wash.

Upper right: U.S. AIRCRAFT CARRIER "Franklin," listing badly, starts home under her own power. Two hits from a Japanese dive bomber on March 19, 1945, touched off explosives and fuel, turning the carrier into a furnace. Casualties exceeded 1,000

Right: NAVY LANDING CRAFT, supported by battleships, cruisers and destroyers, deliver supplies to the beaches of western Okinawa in April 1945

Below: PART of the surrendered Japanese fleet, photographed at anchor in Kure Bay, south of Hiroshima, in Sept. 1945

Lower right: TAKING OFF from a coast guard-manned LST, a Duck carries marines of the 5th amphibious corps to the southeastern shore of Iwo Jima during the invasion of Feb. 1945

Portugal possessed 5 destroyers, 3 submarines and 6 sloops, with sundry ancillary vessels. Turkey had 1 old battle cruiser, 6 destroyers, 9 submarines and 5 minelayers, besides 2 old cruisers used for training and some other ships of less importance. In the Hellenic navy were 1 old cruiser, 13 destroyers, 5 submarines, 4 corvettes and some smaller vessels.

Rumania had, so far as could be ascertained, 3 destroyers, 3 submarines, 1 minelayer and some minor war vessels. Bulgaria had only a few small craft. In the Yugoslav fleet there were believed still to be one destroyer, a submarine or two and a corvette.

**South and Central America.**—In the Argentine navy at the end of 1945 were 2 old battleships, 3 cruisers, 11 destroyers, 3 submarines, 4 coast defense ships and 14 minesweepers. Two small sloops were under construction.

Brazil had 2 old battleships, 1 old cruiser, 12 destroyers, 4 submarines, 6 corvettes and some smaller craft. Six destroyers were being completed at Rio.

Chile had 1 battleship, 2 cruisers, 8 destroyers, 9 submarines, 2 coast defense ships and a sloop.

Other South and Central American states possessed navies of relatively small importance. Peru had 2 cruisers, 2 destroyers and 4 submarines; Colombia, 2 destroyers; Mexico, 5 sloops; Cuba, 2 sloops; Uruguay, a sloop; Venezuela, Ecuador, Paraguay, Haiti, the Dominican Republic, Costa Rica and Nicaragua, a few small craft each.

**Asia.**—China appeared to have emerged from eight years of war with 2 small cruisers and a number of river gunboats at its disposal; but negotiations were reported to be on foot for the acquisition of other ships from the British and United States navies.

The Siamese navy included 4 coast defense ships, 1 destroyer, 3 submarines, 2 sloops and some smaller craft, the disposal of which had still to be settled. Two cruisers which were under construction in Italy were still unfinished. An old destroyer and some river craft owned by Manchuria would presumably be taken over by the Allies. Iran and Iraq each possessed a few small craft of insignificant fighting value. (See also MUNITIONS OF WAR.)

**Navy, U.S. Department of:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

## Nazimova, Alla

(1879-1945), U.S. actress, was born June 4 in Yalta, the Crimea. She attended school in Switzerland and then studied violin at the Philharmonic Music academy in Odessa, U.S.S.R. At 17 she gave up the violin, studied acting at the Philharmonic Dramatic school (which later became the Moscow Art theatre) and toured the continent with a stock company. She went to New York in 1905, where she performed the leading role in the Russian language version of *The Chosen People* at a small theatre on the east side. Mme. Nazimova's fiery temperament and exuberant vitality were soon discovered by the dramatic critics, and within a few months she was signed up for Broadway productions. She easily fulfilled the contract provision that she learn English within six months, and was an immediate success in her debut as Hedda in Ibsen's *Hedda Gabler* in 1906. Thereafter, her rise was meteoric and she became an outstanding interpreter of roles in plays of Ibsen, Chekhov, Tolstoy, Dostoevski and Eugene O'Neill. Mme. Nazimova became a U.S. citizen in 1927. She duplicated her stage success in the silent motion pictures, but the tendency of the Hollywood producers to cast her in "vampire" roles led her to forsake the screen in 1928 and to return to the New York stage. She played various roles with Eva Le Gallienne's Civic Repertory theatre and later with the

Theatre Guild. She returned to motion pictures for several roles and appeared in a feature part in *The Good Earth*. She died in Hollywood, Calif., on July 13.

**Nazis:** see ANTI-SEMITISM; GERMANY.

**N.E.A.:** see NATIONAL EDUCATION ASSOCIATION.

## Nebraska.

One of the states formed from the territory of the Louisiana Purchase, Nebraska lies in the lower Missouri valley in the west north central part of the United States; admitted to the union in 1867; land area, 76,653 sq.mi.; water area, 584 sq.mi.; pop. (1940) 1,315,834; capital, Lincoln (81,984). In 1940, 39.1% of the population was urban. About 1% of the total population is Negro and about 8% foreign-born, principally German and Scandinavian. On July 1, 1944, the bureau of the census estimated the civilian population at 1,213,792.

**History.**—Dwight Griswold, Republican, was re-elected governor Nov. 7, 1944, for the term 1945-47. Other state officers in 1945 were: lieutenant governor, Roy W. Johnson; auditor, Ray C. Johnson; secretary of state, Frank Marsh; treasurer, Edward Gillette; state superintendent of public instruction, Wayne O. Reed; chief justice, Robert G. Simmons. Alone among the 48 states, Nebraska has a one-house legislature, the 43 members of which are chosen biennially on a nonpartisan ballot.

The legislature of 1945 enacted laws providing for more liberal unemployment benefits, introducing retirement systems for municipal and school employees, adjusting county salaries, and setting up machinery for the comprehensive regulation of aviation. The legislative council was authorized to initiate or continue extensive investigations of electric power, irrigation and water utilization, public school organization and finance, municipal financial practices, and the legal status of life insurance companies.

**Education.**—Elementary and secondary education is largely under the control of local school districts, of which there were about 7,000 in 1945, with some supervision by the state superintendent. More than 1,400 rural school districts were not operating schools, though legally in existence. The total enrolment in elementary and secondary schools in 1944 was 237,589, and the teaching staff numbered 12,252. Expenditures for 1943-44 amounted to \$23,845,259.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The state appropriation for public assistance for 1945-47 was \$20,187,000. In July 1945 the number of persons receiving general relief was 1,964, and the amount spent for the year ending June 30, 1945, was \$613,210. At the same time, recipients of aid to dependent children numbered 5,089 and received during 1944-45 \$949,843; 442 blind persons received \$152,031. The state maintained six correctional institutions with a total of 983 inmates on July 1, 1945, and ten others for dependents, with a population of 6,608; 3,499 inmates were on parole at the same date. These 16 institutions were under the supervision of an appointed board of control to which was appropriated \$4,969,000 for 1945-47.

**Communications.**—The total highway mileage of the state in 1945 was 101,042. Of this, 9,167 mi. had been designated as part of the state system of highways and were maintained by the state. Of this latter figure, 4,015 mi. were hard surfaced, 4,904 gravelled, and 258 earth. State expenditures for highway purposes during 1943-45 amounted to \$13,925,387 while the budget for 1945-47 carried \$9,748,000 including estimated federal funds of about \$1,500,000. In 1945 there were 68 airports in the state, 32 of which were managed by municipalities, in addition to 5 civil airways intermediate fields and an undisclosed number of federally maintained auxiliary landing fields. Total railway mileage in the state in 1945 was 6,478. Fifteen radio stations operated within the state in Nov. 1945, seven of which were located in Omaha and Lincoln.

**Banking and Finance.**—State banks numbered 279 in 1945, an increase of one over 1944. Total assets were \$278,379,583. There were also 46 building and loan associations with assets of \$65,203,121, and 144

co-operative credit associations and credit unions with assets of \$8,611,067. National banks at the same date numbered 130 with resources of \$877,781,000.

The total assessed value of the state in 1945 was \$2,149,553,886. The tax rate for state purposes was set at 2.84 mills, calculated to produce \$6,104,732. Receipts for the biennium 1943-45 amounted to \$68,325,114, including \$17,358,085 of federal funds. Expenditures were \$61,041,635. Total appropriations for 1945-47 were \$57,926,458, including estimated federal funds of \$14,603,000. There was no state tax on personal or corporate incomes or on sales except of gasoline. The state had no bonded debt, though that of local subdivisions in 1944 amounted to \$57,198,416. This figure did not include the indebtedness of public power districts which in 1944 amounted to \$88,000,000.

Leading Agricultural Products of Nebraska, 1945 and 1944

Crop	1945	1944
Corn, bu. . . . .	261,019,000	329,855,000
Wheat, bu. . . . .	86,366,000	35,944,000
Oats, bu. . . . .	74,522,000	35,586,000
Barley, bu. . . . .	13,179,000	8,928,000
Potatoes, bu. . . . .	11,520,000	8,400,000
Sugar beets, tons . . . . .	708,000	490,000
Alfalfa hay, tons . . . . .	1,767,000	1,674,000

\*Estimated Nov. 1, 1945.

**Agriculture.**—The total acreage harvested for the crops listed in the table above in 1945 was 16,141,000. In addition, the estimated production of wild hay for 1945 was 2,774,000 tons. The total farm income for 1944 was \$644,833,000, divided as follows: crops \$145,393,000; livestock \$477,893,000; government payments \$21,547,000. Agricultural income for 1945 was estimated Nov. 1 at \$700,000,000, including government payments.

**Manufacturing.**—Manufacturing is of comparatively minor importance in the economy of Nebraska. Most manufacturing establishments are engaged in the processing of farm products. No comprehensive figures of production were available after the federal census of manufactures in 1939. At that date 1,161 establishments employed 22,452 persons and paid salaries and wages amounting to \$28,135,500. There was a considerable increase in manufacturing activity during World War II but no figures were available in 1945.

**Mineral Production.**—Aside from clay, sand and gravel which for the most part are locally consumed, the state has no mineral wealth of consequence. Petroleum was discovered late in 1939 and there were in 1945 72 active wells. Total production to Nov. 1 was about 5,000,000 bbl., an insignificant part of the national output. (L. W. L.)

**Necrology:** see OBITUARIES.

**Negroes (American).** The Negro and World War II.—The end of World War II found the Negro furnishing a close approximation to his population quota in the U.S. army, 8.67% (695,264), with more than two-thirds of these (475,950) in overseas service, and with officer strength of 7,768 in all branches; and within a year of the unrestricted use of Negroes in the navy, an enlisted personnel of 165,397 men, 60 WAVES and 50 commissioned officers. The 92nd division in the European theatre and the 93rd division in the Pacific, in spite of morale handicaps over the policy of army segregation, earned over-all creditable service and combat records, with numerous instances of unit and individual citations. In the last stages of the European campaign, especially in the 1st and 7th armies, combat integration of white and Negro troops was successfully tried, involving 2,600 Negro volunteers for dangerous engagements of the battle of the Bulge, the siege of Bastogne, where a Negro, Capt. Charles I. Thomas of Detroit, Mich., received the distinguished service cross medal and the 614th tank destroyer battalion a special unit citation, and in the rapid advances of these armies across the Rhine as far as Nuernberg. Thirty-two Negro units received the amphibious invasion award. The 99th pursuit squadron and the 332nd fighter squadron, with a record of 261 enemy planes, received unit citations, many individual awards, with seven distinguished flying crosses, while the 92nd division sustained 5,752 casualties and received a total of 12,096 awards. The consensus of official opinion about the Negro's war efficiency was favourable, and Negro army re-enlistments, at 18%, far exceeded both army and population quotas. Col. B. J. Davis, Jr., after successful command of the Negro air force units in Italy, was returned, with a merit award, to command the new 477th composite group at Godman field, Ky.

**Legal and Political.**—In civil rights decisions, a Florida

court outlawed the restricted white primary, Judge Hoyt Davis in Macon, Ga., ruled that Negroes were entitled to vote in the Democratic "white" primaries, and in Los Angeles Co., Calif., superior court, Judge Thurman Clark ruled that restrictive residence covenants were unconstitutional. The New York State Commission Against Discrimination started functioning July 1, with a Negro member, Elmer C. Carter, and moves for state Fair Employment Practices commission bodies spread, along with increased agitation for a federal F.E.P.C. As a result of congressional fund curtailments, however, ten district offices of the national F.E.P.C. were forced to close. The city of Chicago, Ill., became the first municipality to pass an antidiscrimination ordinance for city employment and city contracts. Irving Molli-son, a Chicago attorney, was appointed judge of the federal customs court of New York; Charles W. Anderson became the first Negro to be elected to the state legislature in Kentucky. Ralph Bunche, a former official of the Office of Strategic Services, was appointed a member of the Anglo-American Caribbean commission and became, also, assistant director of the division of dependent areas of the U.S. state department. Benjamin Davis was re-elected to the New York city council with the largest Manhattan vote; Rev. David W. Harris was elected Episcopal Bishop of Liberia, and Horace Mann Bond the first Negro president of Lincoln university, Pa.

On the industrial front, where F.E.P.C. legislation was enacted, there was immediate improvement in the upgraded inclusion of Negroes in large concerns, like the Metropolitan Insurance Co., N.Y., office, the Edison and Bell Telephone and other utilities, as well as in state and municipal civil service. Industrial leaders, however, expressed deep concern over the Negro's economic chances in reconversion cutbacks, especially in view of seniority rights. Union organization of Negroes increased rapidly, especially in C.I.O. organizations.

**Educational and Cultural.**—The *Crisis* survey reported 4,829 Negro college graduates for 1945, an increase of more than 200 in spite of war, with 423 of these degrees professional, 244 of master's rank and 16 doctoral. There was heavily increased registration in both Negro and mixed colleges, and a marked increase in the appointment of Negro teachers on mixed college faculties, both in permanent and visiting appointments, including Smith college, Northampton, Mass., Wayne university, Detroit, Mich., Vassar, Poughkeepsie, N.Y., Olivet, Olivet, Mich., University of Wisconsin, Madison, Wis., and others. The Trenton, N.J. city school system abolished separate high schools; although tension broke out over similar segregation in several cities, notably Gary, Ind.

American College of Surgeons opened its membership to Negro physicians, and Dr. Douglass Stubbs was elected to the International College of Surgeons. Booker T. Washington was elected to the National Hall of Fame, and Paul Robeson became the 30th Spingarn medalist. Joe Louis was awarded the army legion of merit for his work for the service relief funds and Negro camp morale tours. Pres. Branch Rickey, of the Brooklyn baseball team, signed Jackie Robinson to the Montreal branch squad, the first Negro in big-league organized baseball. Two successful Broadway productions, with mixed casts, were the drama version of Lillian Smith's *Strange Fruit*, and a problem play of Southern discrimination against returning war veterans, *Deep Are the Roots*, by James Gow and Arnaud D'Usseau. The St. Emma Industrial school (Va.), a Catholic institution, received a \$1,000,000 bequest. Gwendolyn Brooks, a young Negro poet, received critical acclaim for her first book of verse, *A Street in Bronzeville*. (See also LYNCHING.)

**Nepal.** An independent kingdom (area c. 54,000 sq.mi., est. pop. 5,600,000) lying between India and Tibet—and including Mt. Everest—ruled in fact by the prime minister, Maharaja Sir Joodha Shum Shere Jung Bahadur Rana. Capital: Kathmandu (pop. c. 108,800).

Tens of thousands of Gurkhas who had fought magnificently through the Burma campaign returned to Nepal in the autumn of 1945. Their contribution to victory was acknowledged by Field Marshal Viscount Wavell, viceroy of India, in his reply to the victory greetings of the maharaja of Nepal. "The friendship of Nepal," he said, "and the courage of the Nepal warriors has contributed considerably to this glorious victory." The regular Gurkha regiments had been doubled, trebled and quadrupled during the war and Gurkhas had formed the great bulk of the Assam rifles, the Assam regiment and the Burma rifles.

Maharaja Sir Joodha Shum Shere Jung Bahadur Rana, prime minister and supreme commander-in-chief, retired on Nov. 29 after a 13-years' tenure of office. He was succeeded by his nephew, General Sir Padma Shum Shere Jung Bahadur Rana.

Various reforms introduced during the office of the retiring premier had included improvements in civil and military administration, the judicial system, education, communications and trade. The country's electricity supply was extended by the opening in 1933 of a second hydro-electric plant, and financial progress was marked by the establishment of the Bank of Nepal at Kathmandu in 1937 and later by the first circulation of Nepalese currency notes. (J. R.A.)

**Nervous System.** Investigations and studies of the nervous system in 1945 were continued along the line of previous research. There were no new discoveries. Penicillin continued to be the drug of extreme usefulness in infectious diseases of the central nervous system. In certain types of syphilitic disease of the brain and spinal cord penicillin was found to be helpful.

**Muscles and Nerves.**—L. J. Pollock and his associates described the results of experimental work obtained from the examination of muscles whose nerves were cut (deafferented). Their results showed that this new method of electrical examination of muscles indicated potential recovery of the involved muscle long before the patient was able to move the paralyzed muscle or muscles or even feel pin prick or touch sensation. This work was of tremendous value and carried important implications to the neurologist because it permitted accurate determination of the ultimate outcome in cases of muscle and nerve injuries.

**Graduate Medical Instruction.**—Practically all medical schools made intensive plans for graduate medical instruction for the medical officer who went into the armed services before he had received a full internship, residency or postgraduate studies. The schools also planned for short refresher courses for the older medical officers. Finally arrangements were made for those returning medical officers who desired sufficient graduate education so that they could become neurological specialists and be certified as such by the American Board of Neurology. In a study made by Northwestern University Medical school 90% of 400 responses indicated their intention of obtaining graduate training immediately after World War II. Many of these desired graduate education, while some wanted postgraduate or short refresher courses of six months or less. Northwestern University Medical school planned to accept students for graduate education while another school, already organized for that purpose, agreed to

give short refresher courses in postgraduate education in neurology.

**Netherlands.** A kingdom of northwest Europe, bounded N. and W. by the North sea, E. by Germany and S. by Belgium. Occupied by German armed forces in May 1940 and liberated in May 1945. National flag, red, white and blue, in equal horizontal stripes. Area 12,742 sq.mi.; pop. (est. Dec. 31, 1942) 9,076,250. Chief towns (pop. est. Dec. 31, 1942): Amsterdam (cap., 790,900); Rotterdam (616,910); The Hague (prewar seat of the government, 507,351). Language: Dutch; religion: Christian (1930 census, Dutch Reformed church 2,732,333; Roman Catholic 2,890,022). Ruler: Queen Wilhelmina; prime minister (1945): W. Schermerhorn.

**History.**—The famine which had threatened the western provinces of the Netherlands at the end of 1944 increased in intensity up to the moment of liberation in 1945. During the final few weeks, the population of the western provinces, about 4,000,000 people, were subsisting on between 300 and 400 calories per day, consisting mostly of sugar beets and tulip bulbs. On April 29 the delivery of food to the big towns by air began. Bread had already been sent by ship from Sweden. On April 18 the 50,000 ac. of the Wieringermeer polder were flooded, involving the loss of fertile farm land and about 500 farms. The German army in the Netherlands capitulated on May 5, and on May 23 the Dutch cabinet met once more in The Hague. This was a *démis-sionnaire* cabinet, as, in accordance with declared policy, it had tendered its resignation to Queen Wilhelmina immediately after the total liberation of the country. The Queen charged W. Schermerhorn, leader of the Netherlands Peoples movement, and W. Drees, leader of the Dutch Social Democrats, with the formation of a new cabinet, the composition of which was announced on June 23. Schermerhorn became prime minister, Drees took the portfolio of social affairs, and Dr. E. N. van Kleffens continued as minister for foreign affairs. With the exception of J. M. de Booy, minister for shipping, the other ministers were drawn from men who had remained in the country during the occupation. On July 20 a national advisory council was set up to tide over the period before a parliament could be elected.

Immediately after the liberation, arrangements were made for the establishment of a fighting force of 200,000 men, to take part in the liberation of the Netherlands Indies and the occupation of Germany. On the capitulation of Japan contact was established with the governor of the Netherlands Indies, Jhr. Tjarda van Starkenborgh Stachouwer, who had been imprisoned in Mukden. (G. J. R.)

**Education.**—In 1938: elementary schools 7,812, scholars 1,242,778; secondary schools 288, scholars 62,301; high schools (1937-38) 4, scholars 3,037; universities (1937-38) 6, scholars 9,471.

**Finance.**—Revenue, ordinary (est. 1940), \$394,000,000; expenditure, ordinary (est. 1940), \$393,800,000; public debt (March 1944), \$5,680,000,000; notes in circulation (Aug. 28, 1944), \$2,377,000,000; gold reserve (Sept. 1944) \$496,000,000; exchange rate (average 1944), 1 florin=53.19 U.S. cents.

**Trade and Communication.**—Trade (merchandise): imports (1938) \$751,000,000, (1939) \$804,000,000; exports (1938) \$551,000,000, (1939) \$512,000,000. Communications and transport (1938): roads suitable for motor traffic, 8,534 mi.; railways open to traffic, 2,278 mi.; rivers and canals, navigable,

DUTCH CHILDREN, housed at Hoensbroek castle, Holland, in charge of nuns, promenading the grounds in national costume with some of the U.S. soldiers who assisted in their care during 1945

4,817 mi.; airways, distance flown, 6,629,000 mi.; shipping (June 30), 2,855,400 gross tons; launched (July 1938-June 1939), 246,400 gross tons; entered with cargoes, 27,606,524 net tons; cleared with cargoes, 23,151,428 net tons. Motor vehicles licensed (Aug. 1, 1938): cars 94,000; buses 4,088; trucks 50,988; cycles 55,140; wireless (June 30, 1939): registered receiving sets 839,542; connections with radio-distributing systems 368,710.

**Agriculture, Manufactures, Mineral Production.**—In short tons (1939 actual figures): wheat 458,175; rye 663,885; barley 160,645; oats 494,165; pulse 204,480; sugar beets 1,887,657; flax 167,736; cotton goods (1938) \$72,800,000; machinery (1938) \$53,150,000; coal 14,147,000; salt 219,780; pig iron and ferroalloys (1938) 304,260; zinc 22,550. (See also CURAÇAO; NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES; SURINAM.)

**Netherlands Colonial Empire.** Total area excluding mother country (approx.) 789,700 sq.mi.; total pop. excluding Netherlands (est. Dec. 31, 1940) 70,760,000. The accompanying table lists the overseas territories of the Netherlands, together with statistics appropriate to each of them.

**History.**—With the military defeat of the Japanese empire drawing near, the Japanese regime in the Netherlands Indies accelerated its political rearguard action. In March 1945 the Japanese commander in chief in Java established a "committee for preparing independence," and a campaign was launched by Japanese propagandists to raise popular support. On Aug. 11, after the Japanese offer of surrender to the United Nations, a meeting took place at Singapore between the Japanese commander in chief, southern area, Field Marshal Terauchi, and representatives of the "Independence Committee." The latter included R. I. Soekarno and Dr. Mohamad Hatta who, on their return to Java on Aug. 19, proclaimed the "Republic of Indonesia," and took office as president and vice-president respectively.

Meanwhile responsibility for military operations in this area had been transferred from the U.S. Southwest Pacific area command to the British commander in chief in Southeast Asia, Lord Louis Mountbatten. The Netherlands Indies, therefore, were to

be liberated mainly by British forces; the Dutch share in this task was of necessity limited, since the liberated mother country had few trained troops available, while Dutch shipping remained tied up in the United Nations shipping pool. An agreement was concluded between the British and Netherlands governments whereby it was agreed that during the first phase of operations in the Netherlands Indies the supreme Allied commander in Southeast Asia would exercise full authority and bear responsibility for the civil administration. A body of trained Dutch civil servants (Netherlands Indies Civil Affairs, or N.I.C.A.) were to be put at his disposal for the execution of this task.

The sudden collapse of Japan in August found the British commander in chief insufficiently equipped for immediate action in the Netherlands Indies as a result of widely scattered commitments of a similar nature in Burma, Malaya and French Indo-China. For the time being, therefore, the Japanese military authorities were charged with the duty of maintaining law and order and providing facilities for the relief of prisoners of war and European civil internees. These, numbering more than 100,000, had been herded together in prisons and concentration camps for years under appalling conditions. A special organization (Relief, Allied P.O.W. and Internees, or "RAPWI") was commissioned for this task.

This enforced interregnum resulted in considerable confusion, during which the "Republican" regime succeeded in seizing control of large parts of Java, including public services and buildings in the cities. The movement was supported mainly by thousands of young men, who had been inculcated with Japanese propaganda and had received arms from them; it spread by terrorism and by the prestige of initial success, but deteriorated rapidly into anarchy, violence and looting, and seriously hampered the activities of "RAPWI."

On his return to Batavia on Oct. 4, the lieutenant-governor-general of the Netherlands Indies, Dr. H. J. van Mook, initiated discussions with a group of representatives of the Indonesian nationalist movements on the subject of political reforms to be carried out on the basis of Queen Wilhelmina's broadcast of Dec. 6, 1942. Simultaneously, a debate took place in the Dutch parliament at The Hague, which resulted in support at home for the government's proposals for reform. The "Republican" leaders, whose position between the group of constructive Indo-

nesian nationalists and armed extremists had become embarrassing, looked for a way out in the direction of political intervention by the Pacific powers.

By Oct. 31 the situation in Java was officially described as "almost war" and from then until the end of the year it continued to deteriorate. Attempts at negotiation failed because the Dutch said they could not hold political discussions until order was restored, while the Indonesians felt that if once they handed over their arms they would have lost their cause.

From the British point of view the objective was to restore order as quickly as possible and leave the field clear for negotiations between Dutch and Indonesians. Accordingly, at a conference of Allied commanders held at Singapore on Dec. 5, the commander in chief was fully empowered to restore law and order as far as his military resources allowed. The British attitude was made clear at a conference between Dutch and British ministers (including Dr. van Mook) held at Chequers on Dec. 27. The British prime minister announced on Dec. 28 that his government reaffirmed their obligation to the Dutch to establish without delay conditions of security in which it would be possible to continue negotiations. This was an essential contribution toward the completion of the task entrusted to Great Britain by the Allied supreme command. On Dec. 28 the Indonesian "government" stated that it was prepared to co-operate to seek the accomplishment of the task entrusted by the United Nations to the British forces. (See also CURAÇAO; NETHERLANDS INDIES; SURINAM; WORLD WAR II.) (W. G. P.)

**Netherlands Indies.** The Netherlands Indies is a huge archipelago, with several very large islands, Java, Sumatra, Celebes, Borneo, New Guinea (part of Borneo is British and the eastern half of New Guinea is under Australian administration) and many smaller ones. The archipelago lies between 6° N. and 10° S. lat., and the climate is tropical. Area, 735,000 sq.mi.; pop. (census of 1930) 60,727,233; (est. 1940) 70,476,000, of whom 48,416,000 lived in densely settled Java and the adjacent small island of Madura, while 22,060,000 lived in the so-called Outer Islands, which are more sparsely settled and less developed economically. Capital, Batavia, pop. 1930 (435,184). Other large cities, Surabaya (341,675); Bandung (166,815). The great majority of the natives are Moslems, although an admixture of pagan and Hindu practices is found in some regions. There are about 2,500,000 Christians, and a number of Animists. Governor-General (appointed 1945), Dr. Hubertus van Mook.

**History.**—Japan overran the Netherlands Indies in the spring of 1942 and remained in military occupation of the archipelago (except for outlying points in New Guinea and Borneo which were recovered by the United Nations forces) until the Japanese empire accepted the terms of unconditional surrender in Aug. 1945.

The "cease fire" order to Japanese forces in Java was issued on Aug. 19. "It is understood," the official announcement stated, "that in view of this development the military administration in Java has decided that it will henceforth dissociate itself entirely from the movement for the independence of Indonesia. Imperial Japanese forces stationed in Java will undertake, for as long a time as is deemed necessary, to maintain peace and order."

There was a long interval between the Japanese surrender and the arrival of British forces of occupation, which landed in

the port of Batavia on Sept. 29. Because of the lack of shipping and the absence of available forces, Dutch troops played a minor part in this occupying force, which was largely composed of British Indian troops under the command of Lieut. Gen. Sir Philip Christison.

Meanwhile a self-styled Indonesian republic, headed by Achmed Soekarno, had been set up and laid claim to administrative authority. Soekarno was an Indonesian nationalist who had opposed Dutch rule in the past and had co-operated with the nominally self-governing native administration set up by the Japanese. The Dutch authorities refused to negotiate with him. Later another nationalist with a vaguely socialist program, Sutan Sjahrir, took over the leadership in the nationalist movement.

At first General Christison indicated unwillingness to interfere in the local administrative situation. He proposed to restrict the occupation to a few of the larger towns in Java and Sumatra and to concentrate on the rescue of some 200,000 Dutch and Eurasians who had been placed in internment camps by the Japanese. However, clashes between the forces of occupation and Indonesian armed units broke out and there was heavy fighting in Surabaya in the last days of October. This was finally stopped by mutual agreement between the British authorities and Soekarno.

The situation remained troubled and confused until the end of 1945, with sporadic outbursts of violence and a failure to reach an agreement between the Dutch authorities and the Indonesian nationalists. Governor-General van Mook declined a suggestion that the conflict be referred to the United Nations and expressed preference for direct Dutch-Indonesian discussions. General Christison issued a statement toward the end of December stating that British troops were in the Indies only for the purpose of disarming and repatriating Japanese troops and rescuing European and Eurasian war prisoners and internees. The statement referred to "most horrible outrages," committed by terrorists and extremist organizations and concluded:

I am compelled to take more active measures to insure law and order, to enable peaceful inhabitants once more to go about their business without fear and intimidation in the areas for which I am responsible.

The U.S. state department in December put out a statement suggesting negotiations between the Dutch and Indonesian leaders "in harmony with the principles and ideals of the U.N.O. charter."

**Government.**—A representative assembly with limited powers, the Volksraad, existed in the Netherlands Indies before the Japanese occupation. It was composed of 60 members, 30 natives, 25 Europeans and 5 foreign orientals, usually Chinese. More than half were selected by a system of indirect ballot; others were appointed by the governor-general. A system of indirect rule through native sultans was practised in some parts of the archipelago. The Japanese tried to stir up Indonesian feeling against everything Dutch and sometimes changed Dutch place names to Indonesian. They also encouraged the formation of local administrative councils, although Japanese military authority was supreme until the surrender.

**Education.**—In Aug. 1943 there were 12,000 elementary schools in the Netherlands Indies, with 1,900,000 pupils, besides 32 secondary schools, 5 high schools, 20 vocational schools,

"WELCOME HOME." Return of Dutch colonial rule in Java was marked in 1945 by a flare-up of Indonesian nationalists who demanded independence. Cartoon was by Jensen of the *Chicago Daily News*

1 agricultural college, 7 fine arts schools for girls, 1 normal college, 1 medical college and 1 technical college, according to the Japanese Domei news agency. According to Dutch sources, there were more than 20,000 native schools, with more than 2,500,000 pupils, under the Netherlands administration, besides 628 western style schools, with 150,000 students; 7.2% of the population was literate in 1930.

**Finance.**—The Japanese yen was introduced into the Netherlands Indies as the unit of currency after the conquest of the archipelago. It was given parity with the former unit, the Dutch guilder; formerly the ratio was one yen for .44 guilders. Various Japanese banks established branches in the Netherlands Indies and a Southern Regions Development bank was set up to finance the production of raw materials. Dutch currency would presumably be restored in the Indies as soon as political and economic conditions became more stable. The last Dutch budget, in 1942, anticipated revenue of 750,918,773 guilders and expenditures of 813,802,815 guilders.

**Trade and Communication.**—Imports in 1940 were 444,300,000 guilders (value of the guilder 53 U.S. cents); exports were 873,500,000 guilders. Principal exports in 1940 were rubber (328,254,000 guilders); oil and petroleum products (169,577,000 guilders); tin and tin ore (72,218,000 guilders); sugar (52,041,000 guilders); tea (50,925,000 guilders). It was announced on Nov. 2, 1945, that the first shipment of tin after the Japanese capitulation had been sold in Singapore.

In 1940, there were 43,450 mi. of highways and 4,620 mi. of railways, 3,387 in Java and 1,233 in Sumatra. There were 94,000 motor vehicles of all types in 1941; 10,870 steamers, with a total tonnage of 12,456,664, cleared from the ports of the archipelago in 1939. The Royal Netherlands Airways was formerly one of the three principal lines of air communication between Europe and the orient.

**Agriculture.**—Figures of production, for some of the principal crops in 1940 were as follows: sugar 1,587,364 tons; rubber

546,021 tons; palm oil 241,702 tons; tea 81,986 tons; coffee 77,647 tons; tobacco 27,414 tons; quinine 16,371 tons; cocoa 1,553 tons. It was believed in 1945 that there was a considerable stock of sugar in the archipelago, as production for the years 1942, 1943 and 1944 was estimated respectively at 1,500,000 tons, 1,000,000 tons and 1,000,000 tons. Local consumption did not exceed 325,000 tons annually and the Japanese were able to export very little sugar. The sugar mills, however, were neglected. Only one out of 80 remained in continuous operation. Some of the others were converted to the manufacture of alcohol, ammunition and vitamins for the Japanese. Tea was also neglected by the Japanese. Resumption of production of rubber and tea on the prewar scale was hampered because of the unsettled political conditions in the archipelago.

**Manufactures and Minerals.**—Output of principal mineral products in 1939 was as follows: oil 62,087,000 bbl.; tin 31,000 tons; coal 1,963,200 short tons; gold 81,183 oz.; silver 618,023 oz. (See also JAPAN; NETHERLANDS COLONIAL EMPIRE.)

(W. H. CH.)

**Neutrality:** see INTERNATIONAL LAW.

**Neutrons:** see ATOMIC BOMB; CHEMISTRY.

**Nevada.** One of the mountain group in western United States, Nevada, popularly called the "Battle born" state, entered the union as the 36th state, on Oct. 31, 1864. Area 110,540 sq.mi. with 738 sq.mi. of water; it ranks 6th in size. Pop. (1940 census) 110,247, of which 66,956 were rural and 43,291 were urban. Native white inhabitants numbered 93,431, and foreign-born white 10,599. There were 664 Negroes and 5,553 were of other races. Capital, Carson City (2,478). Reno (21,317), Las Vegas (8,422), Sparks (5,318), Ely (4,140) and Elko (4,094) are the chief cities. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 156,445.

**History.**—The 1945 session of the Nevada legislature passed many important laws; outstanding was the legislation imposing a gross business tax of 1% on gambling. This levy created widespread interest throughout Nevada and resulted in collections, during the period July 1, 1945, to Dec. 31, 1945, of \$98,066.55. Many bills were approved increasing the salaries of elective, appointive and general employees of the state; the salary raises averaged 15%. Legislation completely reorganizing the governing board of the state hospital for mental diseases was passed and resulted in improved conditions at the hospital.

Many outstanding changes occurred in the political setup. First in order of importance was the death of U.S. Senator James G. Scrugham, on June 23, 1945; this was followed by the resignation of Governor E. P. Carville on July 24, Lieutenant Governor Vail Pittman being elevated to the position of governor. Pittman later appointed E. P. Carville as junior U.S. senator. Other appointments were: Gilbert C. Ross to succeed Albert L. McGinty, who resigned as director of the state employment security department; Charles Lee Horsey as supreme court justice to succeed William E. Orr, who was named to the U.S. circuit court of appeals; Roger Foley to succeed federal judge Frank H. Norcross, who retired.

On Jan. 1, 1946, state officers were: governor, Vail Pittman; lieutenant governor, vacant; secretary of state, Malcolm McEachin; state controller, Henry C. Schmidt; superintendent of public instruction, Miss Mildred Bray; chief justice of the supreme court, E. J. L. Taber.

**Education.**—On Jan. 1, 1946, Nevada had 190 elementary schools with a total enrolment of 17,604; teachers numbered 602. High schools totalled 36, with an enrolment of 5,510 pupils, staffed by 237 teachers. The total school enrolment was 23,114.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The amount spent for social security and old age assistance was \$951,244.84 for the fiscal year ending June 30, 1945. Aid to the blind expense

was \$6,260, and \$1,945,004.33 was spent for unemployment compensation benefits. On Jan. 1, 1946, the state prison had 220 inmates including 4 women; total expenditures for the fiscal year ending June 30, 1945, were \$120,936.64. The state industrial home had 24 boys and 6 girls on Jan. 1, 1946, and 18 boys on parole; support of the school for the fiscal year was \$23,709.44. The state hospital for mental diseases had 393 inmates; expenditures were \$138,495.23. The orphans home had 50 children; expenditures for the fiscal year were \$46,916.77.

**Communications.**—During 1945 no regular construction projects were let on the main state highway system. Two contracts involving an expense of \$391,000, let in 1944, were completed in 1945. Two contracts for special maintenance were let at a cost of \$75,331. Five access roads to sources of raw materials with a length of 90.7 mi. were completed at a cost of \$108,000. Minor routes added to the state highway system by the 1945 legislature made the total state designated highway system mileage 5,641 of which 3,113 were hard surfaced and 2,528 were semi-improved or fair country roads.

Railroad mileage in Nevada, including main line, tracks and sidings, totalled 2,331.45 on Jan. 1, 1946; of this, main line mileage was 1,819.08. On Jan. 1, 1946, there were 12 standard airports and 25 secondary airports in Nevada; no airport construction was undertaken during 1945.

**Banking and Finance.**—On Jan. 1, 1946, there were 24 banks in Nevada, total assets exceeding \$165,000,000. Three state banks with four branches had total deposits of \$16,446,559.46 and resources of \$17,323,439.88. The First National Bank of Nevada had 11 branches and on Dec. 31, 1945, had deposits of \$115,507,482 and resources of \$121,064,051. In addition the following national banks operated in the state: the Security National at Reno; the First National of Ely; the First National of Lovelock; and the Ely National bank with a branch at McGill. State receipts for the fiscal year ending June 30, 1945, were \$11,263,192.27; expenditures were \$6,844,145.45; cash balance was \$3,834,255.52. There was no state gross or net debt on Jan. 1, 1946. Total securities held by the state treasury on June 30, 1945, were \$19,071,064.00. Nevada's Postwar Reserve fund totalled \$1,700,000, all in U.S. bonds.

**Agriculture.**—Farm and ranch acreage increased materially in Nevada during 1940-45 according to preliminary figures from the 1945 census of agriculture. The number of farms, however, decreased from 3,573 in 1940 to 3,480 in 1945. Acreage totals were 3,785,106 in 1940 and 4,485,263 in 1945, this increase being in line with the national average shown by the 1945 census.

An increase in the number of cattle and lambs on feed was noted in Nevada during 1945 according to the western regional office of the U.S. bureau of agriculture. Heavy precipitation during the summer of 1945 stimulated excellent forage growth on the ranges and the reserve supply of hay and home-grown feed was adequate to meet all winter needs. Cattle in Nevada, in very good condition, were slightly better than the 20-year average. Sheep were on a par with the 20-year condition average.

Table I.—Leading Agricultural Products of Nevada, 1945 and 1944

Crop	1945 (est.)	1944
Barley, bu. . . . .	640,000	781,000
Potatoes, bu. . . . .	780,000	587,000
Hay, tons . . . . .	599,000	611,000
Oats, bu. . . . .	273,000	284,000
Wheat, bu. . . . .	388,000	440,000
Corn, bu. . . . .	64,000	64,000

**Mineral Production.**—In 1945 minerals marked time with the transition from war to peace. The production of gold, silver, lead, copper and zinc was 11% less than in 1944, labour shortages accounting for the decreases

Table II.—Principal Mineral Products of Nevada, 1945 and 1944

Mineral	Value, 1945	Value, 1944
Gold. . . . .	\$ 3,552,500	\$ 4,166,960
Silver . . . . .	704,569	895,741
Lead. . . . .	1,126,600	1,056,800
Copper. . . . .	14,273,200	16,532,640
Zinc . . . . .	4,669,000	4,719,372

in copper and zinc; lead alone showing an increase. The production of lead, according to the preliminary annual figures was the highest from 1941. Total figures for mineral production in 1945 were given by the bureau as \$24,325,869; the total for 1944 was \$27,371,513.

(E. C. D. M.)

VAIL PITTMAN, Democrat, succeeded to the governorship of Nevada on July 31, 1945, when E. P. Carville resigned to accept an appointment to the U.S. senate

## New Brunswick.

New Brunswick is one of the three maritime provinces of Canada. It entered the union in 1867. The area is 27,985 sq.mi.; the population, 457,401 (1941 census), of which 68.64% is rural. The largest cities are St. John (51,741) and Moncton (22,763). The capital is Fredericton (10,062). Local administration is in the hands of a provincial parliament composed of a lieutenant governor, an executive council and a legislative assembly of 48 members. New Brunswick is represented at Ottawa by ten members of the house of commons, and ten senators.

**History.**—Throughout 1945, the liberal administration of J. B. McNair continued in office. At the dominion general elections of June 11, the following members were returned to the Ottawa parliament, Liberals, 7; Progressive Conservatives, 3.

**Education.**—For the school session 1941-42 enrolment in all educational institutions was 102,119; the revenues of provincially-controlled schools in 1943 were \$3,411,215. The University of New Brunswick, with its seat at Fredericton, is the provincial university. In addition, there are Mount Allison university at Sackville, St. Joseph's university at St. Joseph, and l'Université du Collège du Sacré Coeur at Bathurst.

**Agriculture and Industry.**—In 1944 the estimated gross value of agricultural production was \$61,508,000; farm income, \$32,200,000. In 1945 the value of field crops was \$34,138,000 (1944, \$37,978,000). In 1944 the value of the fisheries was \$5,389,000. For the first six months of 1945, the electrical output of the central New Brunswick electrical stations was 288,253,000 kw.hr.

FILMS.—*Maritime Provinces* (Encyclopædia Britannica Films Inc.). (J. I. C.)

**New Caledonia:** see FRENCH COLONIAL EMPIRE.

**Newfoundland and Labrador.** A British colony of North America, with suspended constitution. Area: Newfoundland 43,560 sq.mi.; Labrador 110,000 sq.mi.; total 153,560 sq.mi.; pop. (est. 1943): Newfoundland, 314,852; Labrador 5,170. Chief town and capital: St. John's (pop. est. 1943: 55,000). Governor (1945): Sir Humphrey Walwyn; language: English; religion (1935 census): Roman Catholic, 93,925; Church of England, 92,709; United Church, 76,134; Salvation Army, 18,054.

**History.**—On Jan. 30, 1945, Viscount Cranborne announced on behalf of Great Britain that the revision of the constitution which his government had hoped would take place in 1945 would have to be postponed. He pointed out that the decision of the people of Newfoundland on their constitutional future would depend largely on their economic future; any attempt at assessing the latter would be purely speculative, and it would be unfair to expect them to come to a decision on the constitutional issue in 1945. Meanwhile practical reconstruction was to proceed.

For the fourth consecutive year the budget showed a substantial surplus, and the commissioner of finance announced an increase of pensions payable to veterans of World War II, a reduction of customs duties on machinery and heavy building materials and the removal of war revenue tax from certain imported goods. In London the parliamentary under secretary to the dominions told the house of commons on Feb. 13 that Newfoundland had lent Britain about £3,000,000 free of interest during the war.

In March the commissioner of home affairs gave details of a scheme for the re-establishment of Newfoundland servicemen, which was estimated to cost £1,500,000. This proposal included a monthly maintenance of from £12 to £30 according to size of family, vocational training, assistance of individual enterprise

up to £125 and land settlement assistance up to £1,125; free medical treatment would be given to nonpensioned men and no means test would be applied. On Dec. 11 the British prime minister announced in the house of commons that in 1946 an elected national convention would examine the position of the country and make recommendations on the future form of government, which would be the subject of a national referendum.

(J. RA.)

**Education.**—In 1941: schools 1,182; scholars on rolls 67,184; average attendance 46,103.

**Banking and Finance.**—Revenue (1944-45) (in U.S. dollars) \$30,282,100; expenditure \$23,955,200; public debt (March 31, 1945) \$82,400,800; exchange rate as Canadian dollar = (1944 official parity) 90.91 U.S. cents.

**Trade and Communication.**—Overseas trade 1943-44: imports \$56,807,806, exports \$38,543,066. Communications (1943): total road mileage, 6,000; railways, government 705 mi., private 60 mi.; motor vehicles licensed (1940) 10,588.

**Mineral Production and Fisheries.**—Fish and fishery products (1943) \$4,747,603; codfish \$1,524,590; herring \$914,720; salmon (fresh and frozen) \$278,161; lobster \$238,939; fish oils \$1,481,475. Wood pulp (1943-44) \$177,080; iron \$1,245,066; lead concentrates \$2,238,648.

**New Guinea.** One of the largest islands in the world, with an estimated area of 312,329 sq.mi., stretching from the equator in the N.W. to 12° 5' S. in the S.E. and from 130° 50' E. to 151° 30' E., separated from Australia by the shallow Torres strait and Arafura sea. On its eastern side lies the Bismarck archipelago.

New Guinea is divided between three administrations: (1) Dutch New Guinea, area 151,789 sq.mi.; pop. (est.) 195,460, of whom 237 were Europeans (1940) (*see* NETHERLANDS INDIES). (2) British New Guinea (Territory of Papua), area 90,540 sq.mi.; pop. 338,822 (1940) is under the governor-general of Australia, with a lieutenant governor of its own and a centre of administration at Port Moresby. It comprises roughly the south-eastern corner of the island and is an exporter of rubber and

**SURVIVORS** T-Sgt. K. W. Decker, Cpl. Margaret Hastings and Lt. J. S. McCollom, beside the plane which rescued them 47 days after their plane crash in Hidden Valley, New Guinea, on May 13, 1945

copra, while copper is mined in the vicinity of Port Moresby. (3) Northeastern New Guinea and the adjacent islands of the Bismarck archipelago, including Bougainville and Buka in the northern Solomons, were German colonial possessions before World War I. After Dec. 17, 1920, this area was administered by Australia under a mandate from the League of Nations. Area 93,000 sq.mi.; pop. (1940) 668,871 natives, besides an unknown number in the unexplored interior; 6,498 non-natives, including 3,345 British, 2,061 Chinese, 430 Germans, 159 Dutch, 145 Americans, 38 Japanese. Administrator of the mandated territory in 1943 was Brig. Gen. Sir Walter Ramsay McNicoll (appointed Sept. 13, 1934). The headquarters of the administration are normally at Rabaul.

**History.**—In the course of their invasion of the South Pacific the Japanese occupied all the foreign settlements in the mandated territory and established their main advanced base in the South Pacific at Rabaul, where the Germans had formerly developed a good harbour, on New Britain Island. At the high tide of the Japanese advance in this area, in the autumn of 1942, their troops crossed the high Owen Stanley range, which cuts across New Guinea in a northwestern-southeastern direction, and threatened Port Moresby, the last important United Nations base north of Australia. However, U.S. and Australian troops under the command of Gen. Douglas MacArthur checked this advance and, making skilful use of airborne troops, took the offensive in turn, driving the Japanese in 1943 from such bases as Lae, Salamaua and Finschhafen and, toward the end of the year, effecting a double landing on New Britain with the apparent purpose of pressing on toward Rabaul, which was threatened from another direction by landings of U.S. forces under the command of Adm. William F. Halsey on Bougainville, in the northern Solomons. The islands were by-passed by Gen. MacArthur's advance toward the Philippines in 1944. By May 26, 1945, Australian land forces were in control of the entire coastline of British New Guinea and Papua, having sealed the remaining Japanese into the interior. Formal Japanese surrender took place on a British aircraft carrier off Rabaul on Sept. 6. The Japanese naval forces in New Guinea surrendered on Sept. 11.

**Agriculture, Mineral Production, Trade.**—As might be inferred from the small number of foreign residents, economic development had been slight. The total area under cultivation in 1940 was 276,000 ac., although it is estimated that the mandated territory contains about 34,200,000 ac. of land suitable for cultivation. Much the greatest part of the cultivated area was under coconut plantations and copra was the main product and export. The territory produced 73,716 tons of copra, of a value of £A.847,734 in 1938. Secondary crops, the output of which is of minor importance, are cocoa, coffee, rubber, kapok and tobacco. Gold, silver and platinum are mined, the first being the most important mineral product. The foreign trade of the mandated territory was £A.1,610,967 in imports, £A.2,980,360 in exports in 1938.

**Social and Economic Changes.**—Although New Guinea may still be considered one of the most remote parts of the world, the total isolation from foreign contacts in which most of the natives lived in the past began to break down under such varied pressures as the activity of the missions, the increasing area patrolled by government officials and the growing demand for native labour on the plantations. There were ten missions (three Roman Catholic, three Lutheran, two Methodist, one Anglican, one Seventh Day Adventist), with a combined staff of more than 600, in New Guinea in 1938. There were 41,849 natives in indentured service in 1938, 20,855 on plantations, 7,189 on mines, 7,511 in shipping, commerce and industry, 4,477 in domestic service, 1,747 in administration service and 70 in miscel-

laneous occupations. There were also 883 native members of the police force. World War II brought further changes and upheavals to this remote region; and the primitive Melanesian natives were used as bearers and for labour service by both sides. (See also WORLD WAR II.) (W. H. CH.)

## New Hampshire.

One of the New England group of states and one of the 13 original states, popularly known as the "Granite state"; area, 9,304 sq.mi., including 280 sq.mi. of water. Population (1940) was 491,524, of which 57.6% was urban and 42.4% rural. Estimated population, July 1, 1944, excluding armed forces overseas, was 457,231, representing a decrease of 7%. In 1940 there were 490,989 whites, including 422,693 native and 68,296 foreign born. Capital, Concord, with estimated population (1943), of 27,495. Other cities: Manchester 78,436; Nashua 33,914; Berlin 16,480; Dover 16,393; and Portsmouth 20,530, as of 1943. A total of 56,900 persons had entered the armed forces by Sept. 1, 1945, of whom 20,641 had been discharged by Nov. 16, 1945.

**History.**—The general court was in session from Jan. 3 to May 18, 1945. Among measures passed were acts to guarantee re-employment of veterans by towns and other political subdivisions of the state; to provide an aerial survey of the state; to abolish the special poll tax of \$3 enacted in 1943 to provide funds for the payment of veterans' bonuses; to create a retirement system for state employees; to provide temporary additional compensation for state employees and to promote the cause of soil conservation. A joint resolution authorized a referendum, by towns, on the question of United States membership in a general system of international co-operation, with police power to maintain world peace. Of 204 towns voting, 202 went on record as favouring such membership.

State officers in 1945 were governor, Charles M. Dale; secretary of state, Enoch D. Fuller; state treasurer, F. Gordon Kimball; commissary general and adjutant general, Charles F. Bowen; acting attorney general, Harold K. Davison and commissioner of education (appointed by the state board of education), James N. Pringle.

**Education.**—In 1943-44 there were 1,763 public schools, classified as follows: kindergartens 45; mixed schools 239; classified schools 1,310; junior high schools 42; senior high schools 89; opportunity schools 17; evening schools 21. The total number of elementary pupils was 48,424, with 2,065 teachers; the number of high school pupils, 17,622, with 924 teachers. Total payments for public education during year ending June 30, 1944, were \$7,706,051. In 1940 private and parochial elementary schools and secondary schools had an enrolment of 25,007.

Other state educational institutions were the University of New Hampshire, at Durham; Keene Teachers college, at Keene; and Plymouth Teachers college, at Plymouth.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The burden of general relief continued to decline during the year ending June 30, 1945, due to war conditions, with increased opportunities for employment. In June 1945 there were 2,185 cases on general relief, with an expenditure of \$62,877, as compared with 2,654 cases in June 1944, with an expenditure of \$72,731. Expenditures for public assistance under the Social Security act were \$276,873, as compared with \$242,894 for June 1944. The total for June 1945 included \$213,512 for old-age assistance; \$54,233 for aid to dependent children, and \$9,128 for aid to needy blind. In 1944, only 2,324 persons collected unemployment compensation, payments to idle workers totalling \$163,295, the smallest amount paid in any year after unemployment compensation came into effect in 1938.

On Jan. 1, 1941, there were 262 persons in prison and in re-

formatories in New Hampshire. The appropriation for the state prison at Concord for the fiscal year ending June 30, 1946, was \$160,189; and for the Industrial School for Committed Minors at Manchester, \$109,320.

**Communications.**—Rural highways and urban extensions amounted to 3,701 mi. at the close of 1941. Disbursements from the highway fund for the fiscal year ending June 30, 1944, amounted to \$4,315,109.68. In 1941 there were 992 mi. of steam railways in the state. The number of telephone subscribers' stations in operation in 1943 was 87,116.

**Banking and Finance.**—As of June 30, 1945, there were in New Hampshire 52 national banks with deposits of \$171,475,000 and resources of \$188,294,000, as compared with deposits and resources, respectively, on June 30, 1944, of \$141,894,000, and \$158,167,000. Fifty-five state-chartered banks reported deposits of \$290,318,000 and resources of \$325,566,000 as compared with \$253,173,000 and \$282,950,000 respectively, on June 30, 1944. There were 25 state-chartered building and loan associations with resources of \$16,072,000. State-chartered savings banks and savings departments of trust companies reported deposits of \$276,122,319.46 as of June 30, 1945, representing an increase of \$34,308,151.62 over the preceding year, the largest annual increase ever reported. The number of savings accounts was 358,610, an increase of 17,011 over the preceding year. Two federal savings and loan associations reported assets of \$15,224,687, with savings deposits of \$11,888,432. It was estimated that an additional \$30,000,000 of savings were accounted for by the deposits of savings departments of national banks.

Cash receipts of the state treasury department for the fiscal year ending June 30, 1945, were \$31,969,284.25; cash disbursements \$30,875,930.28; cash balance, June 30, 1945, \$6,059,722.32. Gross fixed bond and note debt, June 30, 1945, \$11,171,000; net bond and note debt \$7,421,124.74.

**Agriculture.**—In 1945 there were 19,243 farms in New Hampshire, with a total acreage of 2,043,054. The total harvested acreage of the principal crops was estimated at 383,210 for 1945. Estimated cash income from farm crops (1944) \$8,567,000; from livestock and livestock products \$32,090,000; from government payments \$1,878,000. In 1943 the value of products consumed on farms where produced was estimated at \$5,826,000.

Leading Agricultural Products of New Hampshire, 1945 and 1944

Crop	1945 (est.)	1944
Corn, bu. . . . .	546,000	640,000
Oats, bu. . . . .	252,000	259,000
Hay, tons . . . . .	422,000	360,000
Potatoes, bu. . . . .	986,000	1,064,000
Apples, bu. (commercial) . . . . .	139,000	778,000
Maple syrup, gal. . . . .	25,000	37,000
Maple sugar, lb. . . . .	9,000	25,000

Unseasonable weather conditions reduced the apple crop and the production of maple sugar to a fraction of their normal size.

Lumber production in 1944 amounted to 281,000,000 bd.ft., as compared with 392,000,000 bd.ft. in 1943, the decrease being attributable to loss of labour to the armed services and to war industry.

**Manufacturing.**—Estimated value of manufactures in 1943 was \$393,055,000, an increase of 65% over 1939. The number of persons employed in industry (1943) was approximately 102,000. Principal manufactured products in peacetime included boots and shoes; cotton, woollen and worsted goods; wood and lumber products, including pulp and paper; and machinery. Since New Hampshire's wartime production emphasized an increased quantity of peacetime manufactures, the state did not face serious problems of conversion or reconversion.

New Hampshire enjoyed an estimated annual income of \$75,000,000 from recreational enterprises, which ranked next to

manufacturing and ahead of agriculture as a source of revenue.

**Mineral Production.**—Total value of minerals produced in 1943 was \$1,350,000. The mining of mica was resumed on a substantial scale in 1942, to aid in meeting war requirements. Other state mineral resources exploited were feldspar, sand and gravel, stone and clay products. (W. E. Ss.)

**New Hebrides:** see FRENCH COLONIAL EMPIRE; PACIFIC ISLANDS, BRITISH.

**New Jersey.** **History.**—Sometimes called the "Garden state," New Jersey is one of the three middle Atlantic states. Area, 7,836 sq.mi., including 314 sq.mi. of water; pop. (1940) 4,160,165. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 4,167,840. Capital, Trenton (1940: 124,697). The largest city is Newark (429,760); second is Jersey City (301,173).

The chief political interest in 1945 centred in the legislative elections and the special election in the 4th congressional district comprising Mercer and Burlington counties. The Republican party continued its overwhelming control of both branches of the legislature. The Republicans won 42 seats in the assembly as against 18 for the Democrats, and the senate representation for the 1946 session stood at 17 Republicans to 4 Democrats.

The 4th district election also resulted in a Republican victory that kept the state's congressional delegation Republican by 12 to 2. Due primarily to an intraparty fight among the Democrats, the Republicans in the 4th district elected Frank A. Mathews, Jr., of Riverton to succeed D. Lane Powers who resigned his seat in the house to accept appointment by Governor Edge to the state board of public utility commissioners.

Mathews was opposed by Frank S. Katzenbach III of Princeton and George Pelletieri of Trenton. Katzenbach was the candidate of the Democratic state committee and had the support of the party organization headed by Mayor Frank Hague of Jersey City. Pelletieri was supported by the local Political Action committee of the C.I.O. The three contestants finished in that order with Pelletieri polling sufficient votes to ensure the election of Mathews, who was to serve until a successor was chosen to Powers at the 1946 midterm elections.

The campaign was enlivened briefly by Democratic attacks on the state racing commission, bi-partisan in makeup, over the issuance of a licence for a race track in Middlesex county near Rutgers university, New Brunswick, N.J. The projected track was opposed by Rutgers, churches and civic leaders of the county. The application for the track licence was subsequently withdrawn.

As a result of the controversy, the racing commission adopted a resolution petitioning the legislature to levy on the breakage—the odd pennies remaining in the pari-mutuel pools after each bet is settled—and which for the 50-day season at Camden amounted to more than \$600,000. The commission also granted licences for two more race tracks, one at Long Branch and the other near Atlantic City, both of which expected to begin operations in 1946. Governor Edge recommended that no more than three tracks be licensed.

The 1945 session of the legislature saw the enactment of the Fair Employment Practices act, a measure designed to outlaw racial and religious discrimination in government and industry; extension of unemployment compensation benefits to 26 weeks with a ceiling of \$22 per week; Rutgers university given the status of a state university; and the creation of a state fund to finance returning veterans up to \$3,000 in the establishment of small businesses.

**Education.**—Local costs of education to the 21 counties and school districts for the 1943-44 school year totalled \$109,538,-

924. State aid for the same period was \$16,029,429. Net bonded debt of the state's school system dropped to \$124,155,180 or \$80,556,000 less than in 1933. Enrolment in day schools was 650,052, a decrease of 26,433 from the preceding period, although increases were noted in the lower grades which reflected rises in the birth rate. There was a reduction of 530 in the number of teachers, mainly among men. Salaries of all teachers, including superintendents and those in evening and special classes, aggregated \$65,110,942 for the year. The average salary of the 27,237 day school teachers, exclusive of superintendents, was \$2,296.65, an increase of \$90.22 over the preceding year. Total value of the state's school properties was placed at \$366,-494,724.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The average monthly grant for old-age assistance in 1945 was \$31.74 as against a national average of \$29.46; for dependent children \$58.52 as against a national average of \$47.46; and the average state-aid grant for the blind was \$33.46 compared with a national average of \$29.97. Average salaries of social case workers in 1945 totalled \$2,400, up from a previous high of \$1,800. During 1945 a permanent division of community services for juvenile delinquency prevention was added to the state department of institutions and agencies which controls New Jersey's welfare work.

**Banking and Finance.**—Deposits in 156 state banks, trust companies and savings banks under the supervision of the state department of banking and insurance reached a record high of \$2,718,858,000 as of Dec. 31, 1945. Demand deposits stood at \$1,421,749,000 and time deposits totalled \$1,297,109,000. Federal government deposits represented \$389,554,000 of the total. Government securities made up 62.5% of assets of the institutions for a total of \$2,917,222,000 as compared with 60% for 1944. Cash represented 13.3% of assets as against 14.6% at the close of 1944. The number of commercial banks as of June 30, 1945, was 134; there were 22 mutual savings banks and two especially chartered savings associations under the supervision of the state department of banking and insurance.

**Agriculture.**—Large profits accruing from wartime crops enabled New Jersey farmers by Jan. 1, 1945, to reduce by \$5,480,000 their mortgage indebtedness which on Jan. 1, 1942, stood at an all-time high of \$50,153,000. This trend followed the advice of agricultural leaders who had warned against expansion except on a cash basis. Individuals and commercial banks held 69% or \$40,880,000 of the \$44,673,000 outstanding on mortgages. The Federal Land bank, the Farm Mortgage corporation, the Farm Security administration and life insurance companies held the balance.

As of Nov. 1, 1945, estimates showed New Jersey crop production slightly higher than in 1944. Grains, hay and potatoes were largely responsible for the increase. Nearly all other crops were lighter, especially fruits and truck for processing.

Egg production for the first ten months of 1945 reached 752,000,000 which was 13% below the yield of 859,000,000 eggs produced for the corresponding period in 1944.

**Manufacturing.**—When V-J day arrived, New Jersey's diversified industry had acquired new plants to a value of \$421,300,000 from the start of World War II. Expansion of existing plants in the period from July 1, 1940, represented an investment of \$212,000,000 and an additional \$120,000,000 was spent on the conversion of other facilities to war manufacture. Combined, these expenditures totalled \$753,300,000 and put New Jersey in ninth place in the U.S. in the value of such investments.

(W. R. Ck.)

**New Mexico.** Fourth largest state in the southwestern United States, popularly known as the "Sunshine state"; admitted to the union in 1912. Area 121,666 sq.mi. (121,511 sq.mi. land, 155 sq.mi. water); pop. (1940) 531,818; rural 355,417; urban 176,401; native white 477,065; Negro 4,672; foreign-born 15,247. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 532,212.

**History.**—The administration, legislature and congressional representation were Democratic in 1945. The chief officers of the state during the year were: governor, John J. Dempsey; lieutenant governor, James B. (Jawbone) Jones; secretary of state, Cecelia Tafoya Cleveland; auditor, J. D. Hannah; treasurer, John Bingham; attorney-general, Clyde C. McCulloh;

superintendent of public instruction, Georgia L. Lusk; commissioner of public lands, John E. Miles. A juvenile court was established in each county, a bounty granted on predatory animals, and Aug. 3 was declared Ernie Pyle day.

**Education.**—For the school year 1943-44, 662 rural schools, with 50,925 pupils and 1,594 teachers, cost \$4,245,837.08; 246 municipal schools, with 71,696 pupils and 1,993 teachers, cost \$5,763,595.22.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—During the calendar year 1945, \$24,251.50 was paid out for civilian unemployment benefits; for veterans \$161,969. On June 30, 1945, \$397,434.84 had been spent for old-age and survivors insurance, and \$3,583,679.34 for public assistance.

The penitentiary appropriation was \$157,500 for 504 inmates (Sept. 1); insane asylum, \$415,000 and \$138,474.47 for a three years' deficit, 952 inmates (Nov. 15); School for Mental Defectives \$48,000, 73 inmates; Industrial school \$103,980, 105 inmates (Nov.); Girls' Welfare home \$72,000, 102 inmates (Dec.).

**Communications.**—New Mexico had an estimated 62,683 mi. of roads in 1945; 9,455 mi. constituted the state highway system. For the fiscal year ending June 30, 1945, the state highway department expended \$4,467,899.32. Steam railway companies operated 2,583 mi. of main track (1944). There were 73 airports, and approximately 847 mi. of airways operated by three scheduled air carriers. There were about 53,350 telephones.

**Banking and Finance.**—On June 30, 1945, there were 22 national banks with deposits of \$163,580,000; loans \$29,140,000; investments \$84,600,000; and 19 state banks with deposits of \$56,676,000; loans \$7,759,000; investments \$30,425,000. Total resources of 11 building and loan associations in 1944 were \$4,882,397.38 and of seven federal savings and loan associations \$4,383,210.43.

The total of all state receipts for the fiscal year ending June 30, 1945, was \$35,355,509.67; expenditures \$35,858,043.98. The gross and net debt were respectively \$20,628,000 and \$20,476,579.11.

**Agriculture.**—The total value of agricultural production in 1945 was \$41,544,000; acreage harvested 1,313,000. Livestock was valued at \$97,250,000, Jan. 1, 1945.

Table I.—Leading Agricultural Products of New Mexico, 1945 and 1944

Crop	1945 (est.)	1944
Wheat, ton . . . . .	438,000	458,000
Grain sorghums, bu. . . . .	504,000	5,560,000
Wheat, bu. . . . .	2,328,000	3,186,000
Corn, bu. . . . .	2,400,000	3,510,000
Beans, bags . . . . .	238,000	724,000
Cotton, bales . . . . .	107,000	116,000

**Manufacturing.**—Manufactured products were valued at \$25,123,641 in 1939; an average of 3,250 employees received \$2,912,993 in wages.

**Mineral Production.**—Potash was New Mexico's chief mineral in 1945.

Table II.—Principal Mineral Products of New Mexico, 1945 and 1944  
(Year ending Oct. 31)

Mineral	Value, 1945	Value, 1944
Copper . . . . .	\$13,454,179	\$17,116,956
Potash . . . . .	13,940,753	13,620,367
Zinc . . . . .	6,451,011	9,193,478
Coal . . . . .	5,200,901	5,709,027
Lead . . . . .	903,053	663,916
Silver . . . . .	242,162	256,373
Gold . . . . .	149,846	125,512

The total value of minerals produced was \$41,935,755. (F. D. R.)

**New South Wales.** A state of the Australian commonwealth, lying in the southeast and occupying 309,432 sq.mi.; pop. (est. June 30, 1944) 2,870,956. Chief cities: Sydney, capital (1,398,000); Newcastle (120,000). Governor (1945): Captain the Rt. Hon. Lord Wakehurst.

**History.**—Lord Wakehurst's appointment as governor was extended in 1945 for a further period. During the year the state premier, W. J. McKell, accompanied by two departmental secretaries, visited the United States and Britain. This was in conformity with the state government's announced policy that ministers and senior departmental officers should study overseas developments which might assist to solve problems in New South Wales. In March Sydney's new graving dock, the largest in the southern hemisphere, was opened by the governor-general, the duke of Gloucester, and was named by the duchess the "Captain Cook." The dock is 1,033 ft. long; 154 ft. wide; 47 ft. deep, and has a flooding capacity of 55,000,000 gal.

Heavy autumn and winter rains ended the severe drought conditions which had prevailed for nearly two years. Losses to the agricultural and pastoral economy had been calamitous and for the first time for nearly a century wheat was imported into the state. Prospects for the ensuing season were favourable.

**Education.**—In 1942: number of schools (state) 2,864 (private) 719; teachers (state) 11,112 (private) 3,886; scholars enrolled (state) 350,962 (private) 103,692; average attendance (state) 275,722 (private) 84,718.

**Finance.**—In 1943-44: revenue \$231,900,000; expenditure \$227,100,000; debt outstanding (June 30, 1944) \$1,126,100,000. (Conversion rate £A1=\$3.2 U.S.)

**Communication.**—Roads (1940) 126,058 mi.; railways, government (Sept. 1944) 6,128 mi.; tramways (June 1943) 172 mi.; motor vehicles licensed (Dec. 1944): cars 184,364, commercial vehicles 93,644, cycles 15,546. Wireless receiving set licences (Jan. 1945) 564,184. Telephones (June 1941): exchanges 2,018; instruments connected 280,161.

**Agriculture, Manufacturing, Mineral Production.**—Production (in short tons): wheat (1944-45) 540,000; butter (1943-44) 43,930; wool, greasy (1943-44) 268,500; maize (1943-44) 70,000; coal (1942) 13,700,000; gold (1942) 77,249 fine oz. Industry and labour, 1943-44: factories 10,775; employees (average) 323,032; gross value of output \$1,248,450,000; unemployment (trade union returns) (Feb. 1945) 1.5%. (W. D. MA.)

**Newspapers and Magazines.** United States.—For U.S. newspapers, 1945 was a year crowded with news events of outstanding popular interest, breaking almost daily, which taxed all the modern devices of rapid communication; a year which carried World War II to two final victories thousands of miles apart in its first eight months and then shifted into equally news-worthy postwar reconversion and labour strife. In trying to give this news to a public clamouring for more than could be printed, the newspapers struggled against increasing shortages of paper and of manpower.

A quick survey of the year is seen in the list of Biggest News Events announced at the end of 1945 by the United Press: President Roosevelt dies at Warm Springs, Ga., April 12; Italian partisans execute Mussolini, April 28; Hamburg radio announces Hitler's death, May 1; Germany signs surrender at Reims, May 7; United Nations organize for world peace at San Francisco, charter completed June 26; Labour party wins British election, July 26; Bomber crashes into Empire State building, July 28; Potsdam declaration, Aug. 2; President Truman reports use of first atomic bomb on Japan, Aug. 6; Truman announces Japan accepts surrender terms, Aug. 14; German war criminals go on trial at Nuernberg, Nov. 20; and U.A.W. strike at General Motors, Nov. 21. Associated Press and International News service listed the same events but both put atomic power in first place.

Because of rapid communication provided by radio and Press Wireless, the U.S. people were ringside spectators of the closing months of World War II, beginning with the last stand of the nazis in the Belgian Bulge, the invasion of Germany, the closing in on Japan via Okinawa, the two atomic bombs and final surrender. And, accordingly, there were false alarms. The false armistice story of World War I in 1918 had its counterpart in the premature V-E day announcement of the German surrender at Reims sent by Edward Kennedy of Associated Press on May 7, a day ahead of official release following an earlier A.P. "false peace flash" on April 28 from San Francisco. Again on Aug. 12 the United Press carried a "false flash" prematurely announcing Japanese surrender, but only radio circulated it. The death of President Roosevelt on April 12 caught newspapers at a bad time of day, 5:49 P.M. eastern war time, but even college dailies got out extras. "The week of weeks" in the newspaper offices was April 28-May 4 which brought the headlines: "Munich Revolts," "Mussolini Killed," "Reichstag Seized," "Hitler Suicide," "Berlin Captured," "Italy War Ends" and "Hamburg

ERNIE PYLE, Scripps-Howard writer endeared to the infantry for whom he spoke, smoking with some U.S. marines during a short lull in the battle of Okinawa. Pyle was instantly killed by Japanese machine-gun fire on Ie Jima, April 18, 1945

Falls." One of the largest gatherings in the history of newspaper and radio reporters, at least 1,800, covered the United Nations conference in San Francisco, April 25 to June 26. To impress on U.S. minds the picture of nazi "atrocities," the war department took 17 newspaper and magazine editors to Germany in April, and their eyewitness accounts flooded the press; the *St. Louis Post-Dispatch* displayed for thousands an exhibit of huge enlargements of atrocity photos. An all-time record of 348 correspondents attended President Harry S. Truman's first press conference on April 17 and approved ending of censorship on presidential whereabouts. After President Truman announced the first atomic bombing, Hiroshima Aug. 6, the war department selected William L. Laurence, *New York Times* science writer, to explain it to the public. On Aug. 30, the *New York Times* did the unusual in printing the entire 130,000-word Pearl Harbor report in one 16-page supplement. The final big war story of the year, the Nuernberg trial of German war criminals opening Nov. 20, drew a gallery of 325 correspondents from 23 countries, including about 100 from the United States. In contrast, the greatest conclave of sports writers in history, about 300, gathered in Chicago in Oct. 1945 for the baseball world series. A spectacular stunt in October was the flying of three press agency writers, including one woman, on the first six-day round-the-world flight of the "Globester" of the air transport command.

The close of the war brought summaries of press activities. The three major press agencies totalled their war dispatches at 270,000,000 words, of which 16,000,000 were transmitted by Press Wireless mobile transmitters in Paris and Manila. Casualties among U.S. correspondents totalled 149, including 38 writers and photographers killed and 36 awarded the Purple Heart, out of a grand total of 600 to 800 correspondents at the various

battle fronts. Most notable press casualty was Ernie Pyle, popular war columnist, killed on Ie Jima on April 18. When Manila was liberated, 11 newsmen were freed from Japanese prison camps. Captured German records revealed that an A.P. man had been executed by the nazis. While 24 women were listed among the war correspondents, women were filling newspaper offices and press agency bureaus at home as never before; even after the death of her husband, Eleanor Roosevelt continued her syndicated column, "My Day." The most famous photograph taken during the war was Associated Press Joe Rosenthal's picture of the U.S. marines planting their flag on Mt. Suribachi, Iwo Jima. Early in May Censorship Director Byron Price cut back restrictions to a minimum and on Aug. 15 closed his office. On Sept. 5, the Office of War Information was transferred to the state department; Elmer Davis resigned on Sept. 15 and returned to CBS as news commentator. The greatest war secret, the atomic bomb, it was announced in August, had remained secret because of voluntary censorship by newspaper and radio men who had known of it long before. A final tally totalled 600 army newspapers published in various theatres, and the greatest of all, *Yank*, was suspended Dec. 31 after attaining a circulation of 2,500,000. The *New York Times Overseas Weekly*, printed from plates flown from New York, was issued in Manila and ten other foreign capitals; the *Chicago Overseas Tribune* appeared in Honolulu, Manila, Bremerhaven and Tokyo.

The greatest fund drive of the war was the Seventh or Victory Loan campaign in the fall which was geared to a goal of \$11,000,000,000 including \$85,000,000 in E bonds. After backing the Sixth loan with \$24,000,000 in free space and attaining a grand total of \$88,000,000 in the first six drives, newspapers carried \$42,635,459 worth of free ads for the Victory loan, including 110,230 appeals totalling 78,000,000 lines. Newspaper carrier boys by October had sold 1,704,000,000 ten-cent war stamps, 10% of all the stamps sold after Pearl Harbor, and were seek-

# BRITANNICA BOOK OF THE YEAR

THE PICTURES on these pages were submitted with hundreds of others in the *Britannica Book of the Year* News Photography Contest for 1945. These were selected as the best in each of four classifications, and were awarded first prize.

## ← WAR NEWS AND FEATURE

This celebrated photograph by Joe Rosenthal of the Associated Press, showing the raising of the flag over Mt. Suribachi, Iwo Jima, in Feb. 1945, was awarded first prize. It was the outstanding war photograph of the year, perhaps of the entire war. Charles P. Gorby, another Associated Press photographer, took second prize with "Tojo's Last Plot Fails," and third prize went to Charles Haacker of Acme Newspictures for a scene "They Will Know Food Again" of Buchenwald concentration camp victims.

## SPORTS →

Matthew Zimmerman of the Associated Press made this first prize-winning photograph "Smash Hit," while "Big Run," a baseball action shot by Thomas Linton of the *Detroit Free Press* took second place, and the third award went to James N. Keen of the *Dayton Journal-Herald* for a football scene.

# NEWS PHOTOGRAPH WINNERS

## ↑ NONWAR FEATURE AND PICTORIAL

Caroline Valenta of the *Houston Post* snapped this happy scene "Daddy, Daddy, Daddy" as a soldier was being greeted by his son, wife and daughter upon his return in 1945 from service abroad, and was awarded first prize. Second and third prizes went to Robert Boyd of the *Milwaukee Journal* for "Christmas Program" and to James N. Keen of the *Dayton Journal-Herald*

## ← NONWAR SPOT NEWS

Gib Brush of the *Los Angeles Daily News* was awarded first prize for this photograph of "Maklin (Porky) Hall, Strike Breaker" crashing a picket line at Warner Brothers studio in Oct. 1945

Second prize went to Samuel Falk of the *New York Times* for a photograph "Untimely News," showing commuters reading newspaper accounts of the death of President Roosevelt, and third prize to Chester Gabrysiak of the *Chicago Tribune* for "Hit Run," a shot of a sailor traffic victim and his friends

ing to pass the 2,000,000,000 mark by the end of the year. The waste paper salvage campaign was carried on with increased vigour by the Boy Scouts and other school children, and in rural areas an increased fat salvage campaign was waged.

Shortage of print paper was the greatest problem in the newspaper offices and became more serious at the end of 1945. Although there had been no price increase after Sept. 1, 1943, a rise of \$3 a ton was approved on March 29, 1945, and another of \$6 a ton on Dec. 7, carrying the price to \$68 a ton. Through voluntary control of a sliding scale, newspapers during the year reduced their paper consumption, from 20% for the smallest to 37% for the largest, below 1941 consumption. As the proposal of continuing the voluntary L-240 control by the Newspaper Advisory committee under the War Production board was opposed by 85% of the press, all paper controls ended on Dec. 31. Realizing that Canadian newsprint production would be 3% below 1941 and U.S. production further curtailed in 1946, newspapers at the end of the year were trying to avoid "a mad scramble for paper" by setting up a "Good Neighbour Share-the-Paper" plan through newspaper organizations. To stay within their quotas, newspapers curtailed want ads, ran adless editions and abandoned victory editions. Meanwhile, quotas of magazines, using different paper, eased 5% in August.

Labour troubles that had been simmering all year grew into an unprecedented outbreak of strikes. Most notable was the strike on July 1 of 1,700 members of the Deliverers union in New York city which prevented delivery of 17 newspapers for 17 days; only *PM* was not involved, and counter sales of other newspapers went up to 650,000 on one day. A similar strike in St. Louis held up all newspapers three weeks in September. Argument over new contract rules of the International Typographical union continued through successive publishers' meetings and led to a wave of composing room strikes during the summer and fall which tied up newspapers, from a few days to 16 weeks, in the following cities: Fort Wayne, Ind., Jersey City, N.J., Birmingham, Ala., San Antonio, Tex., four Chicago suburban papers, Reading, Pa., six cities in Montana, Utica, N.Y., Uniontown, Pa., Seattle, Wash., Des Moines, Ia., St. Petersburg, Fla., Portsmouth, O. and Windsor and Winnipeg, Canada. Many "struck" newspapers continued their news gathering and published photographic engraved editions or put out their news by radio. The huge General Motors strike in November cost publications \$7,000,000 in cancelled automobile advertising contracts.

The campaign for world-wide free press continued. A free press mission of three men delegated by the American Society of Newspaper Editors Dec. 28, 1944, Wilbur S. Forrest, *New York Herald Tribune*, Ralph E. McGill, *Atlanta Constitution* and Carl W. Ackerman, Columbia university, made a three-month trip around the world visiting London, Cairo, Iran, Moscow, China, India, Australia, New Zealand and South America. A free press resolution was adopted at the Mexican conference in March, five more U.S. state legislatures voted endorsement and free news flow was encouraged by the British-American Telecommunications conference in Bermuda in December. Press freedom was established in Italy and France in January, in Germany in May, in Austria in August, in Japan in September and to some extent in South America in December. But there continued to be battles over censorship: the press was restrained at the Institute of Pacific Relations in January; many arguments about "political censorship" waged over the S.H.A.E.F. military news regulations in occupied Germany; 100 or more correspondents "sat outside" at the Big Three conference at Potsdam in July; and the state of soviet censorship was still being debated at the end of the year. Even so, newspapers opposed the free press rider attached to the United Nations Relief and Rehabilitation Administration relief bill by congress.

The government's antitrust suit against the Associated Press, started on Aug. 28, 1942, by the U.S. department of justice at the instance of the *Chicago Sun*, ended three years in the courts with A.P. defeat at a total cost of \$234,592. After the two-to-one decision of the New York circuit court of appeals on Oct. 6, 1943, A.P. appealed through oral argument before the U.S. supreme court on Dec. 5-6, 1944. The A.P. finally lost its case in a five-to-three decision of the supreme court handed down on June 18, reaffirming the Jan. 13, 1944, ruling of the lower court; each of the eight justices wrote a separate decision totalling 22,000 words. A.P. directors on Sept. 7 filed a petition for rehearing, but this was denied on Oct. 8, and a stay of 120 days was set for compliance. Meantime Col. R. R. McCormick of the *Chicago Tribune*, urged appeal to congress. On Nov. 28, at a special meeting, 125 A.P. members, armed with 948 proxies, revised the membership rules to conform, voted 949-34 to admit the *Chicago Sun* as an associate member (because of its U.P. contracts) and by 962-23 vote admitted the *Washington Times-Herald*, *Oakland Post-Enquirer* and *Detroit Times* to full membership. (Col. McCormick seconded the motion to admit the *Chicago Sun*.) The only other publication law suit of interest during 1945 was the decision early in June of the U.S. court of appeals returning the second-class mail privileges to the magazine, *Esquire*, reversing the Feb. 28, 1944, ruling of Postmaster-General Frank C. Walker.

The first colour picture transmitted by radio was sent to New York from the Big Three meeting in Potsdam on Aug. 9, and A.P. announced it had sent 150,000 wirephotos in ten years. Press Wireless developed new transmission services from Leyte, P.I., Shanghai and Buenos Aires and set up a new research station on Long Island. Daily circulations increased 6.4% to an all-time record of 46,000,000, and business offices announced

gains in both local and national advertising, as well as higher advertising and circulation prices, so that more than half the dailies were selling for five cents by March and readers spent more than \$800,000,000 for their newspapers during the year. Paris fashions came back into the news. With the decline of war news, radio stations began developing local news facilities. Because of the wartime ban on travel, the annual meetings of most newspaper groups, A.P., A.N.P.A., A.S.N.E., Inland, were abandoned, but American Newspaper guild held its 12th convention in St. Paul, Minn., on June 28, and Inland Daily Press resumed triyearly meetings Oct. 17. National Newspaper week was observed Oct. 1-8 with the theme, "A Free Press, Torch of World Peace." Moses Koenigsberg, 67, founder of King Features syndicate, died on Sept. 21, and Mrs. Marie M. Gasch, 70, creator of the "Beatrice Fairfax" column, died Nov. 15. Schools of journalism announced a new plan of accrediting schools and, while enrolment soared in the fall, a number of teachers staffed the Overseas Army university. The first school of journalism in Canada opened at London, Ont., in October.

**Magazines.**—Because of paper shortage, magazines became thinner. They used lighter paper and rejected more advertising; some froze circulations. Later in 1945, as the magazine paper situation eased, a few new projects were announced. Curtis Publishing Co., Philadelphia, Pa., on Oct. 15, announced a new recreation and travel monthly, *Holiday*. David Lawrence, publisher of *United States News*, Washington, announced on Dec. 15 a newsmagazine, *World Report*, devoted to international affairs. A newsmagazine, *Moderator*, was launched Aug. 30 in Boston. A Sunday roto tabloid magazine devoted to Ohio affairs was started by the *Columbus Dispatch* Oct. 7. Rumours of a new daily newsmagazine, *AM*, to be published in New York by Jacob A. Lazar, began in April but by fall the project was still in "rehearsal" stage. Marshall Field, after incorporating his New York daily as The Newspaper PM, Inc., on Dec. 30, 1944, purchased in Dec. 1945, the Quarric corporation, Chicago, publishers of *World Book Encyclopedia* and *Childcraft*. *Time* magazine in January purchased a site for a \$2,000,000 publishing plant in Los Angeles, Calif., and in February spent more than \$2,000,000 for a plant in Chicago. The OWI in August abandoned its picture magazine, *Voir*, and the war department suspended *War Times*, official weekly, in December.

(G. M. Hy.)

**Great Britain.**—The closing down of the press censorship division at the ministry of information on Sept. 2, 1945, brought to an end exactly six years of press censorship based upon voluntary co-operation. With Admiral G. P. Thomson in charge during that period there were 665,000 submissions containing 183,000,000 words, and out of 400,000 different issues of the press only four prosecutions on censorship grounds were instituted.

The British press covered the final stages of the European war with customary zeal and thoroughness. Occasional complaints of irksome restrictions served to emphasize the general co-operation that prevailed from D-day to the investment of Berlin. At the end of the European war arrangements were completed for extensive press coverage in the far east, and particularly for the invasion of Malaya and Japan. The atomic bomb and the sudden collapse of Japan took the British press by surprise, but large reporting and photographic staffs were available for the surrender scenes, and release and return of prisoners of war and civilian internees. When secrecy was no longer imperative the British press published stories of wartime aids to victory, of the operations called "Pluto," "Fido," "Mulberry," and so on, and of the wonders of radar, etc. Almost daily for a long period a fresh secret was revealed.

With the return of peace the press had ready their plans for expansion and development, but execution of these depended upon the supplies of newsprint and availability of manpower. It was expected that the need for large occupation forces in many theatres of war and the employment of much shipping tonnage would be retarding factors. The communist *Daily Worker* had ready an expansion scheme for a normal-sized paper to obtain a daily circulation of 250,000 as an immediate objective and 500,000 as a medium objective, with a final objective of breaking all circulation records. The supply of newsprint was still difficult. A 10% increase was granted just before the general election to enable more copies of newspapers to be printed for home and overseas.

Circulation figures continued to grow. The *Radio Times* passed the 4,000,000 mark, having added 1,000,000 during the war. The *London Evening News* claimed the largest world circulation for an evening paper with an average of 1,044,356 daily. The *Daily Express* exceeded 3,300,000 a day, and the immediate target was 4,000,000.

Steps were taken to end the conflict between the Institute of Journalists founded upon royal charter and the National Union of Journalists, a trade union affiliated to the Trades Union congress. After negotiations it was decided to ballot the members of both organizations on a merger proposal.

There were 60 journalists who were parliamentary candidates at the general election, and 21, the majority Labour, were returned.

The king in August conferred upon Lord James G. B. Kemsley, chairman of Kemsley Newspapers, Ltd., the honour of viscount.

Odham's Press, Ltd., acquired a controlling interest in Transport (1910), Ltd. and its subsidiary companies publishing numerous successful magazines dealing with railways and shipping, and Lord Julius S. E. Southwood became chairman. The *Financial News* took over the *Financial Times*, and the copyright belonging to the Camrose family was purchased for £280,000. For the second quarter of 1945 advertising amounted to £3,661,342, which represented a drop of 0.23% when compared with the corresponding period of the previous year.

Company profits included George Newnes £148,398 (£138,877); Odham's Press £959,981 (£798,708); Associated Newspapers £659,911 (£623,405); Kemsley Newspapers £480,843 (£471,173); Illustrated Newspapers £101,150 (£85,337); *Sunday Pictorial* £125,205 (£127,310) and *Daily Mirror* £112,955 (£97,180).

Appointments during the year were: Herbert Gunn, editor, *Evening Standard*; Cecil Thomas, editor, to board of directors, *Daily Mirror*; Walton Cole, managing editor, *Reuters*; T. W. Hutton, editor, *Birmingham Post*. During 1945 occurred the deaths of Sir Bernard Partridge (83), *Punch* cartoonist for 50 years and Capt. F. D. Bone of the *Daily Express* news centre. (See also ADVERTISING.) (S. R. C.)

**New York.** One of the original 13 states of the United States, popularly known as the "Empire state," New York covers an area of 49,576 sq.mi., of which 1,647 are water. With a population of 13,479,142 (federal census, 1940) and an estimated population of 13,946,957 (state division of vital statistics, July 1, 1945, up 3.5%), it retained its place as the most populous state. The foreign-born population was 2,853,530 in 1940, and the urban population 11,165,893. Albany is the capital, estimated 1945 population, 133,331. The 1945 population of New York city, almost twice the size of any other city in the country, was estimated at 7,730,383, up 3.7% from 1940; population of Buffalo, the state's second largest city, increased 6.2% to 611,336 and the neighbouring community, Niagara Falls, showed the greatest increase, 16.2% to 90,668. Among the other cities, 1945 population (including men and women in the armed services) and percent changes were: Rochester 333,442 (up 2.6%), Syracuse 220,299 (up 7%), Yonkers 140,258 (down 1.6%), Utica 102,834 (up 2.3%), Schenectady 95,745 (up 9.4%), Binghamton 79,781 (up 1.9%), Troy 69,845 (down 0.7%), Mt. Vernon 66,256 (down 1.6%), New Rochelle 57,449 (down 1.6%) and Elmira 50,512 (up 12%).

**History.**—To clear the tracks for business conversion from war production and to assist industry to full employment of the state's labour resources, the Governor's Reconversion Service agency was created by the governor, Thomas E. Dewey, Aug. 20, 1945. M. P. Catherwood, chairman, Charles H. Sells and Edward Corsi, commissioners of commerce, public works and labour respectively, were appointed by Governor Dewey and part of the staff of the state war council was transferred to the department of commerce to help carry out the purposes of the agency. The state department of commerce worked with industry throughout the state to develop business and employment opportunities, with special emphasis on small business expansion.

The division of veterans' affairs in the executive department was created by the 1945 legislature with an appropriation of \$2,825,000; Edward J. Neary, state director. Veterans were being assisted in numerous ways including advice on re-employment, education, welfare, job training and business opportunities. Governor Dewey negotiated the transfer of army and navy housing facilities for conversion into homes for veterans and their families.

The legislature, on the governor's recommendation, also extended insurance benefits for unemployed workers up to \$21 a week for a maximum of 26 weeks and enacted unemployment insurance experience rating for employers in New York state who make a successful effort to maintain stable pay rolls. This resulted in tax credits to qualified employers totalling \$76,500,000, applicable to contributions for the year beginning July 1, 1945.

The administration of workmen's compensation was improved and coverage extended. The Ives-Quinn Anti-Discrimination bill was passed, also bills creating a state youth commission designed to combat juvenile delinquency; giving municipalities the right to acquire property in blighted areas for rehabilitation; providing for additional loans for public housing and raising the limit on state subsidies for housing.

Both in 1945 and 1944, large surpluses of \$163,000,000 and \$156,000,000 at the end of the state fiscal year (March 31) were transferred on recommendation of the governor to the Postwar Reconstruction fund, which was expected to total nearly \$500,000,000 on April 1, 1946, the end of the fiscal year. Altogether, about \$800,000,000 in public works construction in the reconversion period was planned by the state.

Appropriations from the general fund at the end of the 1945 session totalled \$370,000,000 as compared with \$368,000,000 in

1944. At the same time, the state personal income tax was reduced by one-fourth for the second year. A further reduction in 1946 was anticipated.

State financial assistance to municipalities was increased. More than \$100,000,000 was distributed to localities as their share of the personal income, franchise, utilities, motor vehicle, motor fuel and alcoholic beverage taxes. In addition the state paid out almost \$150,000,000 to localities for support of common schools, for relief and welfare and other state aid. Altogether 42% of state tax revenues was returned to localities in aid or shared taxes. The Republican party continued in control of the state administration and both houses of the legislature.

**Education.**—During the school year ending June 30, 1944, the last year for which complete figures were available, there were 992 public high schools, with 583,089 pupils and 7,543 elementary schools, with 1,296,901 pupils. The total cost of maintaining the schools exclusive of money raised by bonds was \$347,016,624. In addition to the public schools there were 110 colleges and universities, including 11 teachers' colleges, with 122,301 students and a teaching staff of 14,330. A new commissioner of education, Colonel Francis T. Spaulding, was appointed by the board of regents Nov. 15, 1945, to take office July 1, 1946.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The number of persons receiving public assistance was 165,114 in Sept. 1945 (as against 170,951 in Sept. 1944 and 198,606 in 1943) for whose relief \$7,200,000 was spent (compared with \$7,000,000 and \$7,500,000 respectively). The amount spent for home relief during Sept. 1945 was \$1,600,000, down 12% from 1944; \$3,850,000 for old-age assistance, up 3.9%; \$1,600,000 for aid to dependent children, up 17.3%; and \$120,000 for assistance to the blind, up 9.6%. The state operated 26 hospitals, 18 of them for the mentally ill, two for the criminal insane. There were eight state prisons, three reformatories and three institutions for defective delinquents.

**Communications.**—In addition to the 7,707 mi. of railroads, there were in New York state on Jan. 1, 1945, exclusive of streets in cities and incorporated villages, 83,113 mi. of highways, of which 70,334 mi. were town and country roads. Of the total, 59,448 were classified as improved. The state maintained a system of more than 450 mi. of canals including the Erie 340; the Champlain 63; the Cayuga-Seneca 27 and the Oswego 24. Including the rivers and lakes which were part of the New York State Barge Canal system, the total length was 800 mi. Although no tolls are charged, the canals and waterways yield a revenue of more than \$650,000 a year from the use of terminals, the sale of water power and the operation of grain elevators. Air transportation was being developed in New York state with the help of the newly created bureau of aviation in the state department of commerce.

**Banking and Finance.**—New York's share of total personal savings accumulated during World War II was estimated at \$30,845,558,063. As reported on Dec. 31, 1945, deposits in approximately 300 banks in New York state were as follows: savings banks \$8,292,000,664 (resources \$9,171,941,066); state banks and trust companies \$22,205,867,610 (assets \$24,168,737,199); industrial and private banks \$154,573,426 and \$193,116,363 respectively.

**Agriculture.**—Total farm acreage in New York state jumped to 17,722,081 ac. in 1945 under the extensive wartime farm production program. The average New York state farm chalked up a 3% increase in size during the war, making the total acreage included in the 153,358 farms listed by the 1945 agricultural census substantially greater than in 1940 (17,170,337 ac., 153,258 farms). The acreage of principal crops harvested, excluding orchards and vineyards, had increased to 6,680,000 in 1944, as compared with 6,506,000 in 1940. Total milk production was about 7,700,000,000 lb. in 1944. Even with heavy demand for chicken and poultry products to supplement the over-all meat supply, there were almost 10,000,000 chickens on farms in New York state in mid-1945. A state commission on agriculture was created to launch a long-range program to aid the farmers and consumers of New York state.

Table I.—Marketings of Principal Products from New York Farms, 1944 and 1943

	1944	1943
Milk and dairy products . . . . .	\$251,800,000	\$242,559,000
Cattle and calves (and other livestock) . . . . .	32,817,000	41,183,000
Poultry and eggs . . . . .	100,726,000	99,785,000
Vegetables, potatoes and beans . . . . .	101,672,000	101,979,000
Fruits . . . . .	59,921,000	40,836,000

**Manufacturing.**—In 1939, according to the biennial manufacturing census (none was taken during World War II), there were 34,506 manufacturing establishments employing 957,844 persons, paying \$1,163,785,198 in wages and producing goods valued at \$7,134,400,147.

Total war supply and facility contracts awarded to manufacturers in New York state amounted to \$23,058,000,000 during the period June 1940 through the second quarter of 1945, which was 10.1% of the national total.

**Mineral Production.**—The value of the leading mineral products of New

Table II.—Principal Industries of New York, 1939 and 1937

Industry	Value of products	
	1939	1937
Clothing . . . . .	\$1,107,535,000	\$1,061,543,000
Printing and publishing . . . . .	572,625,000	576,731,000
Bread and other baking products . . . . .	242,883,000	243,836,000
Automotive products . . . . .	197,885,000	114,924,000
Fur coats and other fur garments . . . . .	151,258,000	133,906,000
Steel works and rolling-mills . . . . .	116,112,000	157,810,000

Table III.—Principal Mineral Products of New York, 1944 and 1943

	Value	
	1944	1943
Cement (Portland—natural) . . . . .	\$ 7,037,000	\$ 8,765,665
Coke . . . . .	...	39,091,561
Gypsum (Calcined—crude) . . . . .	4,336,000	4,030,000
Petroleum . . . . .	15,593,000	15,230,000
Pig Iron . . . . .	9,900,000	79,873,775
Salt . . . . .	8,211,000	9,328,672
Stone (including limestone) . . . . .	...	8,917,164
Zinc . . . . .	...	9,936,000

York for the years 1944 and 1943 are shown in Table III (1944 data for coke, pig iron and zinc were not available). (H. K.E.)

**New York City.** In the 1940 census New York city, the largest in the United States, had a population of 7,454,995; unofficial estimates place the figure in 1945 at about 7,730,383. Mayor: William V. O'Dwyer, Democrat, who took office Jan. 1, 1946, following the overwhelming Democratic victory in the November municipal election. The city's budget for the fiscal year ending July 1, 1946, was \$751,527,715, an increase over the previous year of \$21,847,270. The tax rate was \$2.66 on every \$100 of assessed valuation, which was a drop of 8 cents from the previous year. This decrease was made possible by increased revenue, largely from higher real estate valuations.

The Democratic administration which took over at the beginning of 1946 was faced with problems left over from the three-term, 12-year regime of Fiorello H. La Guardia as mayor. At the same time the La Guardia administration had been regarded as generally successful by virtually all shades of political opinion. In declining to run for a fourth term, La Guardia left the way open for a three-cornered race for mayor between O'Dwyer, a native of Ireland, a former labourer, policeman, lawyer, city magistrate, district attorney of Kings county and brigadier-general, who was supported by the Democratic organization and the American Labor party; Judge Jonah J. Goldstein, a judge of the court of general sessions, a Democrat who was indorsed by the Republicans, the Liberal party and the City Fusion party; and Newbold Morris, then president of the city council, who ran on the newly-formed No Deal party with the backing of La Guardia. In this campaign there were no clear-cut issues of any importance, and the charge that the election of O'Dwyer would mean the return of Tammany graft made little impression on the voters.

One of the first acts of the O'Dwyer administration was to strike from the capital outlay budget \$45,000,000 which had been earmarked for the vast new Idlewild airport on Long Island, and \$10,000,000 for a large market on the west side of Manhattan. The new administration argued that the money could be obtained for these improvements from other sources, and that they should be financed by an "authority," analogous to the port authority, rather than with city funds. The outgoing mayor, La Guardia, who had become a radio and newspaper commentator, protested strongly against these cuts.

The principal problems faced by New York city, which the O'Dwyer administration promised to tackle at once, were: The subways, municipally owned, operated at a loss at a five-cent fare, and were badly run down; housing, which was inadequate to the needs of the city notwithstanding the many new housing developments which were either under construction or in the blueprint stage; traffic congestion, which had steadily grown worse and which experts said would need drastic handling for

THE EMPIRE STATE BUILDING, partially obscured by smoke and flame after a U.S. army medium bomber, flying through fog, crashed into its upper stories on July 28, 1945. Fourteen persons lost their lives in the tragedy

even a partial solution; crime, which had increased alarmingly while the strength of the police force had dwindled by about 4,000 men; the school system, overcrowded and troubled by administrative problems; city finances, which were described by the incoming administration as insufficient to meet necessary expenditures unless new revenue were found; at the same time, the city's credit had been excellent for the last 12 years. O'Dwyer indicated at the beginning of his administration that he would seek state and federal aid in carrying out many of the projected city improvements. He also promised to try to strengthen the city's business and industry. (See also MUNICIPAL GOVERNMENT.)

FILMS.—*Arteries of the City* (Encyclopædia Britannica Films Inc.). (St. W.)

**New York University.** A private coeducational institution occupying six centres in various parts of New York city with undergraduate, graduate and professional schools of liberal arts, fine arts, business, engineering, education, medicine, dentistry, public administration and law. While bearing the name of both the state and the city of its location, it is supported and controlled by neither. A privately governed institution, its operating revenue of some \$9,000,000 in 1944-45 came from student fees, endowment and gifts. The latter approximated \$1,500,000, with \$100,000 from Mrs. Percy S. Straus for fine arts, and the bulk of the remainder for medical training and research. The year marked the launching of a campaign to rebuild the medical school on a \$15,000,000 scale commensurate with the projected reconstruction of adjacent Bellevue hospital. Experiencing a 20% rise in student attendance, the 1945 cumulative summer and autumn enrolment of 30,983 included some 4,200 war veterans. The institution reckoned its war dead at 600, out of some 35,000 under arms,

with 2,500 nonfatal casualties. Serving with the armed forces were 323 members of the faculty, while an additional 113 were on leave of absence in various civilian war research and executive posts. The military trainees at the university, 1941-45, numbered 6,200, and those trained in short courses for service in war contract plants, 23,200. Medical affiliations were effected with Irvington house, Irvington, N.Y., specializing in children's cardiac disorders, and with Lenox Hill hospital of New York city. Dr. Ernest O. Melby, chancellor of the university of Montana, succeeded Dr. E. George Payne on the latter's retirement from the deanship of the school of education. Comptroller LeRoy E. Kimball and Secretary Harold O. Voorhis were each appointed vice-chancellor of the university. (For statistics of enrolment, faculty, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (H. O. V.)

**New Zealand, Dominion of.** A British dominion, consisting of a group of islands, lying in the South Pacific between 34° 25' and 47° 17' S. and between 166° 26' and 178° 36' E. Area: dominion proper 103,415 sq.mi.; other islands, 519 sq.mi.; pop. dominion proper (est. Dec. 31, 1944) 1,655,794 including Maoris (99,482); Cook and other Pacific islands (census 1936) 16,350; Western Samoa (mandate) 66,447 at Dec. 31, 1944. Chief cities (pop., census Sept. 25, 1945): Auckland (with suburbs, 256,426); Wellington (cap., with suburbs, 175,189); Christchurch (112,525); Dunedin (65,487). Language: English. Religion: Christian (1936 figures excluding Maoris: Church of England 600,786; Presbyterian 367,855; Roman Catholic 195,261; Methodist 121,012). Ruler: King George VI; governor general: Lieutenant General Sir Bernard Freyberg, V.C.

**History.**—When the year 1945 opened, New Zealand troops were engaged in hand-to-hand warfare at Faenza in Italy. When the war in Europe finished, they found themselves with a somewhat delicate role to perform at Trieste. When Japan surrendered, the New Zealand division was about to be deployed for the attack on the Japanese mainland. The suddenness of the cessation of hostilities necessitated a swift adjustment of the country's finances and Walter Nash, finance minister, increased his estimates of expenditure to allow for £NZ18,000,000 for gratuities to demobilized servicemen and £NZ5,000,000 for deferred pay. Though no reduction in taxation was envisaged the main budget did provide a number of increased benefits from the social security fund costing £NZ1,800,000 for the year. Total war expenditure to March 31 amounted to £NZ507,000,000. Total public debt amounted in September to £NZ603,000,000. The war cabinet, which had included representatives of the opposition was dissolved in August. Air Vice-Marshal L. M. Isitt represented the dominion at the signing of the Japanese surrender terms. The prime minister, Peter Fraser, attended the commonwealth conference in London before the United Nations conference at San Francisco, Calif., where his efforts on behalf of the smaller nations won for him a considerable reputation and drew from the *New York Times* correspondent a tribute to "one of the leading intellectual figures at the conference." Mr. Fraser described the charter on his return as "much more liberal and democratic than the original draft." New Zealand associated itself with Australia in regret that it had not been consulted before the Potsdam ultimatum to Japan was issued. It supported Australia's efforts to ensure that small nations should have a share in shaping the peace in proportion to their contribution to victory.

In domestic affairs the nationalization of the Bank of New Zealand caused perhaps the most controversy. The prime minister revealed the motive for the government's action when he said: "We believe that in a world depression the state bank can

exercise a stabilizing influence and prevent the country from suffering as severely as it has on past occasions." A royal commission took voluminous evidence on the question of reform of the licensing laws. Goods and services supplied by New Zealand under reverse lend-lease were estimated to amount to more than £NZ70,000,000. The weight of food supplied to United States forces was nearly 1,000,000,000 lb. After July 1942 New Zealand sent to the Pacific a quarter of its vegetables and apples, a seventh of its meat and a twelfth of its dairy produce. By-elections saw a decline in the government vote. A general election was due in 1946.

**Education.**—(Dec. 1942) state elementary schools 2,230, scholars 245,592; secondary 197, scholars 46,389. The University of New Zealand has six constituent colleges, including agricultural colleges at Lincoln and Palmerston North, grouped together as the New Zealand School of Agriculture; university students 4,373. Total cost of education (year to March 31, 1943) £NZ5,038,395.

**Finance.**—(All in £NZ) Revenue, consolidated fund, year to March 31, 1945, £54,248,000, expenditure £53,033,000. Social security fund receipts £18,777,000, expenditure £19,332,000. War expenditure account receipts £138,981,000, expenditure £130,009,000. Note circulation June 1945, £40,560,461; reserve June 1945 (in Reserve bank), gold £2,801,878; exchange £62,417,173. Net overseas funds, May 28, 1945, £70,594,290. Exchange rate: £NZ125 = £100 sterling, £NZ = 324.2 cents U.S., £ sterling = 403.5 cents U.S.

Deposits in post office and trustee savings banks (March 31, 1945) £136,266,000. Taxation by general government, year ended March 31, 1945: consolidated fund: customs revenue £8,471,679; beer duty £2,074,457; land tax £952,622; income tax £25,686,050; racing taxation £1,096,456; motor-vehicles taxation £1,929,618; sales tax £4,063,558; stamp and death duties, £2,282,152; other, £1,414,956; total consolidated fund £45,689,396; social security taxation £14,260,066; war taxation £48,732,352. Total taxation £108,681,814, or £65 ss. 10d. per head of population, including Maoris.

Taxation by local governing authorities, year ended March 31, 1943: rates £7,764,677; licences, etc., £735,548; total £8,500,225. Indebtedness of local governing authorities, March 31, 1943; debentures and other securities (including loans from State Advances corporation and main highways board): gross £63,969,096; net £55,044,086. Loans from treasury (inscribed debt): gross £1,161,978; net (actuarially computed) £180,350. Total indebtedness: gross £65,131,074; net £55,224,436. Gross indebtedness of general government as of March 31, 1944: £566,494,017, or £344 12s. 1d. per head of population.

Aggregate private income, 1943-44: salary and wage payments, £175,900,000; social security benefits and pensions, £15,700,000; company income, £40,900,000; other income of individuals, £59,800,000; total £292,300,000. 1944-45: salary and wage payments, £176,500,000; social security benefits and pensions, £17,400,000.

**Communication.**—Roads paved or surfaced 44,812 mi. (including main highways 12,398 mi.), not paved or surfaced 8,631 mi. Passenger journeys, year to March 31, 1945, 32,954,529 mi.; goods traffic, 8,954,239 tons. Civil aviation, passengers carried March quarter 1945, 14,827. Shipping (1941) entered 2,323,264 tons net; cleared 2,309,469 tons net. Motor vehicles licenced (March 1945) 301,154. Wireless licences 380,128.

**Agriculture.**—1943-44 acreages: wheat for threshing 233,786, total 239,183; oats for threshing 39,652, total 228,887; barley for threshing 28,241, total 36,310; maize for threshing 5,691, total 11,460; linseed for threshing, western wolths and Italian rye grass 11,096; cocksfoot 10,797; tobacco 2,586. Yields, total and per acre: wheat 7,208,485 bu. (30.83); oats 1,834,310 bu. (46.26); barley 832,783 bu. (29.49); maize 296,081 bu. (52.03); peas 888,709 bu. (10.89); potatoes 161,512 tons (5.94); onions 8,466 tons (8.28); perennial rye grass 17,349,345 lb. (30.8); western wolths and Italian rye grass 4,171,136 lb. (376); cocksfoot 1,409,139 lb. (131). Livestock in dominion, 1944: horses 225,823; cattle 4,439,258 (including 1,647,920 dairy cows in milk); pigs 573,362 (including 77,281 breeding sows); sheep 33,200,298 (including 20,549,716 breeding ewes). Wool production, 1943-44: 330,000,000 lb. (on a greasy basis). Butterfat production, 1943-44: 387,800,000 lb.

Value of production, 1942-43: farming groups, £NZ 99,500,000; total £NZ169,800,000.

**Manufacturing.**—Factory production, 1942-43: number of establishments, 6,127; total number of employees, 114,590; salaries and wages paid, £NZ32,256,071; value of products, £NZ165,936,284; value of land, buildings, machinery and plant, £NZ288,253,772. (A. J. Hp.)

**NHA:** see HOUSING.

**Nicaragua.** A republic of Central America, situated between Honduras on the north and Costa Rica on the south. Area: 57,145 sq.mi., of which 3,475 sq.mi. is water. Pop. (off. est. as of Dec. 31, 1943) 1,048,642; by the 1940 census it was 983,160. Capital, Managua (1941 off. pop. est., 87,620); other urban centres are Chinandega (15,377); Granada (25,530); Jinotepe (9,556); León (31,799); and Masaya (21,070). Language: Spanish. President in 1945: General Anastasio Somoza.

**History.**—The press reported a few minor disturbances

against the government during 1945, one being a demonstration at the time of the visit of President Juan Antonio Rios of Chile on Nov. 9. In July President Somoza announced that any person who wished might become a candidate in the presidential election scheduled to take place in Aug. 1946, and also stated that he would present his own candidacy. The senate on Aug. 10, lifted the ban which prevented campaigning for elections more than ten months in advance. Late in November constitutional guarantees suspended during World War II were restored; emergency economic measures were continued, however. Martial law was ended Aug. 16, 1945.

Nicaragua took part in the Chapultepec and San Francisco conferences and carried out ratification of the United Nations charter on July 6—the first nation to approve the document. It was announced in June that a rubber purchase agreement with the United States would be extended until June 30, 1947.

The economic situation remained fairly satisfactory in 1945, although certain shortages continued to be felt. In January rice stocks were frozen and prices fixed, and sugar rationing was started in August. Two commissions to replace wartime agencies which had regulated commerce and quota matters were created Oct. 11. A new mining law and a new labour code became effective in April, making necessary some adjustments between labour and management, particularly in the mining industry. Organized labour paraded on May 1, for the first time in Nicaraguan history. In the summer the chamber of deputies approved a law providing that immigrants must settle in rural districts and engage in agriculture.

**Education.**—Primary schools in 1942 numbered 943, with an enrolment of 63,380 students (average attendance is lower, however). Eleven secondary schools had an enrolment of 2,750. Late in Nov. 1945, the minister of public instruction ordered industries employing more than 200 persons to establish night schools.

**Finance.**—The monetary unit is the córdoba, officially pegged at 20 cents U.S. in value. The national budget for 1945-46 was unofficially reported as set at 70,391,000 córdobas (1944-45: 54,114,871 córdobas). The public debt on March 24, 1945, was estimated at \$5,378,000 (U.S. currency). Total currency in circulation on June 30, 1945, amounted to 46,513,000 córdobas. On April 16 President Somoza told an opening session of congress that a budget surplus of \$1,600,000 existed.

**Trade and Resources.**—Exports for 1944 were valued at \$15,412,455, and imports at \$10,279,451; total trade was estimated to be 11% less than 1943. The exchange stabilization fund on June 30, 1945, amounted to about \$7,520,000, a decrease of 22% compared with June 30, 1944. On July 1 the rate on import duties and taxes payable at customhouses in Nicaragua was changed from four paper córdobas for one gold córdoba (the latter is equivalent to the U.S. dollar) to five for one, and in the same quarter the basic tax on the sale of foreign exchange was reduced from 10% to 5%. A decree of Oct. 15 removed need for import permits except for certain goods, and created a commission to regulate commerce.

Coffee production for the 1944-45 quota year amounted to 191,859 bags of 60 kg. each (1943-44: 223,370 bags). In April 1945 it was officially announced that the coffee quota for the year could not be completed. Sugar output for 1944-45 was estimated at about 25,500,000 lb.; sesame seed production at about 6,500,000 lb.; rice 12,000,000 lb.; beans 9,000,000 lb. (33% less than the previous year); corn 29,000,000 lb.; cotton 1,254,000 lb. Banana exports for the first half of 1945 amounted to 29,647 stems (for the first half of 1944: 1,557 stems). Production of gold in 1944 amounted to 219,579 troy oz. (1943: 219,189 troy oz.); silver output was 254,457 troy oz. (1943: 254,989 troy oz.).

**Communications.**—In 1944 Nicaragua had 258 mi. of railroad and about 3,000 mi. of highway, largely unimproved. Motor vehicle registration (1943) listed 1,172 passenger automobiles, and 312 trucks and buses. Air service is supplied by Transportes Aereos Centro Americanos (T.A.C.A.) and Pan American airways.

**Nickel.** The production of nickel in Canada declined from 144,009 short tons in 1943 to 137,299 tons in 1944. In the first 10 months of 1945 the total was 107,718 tons, equivalent to an annual output of 129,300 tons.

Almost the entire United States supply is derived from imports, mostly from Canada. The domestic output was 642 tons in 1943 and 988 tons in 1944, while secondary recovery was 6,917 tons in 1943 and 4,321 tons in 1944. Imports decreased from 122,492 tons in 1943 to 118,293 tons in 1944, of which 107,950 tons were from Canada, 7,000 tons from New Caledonia, 3,000 tons from Cuba, 800 tons from England and small amounts from other sources.

The Falconbridge plant in Norway was found to be intact after the German surrender, and operation was expected to resume as soon as a supply of matte could be provided. During the German occupation the Falconbridge matte was treated by International Nickel Co. in Canada.

The Patchang plant (the former Finnish development of International Nickel at Petsamo) was being restored after destruction during the German occupation. In New Caledonia the contract for the sale of nickel to the United States expired in June 1944, but most of the output would continue to go there; production was expected to continue at prewar level. In mid-1945 a new electrolytic plant was reported to be about ready to start operation at Monchegorsk, on the Kola peninsula, U.S.S.R. A former plant there was destroyed when the Germans invaded the area. The mines were reopened in 1942, shipping ore to treatment plants in Siberia; production of crude nickel was resumed in 1944, and electrolytic refining was to be added.

**Nigeria:** see BRITISH WEST AFRICA.

**Nimitz, Chester William** (1885- ), U.S. naval officer, was born Feb. 24 in Fredericksburg, Tex., and was graduated from Annapolis in 1905. An experienced submarine officer, during World War I he was chief of staff to the commander of the Atlantic fleet's submarine force. He was promoted to rear admiral, June 23, 1938. On Dec. 17, 1941, after the surprise attack on Hawaii, Admiral Nimitz was made commander in chief of the Pacific fleet, with the rank of admiral. The U.S. Pacific fleet, weakened by the blow at Pearl Harbor, was a mere skeleton when Nimitz assumed his post at Pearl Harbor, Dec. 31, 1941. Nimitz quickly reorganized his combat teams and strategy and then built up a group of leaders, including Halsey, Mitscher, Turner, Spruance and Kinkaid. Nimitz's command of the Pacific ocean area placed army and marine units as well as naval forces under his authority. Under his command, U.S. armed forces conquered the Solomons, 1942-43, the Gilbert Islands in 1943, and the Marshalls, Marianas and Palau in 1944 and Iwo Jima in 1945. Nimitz was promoted Dec. 15 to the five-star rank of fleet admiral of the U.S. navy. He supplied the huge naval forces that participated in the Leyte and Luzon campaigns (1944-45) and directed the opening phase of the Okinawa invasion (1945).

Nimitz attended the Japanese surrender ceremonies aboard the battleship U.S.S. "Missouri" in Tokyo bay, Sept. 2. He asserted (Sept. 21) that the atomic bomb merely emphasized the value of seapower insofar as the bomb depended "on planes and planes depended on seapower's securing and holding the bases for them." Like the vast majority of naval officers, Nimitz opposed the merger of the armed services. On Nov. 20, he was named chief of naval operations, succeeding Adm. King. He assumed office Dec. 15.

**Nitrogen, Chemical.** Chile still remained the only source of natural nitrates in any appreciable quantity, but the once predominant position of this form of chemical nitrogen was gradually usurped by other forms—first by ammonia from by-product coke ovens, and later to an even greater extent by ammonia and nitric acid synthesized from air nitrogen. During World War II shipments from Chile were hampered by shortage of transportation, but actual losses en route were small. U.S. imports from Chile (761,165 short tons in 1943 and 712,434 tons in 1944) were used almost entirely for fertilizers, leaving the nitrogen requirements of the munitions program to be supplied by synthetic nitrogen. As of Jan. 1, 1946, there was little information available concerning the synthetic industry.

The by-product coking of coal in the United States yielded 761,270 tons of ammonium sulphate in 1943 and 818,244 tons in 1944, besides 34,106 tons and 31,665 tons respectively of ammonia content of ammonia liquors.

Other forms of nitrogen that are imported in appreciable amounts are calcium cyanamide, ammonium sulphate, ammonium nitrate, ammonium phosphate and sodium-potassium nitrate.

**Nobel Prizes:** see PRIZES OF 1945.

**North Borneo:** see BORNEO.

**North Carolina.** A south Atlantic coast state, popularly known as the "Old North state" or the "Tar Heel state," North Carolina is one of the original 13 states of the union; area 52,712 sq.mi. (49,142 sq.mi. land, 3,570 sq.mi. water); pop. (1940) 3,571,623, of which 974,175 (27.3%) were urban, 2,597,448 (72.7%) rural and 1,005,501 (28.2%) nonwhite. On July 1, 1944, the bureau of the census estimated the civilian population of the state at 3,534,545. Capital, Raleigh (46,897); other cities: Charlotte (100,899); Winston-Salem (79,815); Durham (60,195); Greensboro (59,319); Asheville (51,310).

**History.**—In January R. Gregg Cherry was inaugurated governor. For the most part his recommendations were adopted by the second wartime legislature of North Carolina after 1865 in a 67-day session characterized by relative harmony, caution and conservatism. Impressed by the uncertainty of the future, the legislature made no major changes in the tax structure; no major increases for operating expenses; and no major appropriations for expansion. It left intact the \$20,000,000 postwar reserve fund, set up in 1943, with the exception of earmarking \$5,000,000 for veterans' needs; and its first major act was to set aside about \$52,000,000 from the surplus, a sum adequate to retire all of the general fund bonded indebtedness. Record-breaking annual appropriations of \$116,000,000 were held within estimated revenue. The 3% sales tax was removed from some items but the tax on wine was sharply increased. The salaries of teachers and state employees were slightly increased; the compulsory school attendance age was raised from 14 to 16

years; and, pursuant to the new constitutional amendment, a new state board of education was established and given control over public school funds. New insurance laws greatly strengthened the power of the department of insurance. The state was made a self-insurer of its property from loss by fire, and a Veterans' commission was created to assist North Carolina veterans in securing all available legal rights and benefits. The legislature submitted to a popular referendum a proposed constitutional amendment allowing equal rights for women, including jury service, and endorsed an elaborate program for a four-year medical school at the university and a state-wide system of hospitals, health centres and clinics but made only a contingent appropriation of \$1,000,000 to aid in the hospitalization of indigent sick.

Josephus Daniels' *The Wilson Era* was awarded the Mayflower Society Cup for the best 1945 book by a North Carolinian.

State officers in 1945 were R. Gregg Cherry, governor; L. Y. Ballentine, lieutenant governor; Thad Eure, secretary of state; George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction; Harry McMullan, attorney general; W. P. Stacy, chief justice.

**Education.**—In 1943-44 there were 3,512 public elementary schools with 19,755 teachers and principals and 699,965 enrolled pupils; 980 public high schools with 6,174 teachers and principals and 133,650 enrolled pupils; these were operated at a cost of \$44,773,369, approximately four-fifths of which was contributed by the state government. The state provided bus transportation for 311,249 school children at an average cost of \$8.67 per pupil.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—In Oct. 1945 public grants amounting to \$430,254 were made to 32,804 persons for old-age assistance; \$156,063 to 6,032 families for aid to dependent children; \$46,413 to 2,396 blind persons; and \$29,951 to 2,502 cases for general relief (by the county governments). During the year ending June 30, 1945, the total amount of public relief funds distributed was approximately \$7,200,000; and during 1945 unemployment benefits amounted to \$1,839,959.34. In 1945 the state maintained 9 charitable institutions with 9,598 inmates on Nov. 1; 6 correctional institutions with 864 inmates; and state highway prison camps with 6,177 prisoners.

**Communications.**—In 1945 the state highway and public works commission maintained 11,289 mi. of state highways, of which 9,910 mi. were hard-surfaced; and 49,441 mi. of county roads, of which 2,588 mi. were hard-surfaced. There were 4,581 mi. of railroads, 324 mi. of city bus routes, 10,277 mi. of passenger bus routes, and 11,525 mi. of freight vehicle routes in 1944.

**Banking and Finance.**—On June 30, 1945, there were 45 national banks with resources of \$416,453,000, and 182 state banks with deposits of \$1,132,425,601 and resources of \$1,203,142,411. On Jan. 1, 1945, there were 147 building and loan associations operating under state charters with total assets of \$91,803,821. In 1944-45 state receipts were \$401,575,457; disbursements, \$389,866,928. On June 30, 1945, the state gross bonded and net debts were \$109,521,500 and \$34,764,075, respectively. The assessed value of property was \$2,760,261,628 in 1943. In the state general fund there was a cash surplus of about \$6,000,000 at the end of 1945.

**Agriculture.**—The total value of agricultural production harvested from about 6,400,000 ac. in 1945 was approximately \$620,000,000, of which tobacco accounted for \$360,043,000 and cotton \$47,300,000. North Carolina produced 40% of all the tobacco and 68% of all flue-cured tobacco grown in the United States. The cash income of North Carolina farmers in 1944 was

\$504,044,000 from crops; \$107,371,000 from livestock and livestock products; and \$16,421,000 from government payments. The value of the lands and buildings on the 278,276 farms in 1940, 44% of which were operated by tenants, was \$736,708,125.

Table I.—Leading Agricultural Products of North Carolina, 1945 and 1944

Crop	1945 (est.)	1944	Value 1945
Tobacco, lb.	819,790,000	752,956,000	\$360,043,000
Cotton, bales	430,000	710,000	47,300,000
Corn, bu.	55,650,000	51,018,000	77,910,000
Tame hay, tons	1,281,000	1,150,000	35,996,000
Peanuts, lb.	287,850,000	343,910,000	26,194,000
Wheat, bu.	6,216,000	8,560,000	10,319,000
Sweet potatoes, bu.	7,260,000	8,625,000	14,520,000
Irish potatoes, bu.	9,240,000	6,970,000	15,708,000
Oats, bu.	9,128,000	8,151,000	8,398,000
Soybeans, bu.	2,700,000	2,058,000	5,940,000
Lepedeza seed, lb.	45,400,000	40,700,000	4,767,000
Peaches, bu.	2,172,000	2,698,000	5,104,000
Apples, bu.	252,000	1,782,000	718,000
Pecans, lb.	2,814,000	2,300,000	840,000

**Manufacturing.**—In 1939 manufacturing establishments numbering 3,225 employed 270,210 wage earners at wages of \$199,289,501 and made products valued at \$1,421,329,578. The principal industries were tobacco products, cotton goods and furniture. Continuing war needs maintained North Carolina's industrial production in 1945 at about \$2,000,000,000.

**Mineral Production.**—The mineral production for North Carolina in 1943 was \$22,172,000. In quantity production of mica, feldspar and bromine, North Carolina ranked first among the states; but in value of all minerals produced, it ranked 32nd in 1943. The value of gold produced in 1942 was \$142,695, an increase of 26% over that in 1941.

Table II.—Principal Mineral Products of North Carolina, 1944, 1943, 1942 and 1941

Mineral	Value, 1944	Value, 1943	Value, 1942	Value, 1941
Stone	\$5,975,951	\$5,376,600	\$3,774,472	\$4,806,623
Clay products	2,700,000	3,000,000	4,000,000	5,356,000
Sand and gravel	1,405,917	1,823,516	2,491,820	2,345,165
Feldspar (crude)	778,007	656,182	533,448	552,386
Mica	2,280,910	2,288,691	991,194	587,379

## North Dakota.

A west north central state of the United States, admitted to the union Nov. 2, 1889. Popular name, "Flickertail State." Land area, 70,054 sq.mi.; water area, 611 sq.mi. Population (1940), 641,935; rural 510,012; urban 131,923. On July 1, 1944, the bureau of the census estimated the civilian population of North Dakota at 528,071. Capital, Bismarck (15,496). Chief cities, Fargo (32,580); Grand Forks (20,228); and Minot (16,577).

**History.**—Senator John Moses (Dem.), who replaced Gerald P. Nye (Rep.), died on March 3, 1945, and Gov. Aandahl appointed Milton R. Young to fill the unexpired term. Chief state officers in 1945 were: governor, Fred G. Aandahl; lieutenant governor, C. P. Dahl; secretary of state, Thomas Hall; auditor, Berta E. Baker; treasurer, Otto Krueger; attorney general, Nels G. Johnson; superintendent of public instruction, Arthur E. Thompson; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl; public service commissioner, C. W. McDonnell; tax commissioner, John Gray.

**Education.**—School teaching positions, June 1945, numbered 5,111 (elementary) and 1,497 (high school). Enrolment, elementary (88,378); secondary (27,154). Buildings used were: one- and two-room (3,043); graded elementary (218); combinations of high school and elementary grades (443).

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Public assistance in the year ended June 30, 1944, was \$4,235,667; average number aided per month, 18,216. Types of aid, old age, \$2,791,806, with 8,987 persons aided;

care of dependent or foster-home children, \$896,382, with 5,031 persons; blind, \$43,645, with 126 persons; other, \$503,834, with 1,452 persons. Cost of operating four charitable and four correctional institutions, biennium ending June 30, 1947, was expected to reach \$4,500,000. Average number of patients, estimated for 1945: Grafton, (feeble-minded), 960; school for blind, 30; school for deaf, 90; tuberculosis sanatorium, 235 and the four correctional institutions, 2,470 persons.

**Communications.**—Mileage of state highways, Jan. 1, 1945, was 7,103.6; rural, 107,066. Net expenditures, highway department, for the year ended June 30, 1945, for constructing and operating state highways, \$4,007,949.92; additional apportioned to counties, \$1,323,379.53. Railway mileage, Jan. 1, 1945, 5,271.7.

**Banking and Finance.**—One trust company and 110 state banks, as of June 30, 1945, had total resources of \$229,466,000 and deposits of \$216,743,000. Total resources of 42 national banks (four with trust powers), \$184,724,000; deposits \$175,776,000. Six federal savings and loan associations, Dec. 30, 1945, had estimated total resources of \$5,306,184 and a total share capital of \$4,917,465. Twelve state building and loan associations, Dec. 30, 1945, had estimated total resources of \$13,531,636 and total share capital of \$12,234,658. State treasury receipts, year ended June 30, 1945, \$39,530,307; expenditures \$40,397,140; bonded indebtedness, June 30, 1945 \$18,964,350.

**Agriculture.**—Total farm acreage, 1943, was 17,534,000 (excluding wild hay). Cash income from crops and livestock, 1944, \$500,000,000, of which \$183,900,000 was from livestock. Benefit payments for soil building in 1944 were \$6,000,000.

Table I.—Leading Agricultural Products of North Dakota, 1944 and 1943

Crop	1944	1943
Spring wheat (other than durum), bu.	131,660,000	121,486,000
Durum wheat, bu.	27,970,000	32,670,000
Corn, bu.	35,250,000	25,335,000
Oats, bu.	*	70,924,000
Barley, bu.	63,155,800	63,648,000
Rye, bu.	1,814,000	4,014,000
Flax, bu.	6,694,900	15,052,000
Potatoes, bu.	*	22,100,000

\*No figures available.

**Manufacturing.**—Total estimated value of manufacturing, 1944, \$43,767,082. Total employment, 4,800; wages paid \$4,204,192. Value of creamery butter, 1944, \$34,500,000; flour and grain mill products produced from wheat, year ending Sept. 1, 1945, \$22,010,612.

**Mineral Production.**—Production from 184 lignite mines (3 new), year ending June 30, 1944, was 2,515,823 tons of coal valued at \$3,715,568.97. Number of closed mines, 57. Number employed: 811 miners; 379 others. One new coal field opened in 1944. Natural gas produced from four wells in Bowman county in 1944 was 200,105,000 cu.ft. Total yield from seven wells in 1943 was 177,000,000 cu.ft. (A. V. O.)

**Northern Ireland:** see IRELAND, NORTHERN.

**Northern Rhodesia:** see RHODESIA.

## Northern Territory

OF AUSTRALIA. Area 523,620 sq.mi.; pop. (June 30, 1940): aboriginals, full-blooded 13,901; half-caste 902; white (est. Dec. 31, 1943) 14,445. Capital, Darwin (pop. Dec. 31, 1941, 4,400).

**History.**—The federal government in 1945 passed a bill to empower it to acquire all privately-owned land in and around Darwin. The government intended to develop Darwin as a modern military and air base. The new city was to be laid out according to the latest methods of town planning and the most modern airport in the southern hemisphere was planned with special tourist accommodation.

**Finance.**—Revenue (1943-44), ordinary \$170,000; from Central Australian railway \$6,500,000; from North Australian railway \$2,800,000. Expenditure (1943-44), ordinary appropriation \$925,000; new works, etc., \$375,000. (£A1=\$3.21 U.S.)

**Production and Communication.**—Production (1939-40): pastoral industry \$1,880,000; gold \$750,000; wolfram \$150,000; pearl shell \$51,000. Railways, government (Dec. 31, 1944) 508 mi. (W. D. MA.)

## Northwestern University.

An institution of higher learning at Evanston and Chicago, Ill. The university comprises the following divisions: the college of liberal arts, the graduate school, the technological institute and the schools of music, education, speech, commerce and journalism, all located in Evanston (a suburb of Chicago)

on a campus bordering Lake Michigan; the medical, law and dental schools and the evening departments of the university, all on Chicago's near north side, on a campus six blocks from the loop business district. A total of 2,187 degrees and diplomas were awarded during the year 1944-45.

For the fiscal year ending Aug. 31, 1945, gifts to the university totalled \$3,284,800, exclusive of certain sums received from the estate of Walter P. Murphy, founder of the technological institute. The budget of the university was \$9,080,000.

A new program for the education of teachers, employing units of study instead of traditional courses and placing greater emphasis on a liberal education, was inaugurated in the school of education. It was modelled after a new program of study for the bachelor of arts degree established the year previously in the college of liberal arts.

Military training at the university tapered off until at the end of the school year only the naval R.O.T.C., supply corps, and V-12 programs remained, with 700 men in residence. Altogether the university gave war training to approximately 50,000 men and women in 13 different types of programs. Of the total, 36,124 consisted of naval trainees, with 6,210 trained in the naval radio operators' school on the Evanston campus, and 24,570 in the naval midshipmen's school on the Chicago campus. In addition the university conducted a broad program of confidential research for the government, sent 400 members of the faculty and staff into military or governmental service and was represented by more than 11,000 alumni in military service, of whom 280 lost their lives.

The university was in 1945 making plans for its centennial, to be celebrated in 1951. Included in those plans was a program for a substantial increase in endowment and the erection on the Evanston and Chicago campuses of \$30,000,000 worth of new buildings. (For statistics of enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

**Northwest Territories.** The Northwest Territories in Canada comprise the regions formerly known as Rupert's land and the Northwestern territory, except those portions which form the provinces of Manitoba, Saskatchewan and Alberta and the Yukon territory, together with all British territories and possessions in North America and all islands adjacent thereto, not included within any province. The exception is the colony of Newfoundland and its dependencies. Area, 1,309,682 sq.mi.; pop. (1941 census) 12,028; seat of government, Ottawa, Ont. For administrative purposes, the territories in 1918 were subdivided into the provisional districts of Mackenzie, Keewatin and Franklin. The Northwest Territories act (1927) provided for a territorial government composed of the commissioner of the Northwest Territories, the deputy commissioner and five councillors appointed by the governor general in council. The Northwest Territories council in 1945 was composed as follows:—Commissioner, Charles Camsell; deputy commissioner, R. A. Gibson; members of council, A. L. Cumming, K. R. Daly, R. A. Hoey, S. T. Wood.

**Transportation and Communication.**—Inland water transportation on the Mackenzie river system from railhead at Waterways, Alta., to points in the Mackenzie district was provided by three companies, two of which maintained passenger services. Regular commercial air services, which also carry mail, were maintained from Edmonton, Alta., to the principal settlements. Negotiations were completed for the construction in 1946 of a new all-weather road which would link Hay River post, N.W.T. on Great Slave lake, with railhead at Grimshaw, Alta. Medical centres, trading posts and other places in the eastern Arctic were served by the annual supply ship from

ELDORADO Mining & Refining at Port Radium, Northwest Territories, photographed in Aug. 1945. The pitchblende-silver properties located here constitute one of the principal world sources of uranium, the element vital in atomic research

Montreal, Que., which also carried mail. Auxiliary boat services from railhead at Churchill, Man., were also provided. Radio communication was maintained between important settlements and trading posts in the territories and outside points through government and private commercial radio stations.

**Fur Trade.**—Fur trade and mining are the principal industries of the territories. The value of pelts harvested for the year ended June 30, 1944, was \$2,199,132. Fur trading is controlled by regulation and is open only to those who have been issued permits and who have established permanent posts. Natives and half-breeds living the life of natives enjoy free hunting and trapping privileges. Of the white residents, only those who, under the regulations, are included in an established eligible list are permitted to hunt and trap, and such individuals require an annual licence. Reindeer herding in the northern Mackenzie district was continued in the interests of the native population.

**Mineral Production.**—Mining activity in the territories in 1945 included the production of pitchblende concentrate (from which radium and uranium are extracted), gold and petroleum. Wartime developments in the field of atomic research directed new attention to the importance of the pitchblende-silver properties of Eldorado Mining and Refining, Ltd. on Great Bear lake as one of the principal world sources of uranium. The mine, which forms part of the assets operated as a crown company after Jan. 1944, was worked at capacity in 1945, in the production of concentrates which are refined at Port Hope, Ont. Figures relating to the tonnages of ore mined, milled and shipped were treated as confidential.

Increased activity in the Yellowknife mining district included prospecting for gold and staking on a wide scale, and more than 15,000 claims were in good standing by midsummer of 1945. Diamond drills were used extensively for surface exploration, and removal in June of wartime restrictions on the sinking of new shafts permitted a number of companies to undertake underground exploration. The shortage of labour which brought about the shutdown of all producing gold mines in 1944 showed some improvement in 1945, and as a result the Negus mine recommenced milling gold in July. Other developments in the Yellowknife area included the investigation of hydroelectric power sites on the Snare and Lockhart rivers with a view to supplementing existing facilities; construction of a new landing field capable of accommodating wheel-equipped aircraft; improvement and extension of roads serving mining properties, and the survey of an extension to the townsite of Yellowknife.

Production of petroleum at Norman Wells in the lower Mackenzie basin, which reached a new high in 1944, declined in 1945 following termination of drilling and production of crude oil for the Canol project, on orders of the United States government. From the inception of the Canol project in May 1942, until March 8, 1945, a total of 61 new producing wells were brought in. Sufficient wells were left in operation to meet the needs of a small refinery at Norman Wells which supplied the petroleum products requirements of Mackenzie district, and the remainder were capped. Up to March 8, 1945, when oil production for the Canol project stopped, the cumulative production of the Norman Wells field was 1,977,342 bbl. Of this amount, 118,895 bbl. were produced prior to May 1942. The pumping of oil through the Canol pipeline from Norman Wells to Whitehorse, Yukon Territory, and the operation of the refinery at White-

horse were terminated about April 1, 1945. Explorative drilling, on a small scale, was continued in the vicinity of Norman Wells.

**Field Surveys and Investigation.**—An extensive program of field investigation was continued in 1945 in the territories by various Canadian government departments. Work undertaken in the Mackenzie district included geological reconnaissance and mapping, topographical and hydrographic surveys, horticultural and soil surveys, investigation of fisheries, and surveys necessary for the improvement of navigation on the Mackenzie river waterway. (R. A. G.)

**Norway.** A democratic monarchy of northern Europe, bounded N. by the Arctic ocean, E. by Finland and Sweden, S. and W. by the North sea. Area 124,556 sq.mi.; pop. (est. 1939) 2,921,000. Capital, Oslo (253,124). Other principal cities, with 1930 populations, are Bergen (98,303); Trondheim (54,458); and Stavanger (46,780). Religion, Lutheran Christian. Ruler in 1945: King Haakon VII. Prime Minister: Einar Gerhardsen.

**History.**—As warning prelude to 1945, a flight of bombers from Great Britain raided Oslo gestapo headquarters in Victoria terrace on New Year's Eve 1944 (to 1945). While some damage was done to the building and a few Germans were killed, there were also 75 Norwegians killed because the Germans had not given them the air-raid warning.

The reconquest of northern Norway, partly by Norwegian troops trained in Great Britain or Sweden, pushed forward vigorously. The Russians had freed Kirkenes but refrained from driving deep into the devastated country. Dean Arne Fjellbu, banished from Trondheim because of a demonstration of popular disobedience to the nazis, was appointed bishop of the liberated northern area, and preached his first sermon on Jan. 14. The Norwegian troops had reconquered the land down into northern Troms province by May 8, when the Germans surrendered. Home front forces, meantime, had committed extensive sabotage of mines and factories and effectively wrecked much of the transportation system so as to prevent the nazi troops from being moved. This entailed expensive destruction in a country whose ruggedness made engineering projects difficult. Bombings and blockade added to the problems of the invaders, and to the eventual reconstruction problems of the Norwegians.

By May 8 the people felt repaid for their tenacious resistance. On that day the German major-generals, Frantz Böhme and Holte, signed the terms of surrender with Brigadier General R. Hilton of the Allied Control commission. Thus ended fears of a desperate nazi "last stand" in Norway. Church bells rang throughout the land and the Norwegians gave themselves to rejoicing. Crown Prince Olav, as commander in chief of Norwegian military forces, broadcast orders from London placing Norwegian troops under Allied command, and complete coordination was maintained. The 1,200 patriot prisoners were released from the notorious Grini concentration camp and many more from the smaller concentration camps scattered through the country. "Möllergaten 19" was emptied of its political prisoners, some under sentence of death. Vidkun Quisling was thrust into one of the vacant cells as a common prisoner, despite his demands for special treatment. Reichscommissar Josef Terboven and S.S. Lt. Gen. W. Rediess committed suicide, as did Jonas Lie and Henrik Rogstad, heads of the Quisling police system. There were 17,000 Norwegians arrested for treason, while the vast majority of the people gloried in their liberation.

It was found in May that about 350,000 German soldiers remained in Norway. They were brought into camps and by July were being transported out at the rate of 25,000 per week. The 74,000 Russian slave labourers were sent home and of the 15,000 Russian troops who had occupied Finnmark the last evacuated among scenes of mutual gratitude on Sept. 25. By the middle of October the 4,700 U.S. troops, who had come in after May 8, also departed—many of these were of Norwegian ancestry and

70 had married Norwegian girls. A more serious problem was the large number of children born to Norwegian girls of German fathers. The government frankly took responsibility for allowing these children to be adopted and protected and partially supported by the state. Girls who wished were to be allowed to go to Germany to marry.

Quisling, who had given his name to the languages of the world as synonym for a special 20th century brand of treason, was brought to trial in the Norwegian courts. He defended himself vehemently, but on Sept. 10 was convicted of treason, murder and theft. It was decided that he had plotted with the Germans for the invasion of Norway and had been responsible for the deaths of 1,000 Norwegian Jews and 100 citizens who had resisted the invasion and whose pardon he had refused. The supreme court upheld the verdict on Oct. 13; Mrs. Quisling's special appeal was denied by the cabinet on Oct. 22; and the puppet leader was executed at Akershus fortress, 2:40 A.M., Oct. 24. The death penalty, long forbidden in Norwegian law, had been established by decree of the government-in-exile, Oct. 3, 1941, and confirmed by the storting on June 29, 1945.

Reconstruction, after five years of occupation marked from the first by bitterness, bloodshed and destruction, was hard. Areas such as Finnmark had been "scorched"—there only two churches stood in the whole province, and few homes. Prefabricated houses from Sweden could only begin to fill the need, and people lived in crowded and primitive conditions. Transportation was extremely difficult, electric power plants had been destroyed, cattle and sheep were gone, fishing boats destroyed. But the Norwegians went to work to rebuild their beloved land, ordered new ships and were confident of the future.

Normal political life was re-established in Norway more quickly and more smoothly, probably, than in any of the other occupied countries. On May 13 Crown Prince Olav arrived in Oslo, with three of the ministers of the government-in-exile from London (Terje Wold, Oscar Torp and Sven Nielsen). On May 14 the home front leaders formally handed over authority to Olav. On the last day of May president of the storting, Carl J. Hambro, Prime Minister Nygaardsvold and the other ministers arrived; on June 7, exactly five years from the day he had left Norway, King Haakon sailed in on the "Heimdal," the royal yacht on which he had come to Norway in 1907. The political legalities were all intact due to a far-sighted constitutional provision and to the meeting of the storting at Elverum on April 9, 1940, when the government was empowered to take any decisions necessary, wherever it might be.

The Nygaardsvold government, in power from 1935, resigned as it had promised on June 12. Chief Justice Paal Berg, highest leader of the underground, was asked to form a government, but could not satisfy himself and the parties. Einar Gerhardsen, mayor of Oslo and member of the Labour party, then formed an interim government, to serve until elections. Soon thereafter (July 24) the Communist and Labour parties amalgamated, and in the elections on Oct. 8 won a clear majority. Gerhardsen reconstructed the cabinet so that after Nov. 8 it was constituted of the following ministers and their departments: Einar Gerhardsen, prime minister; Trygve Lie, foreign affairs; Kaare Fostervoll, church and public instruction; Oscar Torp, supply (formerly defense); Lars Evensen, commerce; Sven Oftedal, social affairs (these carrying over from the interim government, the rest new); Jens C. Hauge, defense; Erik Brofoss, finance; Oscar C. Gundersen, justice; Kristian Fjeld, agriculture; Nils Langehelle, public works; and the following consultative ministers, all new: Aaslaug Aasland, social affairs; Reidar Carlsen, fisheries; Peder Holt, reconstruction. This was the youngest cabinet in Norwegian history, with five of the ministers under 38 and the average age 44.

HOODED Norwegian informer identified Gestapo agents from among the Norwegian regular army at Oslo in 1945. Behind him were Allied intelligence troops prepared to take charge of prisoners

Norway participated in the San Francisco conference with an able delegation led by Trygve Lie, C. J. Hambro and W. M. Morgenstierne. The government was eager to create a working broad international organization, and shied away from regional blocs.

Rapid rebuilding of the country was the foremost aim of government and people. Trade negotiations were pushed, plans were drawn for re-establishing the whaling industry and the merchant fleet, increasing power production and rebuilding the farm lands. The University of Oslo opened its doors, closed from 1943, to more than 1,000 students, and scores went abroad to Great Britain and the U.S. for special training.

**Education.**—In 1937-38 there were 357,793 students and 10,521 teachers in the elementary schools; 31,127 students and 1,809 teachers in the middle schools and gymnasia, and 16,033 students in continuation schools. The 11 schools of university rank had a combined enrolment of 4,998. The total state budget for educational purposes in 1939-40 was 65,364,000 kr.

**Finance.**—The monetary unit is the krone (23.2 U.S. cents in 1939). Budgetary income and expenses for 1937-38 balanced at 572,135,000 kr. The government, while in London, received a large income from the merchant marine, requisitioned early in World War II.

**Trade.**—In 1939 exports were valued at 808,172,000 kr.; imports, 1,361,835,000 kr. In 1945 foreign trade was carried on through government organizations, but plans were announced in December for transferring the British and U.S. trade to private channels. By strenuous efforts the merchant fleet was being rapidly re-established. Trade loans were negotiated abroad—such as the \$50,000,000, 3% to 3½% loan through the U.S. Export-Import bank.

**Communication.**—In 1939 there were 2,335 mi. of state railways and 26,677 mi. of highways (11,857 mi. improved, 13,820 unimproved). In 1938 there were 107,657 motor vehicles. Norwegian air lines flew a total of 85,000 mi. in 1938. Telephones numbered 122,664; telegraph lines extended 21,875 mi.;

radio receivers (licensed) numbered 400,623.

**Agriculture.**—The total value of agricultural products in 1938 was 384,207,000 kr.; of animal products (eggs, milk, wool, etc.), 428,000,000 kr.; furs, 30,000,000 kr. Landholdings numbered 562,407 (298,360 operating units) with a value of 2,410,101,000 kr. Leading crops were wheat 15,791,000 kr., rye 2,197,000 kr., barley 22,382,000 kr. and oats 31,479,000 kr. In 1938 total productive forest area was one-quarter of the total land area, or 18,700,000 ac. Herds were reduced at least 15% during World War II, and farms were often badly neglected.

**Fisheries.**—The total catch of fish in 1938 was 1,174,000 short tons, plus 1,089,000 tons of whale oil; of the fish, 763,000 tons were herring of various kinds. The 1944 catch was considerably smaller than normal and the Germans demanded 75%-95% of it. Conditions improved in 1945, but the fishing fleet was much depleted.

**Manufacturing.**—In 1937 there were 4,306 establishments which turned out products valued at 2,023,551,000 kr. According to value of the product, the most important industries were food and tobacco 411,109,000 kr., paper, cellulose 309,733,000 kr., iron and metal 308,169,000 kr., mining 216,511,000 kr., textile 144,488,000 kr. and wood, furniture, etc. 140,756,000 kr.

**Mineral Production.**—In 1938 the principal mineral product was iron ore, valued at 26,665,000 kr. Pyrites, valued at 18,168,000 kr. and copper, valued at 5,013,000 kr., were respectively the second and third minerals. (F. D. S.)

**Nose:** see EAR, NOSE AND THROAT, DISEASES OF.

**Notre Dame, University of.** An institution of higher education at Notre Dame (South Bend), Indiana.

Outstanding in 1945 was the shift from war to peace programs. Notre Dame's World War II dead totalled 287. The U.S. Naval Reserve Midshipmen's school closed Nov. 2 after having commissioned more than 10,000 officers in its 11 classes during the war years. The N.R.O.T.C. absorbed most of the remaining 800 navy trainees in its own program, including a

few V-12 and V-5 men.

Enrolment in the five colleges at the end of 1945 totalled 2,855, including 591 returned veterans and 2,047 civilian students, two-thirds of normal civilian capacity.
